$$C = \pi r^2\left\{\frac{2}{y}\sin\frac{z^2}{2y} + \frac{\sin\frac{1}{2}y}{\frac{1}{2}y}V_0 - \frac{\cos\frac{1}{2}y}{\frac{1}{2}y}V_1\right\} . \quad . \quad . \quad (14),$$

$$S = \pi r^2\left\{\frac{2}{y}\cos\frac{z^2}{2y} - \frac{\cos\frac{1}{2}y}{\frac{1}{2}y}V_0 - \frac{\sin\frac{1}{2}y}{\frac{1}{2}y}V_1\right\} . \quad . \quad . \quad (15),$$

where

$$V_0 = J_0(z) - \frac{z^2}{y^2}J_2(z) + \frac{z^4}{y^4}J_4(z) - . \quad . \quad . \quad . \quad . \quad . \quad (16),$$

$$V_1 = \frac{z}{y}J_1(z) - \frac{z^3}{y^3}J_3(z) + \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (17).$$

These series are suitable when z/y is small.

When the primary wave is complete, $r = \infty$, and we have at once from the second set of expressions

$$C\infty = \frac{2\pi}{\kappa}\sin\frac{l^2}{2\kappa}, \; S\infty = \frac{2\pi}{\kappa}\cos\frac{l^2}{2\kappa} . \quad . \quad . \quad . \quad (18),$$

so that

$$I^2 = \frac{C\infty^2 + S\infty^2}{a^2b^2\lambda^2} = \frac{1}{(a+b)^2} \quad . \quad . \quad . \quad . \quad (19),$$

as we know it should be.

Shadow of circular disk.

In the application to the problem of the shadow of a circular disk the limits of integration are from r to ∞. If these integrals be denoted by C′, S′, we have

$$C' = C\infty - C = \pi r^2\left\{-\frac{\sin\frac{1}{2}y}{\frac{1}{2}y}V_0 + \frac{\cos\frac{1}{2}y}{\frac{1}{2}y}V_1\right\} . \quad . \quad (20),$$

$$S' = S\infty - S = \pi r^2\left\{\frac{\cos\frac{1}{2}y}{\frac{1}{2}y}V_0 + \frac{\sin\frac{1}{2}y}{\frac{1}{2}y}V_1\right\} . \quad . \quad . \quad (21);$$

and

$$C'^2 + S'^2 = \frac{4\pi^2}{\kappa^2}V_0^2 + V_1^2) \quad . \quad . \quad . \quad . \quad . \quad . \quad (22),$$

$$I^2 = \frac{V_0^2 + V_1^2}{(a+b)^2} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (23).$$

When the point where the illumination is required is situated upon the axis, ζ, l, z are zero. Hence $V_0 = 1, V_1 = 0$, and

$$I^2 = \frac{1}{(a+b)^2},$$

the same as if the primary wave had come on unbroken. This is Poisson's theorem, already found (§ 10) by a much simpler method, in which attention is limited from the first to points upon the axis. The distribution of light at other points upon the screen is to be found from (23) by means of the series (16), (17) for V_0 and V_1. Lommel gives curves for the the intensity when $y=\pi, 2\pi, 3\pi, \ldots 6\pi$. The bright central spot is accompanied by rings of varying intensity.

---

[1] Necker, *Phil. Mag.*, Nov., 1832; Fox Talbot; *Phil. Mag.*, June, 1733. "When the sun is about to emerge . . . . every branch and leaf is lighted up with a silvery lustre of indescribable beauty. . . . . The birds, as Mr. Necker very truly describes, appear like flying brilliant sparks." Talbot ascribes the appearance to diffraction; and he recommends the use of a telescope.

[2] *Abh. der bayer. Akad. der Wiss.*, ii. Cl., xv. Bd., ii. Abth.

[3] Used now in an altered sense.

The limit of the geometrical shadow $[\zeta/(a+b)=r/a]$ corresponds to $y=z$. In this case

$$V_0=J_0(z)-J_2(z)+J_4(z)-\ldots=\tfrac{1}{2}\left\{J_0(z)+\cos z\right\} \quad . \; . \quad (24),$$

$$V_1=J_1(z)-J_3(z)+J_5(z)-\ldots=\tfrac{1}{2}\sin z \quad . \; . \; . \; . \; . \; . \quad (25).$$

Condition of mathematical similarity.

The numbers computed for special values of y and z apply to a whole class of problems. Since

$$y=\frac{2\pi}{\lambda}\frac{a+b}{ab}\cdot r^2, \quad z=\frac{2\pi}{\lambda}\frac{\zeta}{b}\cdot r,$$

both y and z remain unchanged, even when λ is constant, if we suppose

$$b \propto a, \quad r \propto \zeta \propto \sqrt{a} \quad . \; . \; . \; . \; . \; . \quad (26).$$

We may fall back upon Fraunhofer's phenomena by supposing $a=b=\infty$, or more generally $b=-a$, so that $y=0$.

Under these circumstances

$$C=\pi r^2\frac{J_1(z)}{z}, \quad S=0.$$

But it is unnecessary to add anything further under this head.

§ 19. *Polarization.*

A ray of ordinary light is symmetrical with respect to the direction of propagation. If, for example, this direction be vertical, there is nothing that can be said concerning the north and south sides of the ray that is not equally true concerning the east and west sides. In polarized light this symmetry is lost. Huygens showed that when a ray of such light falls upon a crystal of Iceland spar, which is made to revolve about the ray as an axis, the phenomena vary in a manner not to be represented as a mere revolution with the spar. In Newton's language, the ray itself has *sides*, or is polarized.

Brewster's law.

Malus discovered that ordinary light may be polarized by reflection as well as by double refraction; and Brewster proved that the effect is nearly complete when the tangent of the angle of incidence is equal to the refractive index, or, (which comes to the same) when the reflected and refracted rays are perpendicular to one another. The light thus obtained is said to be polarized in the plane of reflection.

Reciprocally, the character of a polarized ray may be revealed by submitting it to the test of reflection at the appropriate angle. As the normal to the reflecting surface revolves (in a cone) about the ray, there are two azimuths of the plane of incidence, distant 180°, at which the reflection is a maximum, and two others, distance 90° from the former, at which the reflection (nearly) vanishes. In the latter case the plane of incidence is perpendicular to that in which the light must be supposed to have been reflected in order to acquire its polarization.

Double refraction.

The full statement of the law of double refraction is somewhat complicated, and scarcely to be made intelligible except in terms of the wave theory; but, in order merely to show the relation of double refraction in a uniaxal crystal, such as Iceland spar, to polarized light, we may take the case of a prism so cut that the refracting edge is parallel to the optic axis. By traversing such a prism, in a plane perpendicular to the edge, a ray of ordinary light is divided into two, of equal intensity, each of which is refracted according to the ordinary law of Snell. Whatever may be the angle and setting of the prism, the phenomenon may be represented by supposing half the light to be refracted with one index (1.65), and the other half with the different index (1.48). The rays thus arising are polarized,—the one more refracted in the plane of refraction, and the other in the perpendicular plane. If these rays are now allowed to fall upon a second similar prism, held so that its edge is parallel to that of the first prism, there is no further duplication. The ray first refracted with index 1.65 is refracted again in like manner, and similarly the ray first refracted with index 1.48 is again so refracted. But the case is altered if the second prism be caused to rotate about the incident ray. If the rotation be through an angle of 90°, each ray is indeed refracted singly; but the indices are exchanged. The ray that suffered most refraction at the first prism now suffers least at the second, and *vice versa*. At intermediate rotations the double refraction reasserts itself, each ray being divided into two, refracted with the above-mentioned indices, and of intensity dependent upon the amount of rotation, but always such that no light is lost (or gained) on the whole by the separation.

Law of Malus.

The law governing the intensity was formulated by Malus, and has been verified by the measures of Arago and other workers. If θ be the angle of rotation from the position in which one of the rays is at a maximum, while the other vanishes, the intensities are proportional to $\cos^2\theta$ and $\sin^2\theta$. On the same scale, if we neglect the loss by reflection and absorption, the intensity of the incident light is represented by unity.

A similar law applies to the intensity with which a polarized ray is reflected from a glass surface at the Brewsterian angle. If θ be reckoned from the azimuth of maximum reflection, the intensity at other angles may be represented by $\cos^2\theta$, vanishing when $\theta=90°$.

Transverse vibrations.

The phenomena here briefly sketched force upon us the view that the vibrations of light are transverse to the direction of propagation. In ordinary light the vibrations are as much in one transverse direction as in another; and when such light falls upon a doubly refracting, or reflecting, medium, the vibrations are *resolved* into two definite directions, constituting two rays polarized in perpendicular planes, and differently influenced by the medium. In this case the two rays are necessarily of equal intensity.

Consider, for example, the application of this idea to the reflection of a ray of ordinary light at the Brewsterian, or polarizing, angle. The incident light may be resolved into two, of equal intensity, and polarized respectively in and perpendicular to the plane of incidence. Now we know that a ray polarized in the plane perpendicular to that of incidence will not be reflected, will in fact be entirely transmitted; and the necessary consequence is that all the light reflected at this angle will be polarized in the plane of incidence. The operation of the plate is thus purely selective, the polarized component, which is missing in the reflected light, being represented in undue proportion in the transmitted light.

If the incident light be polarized, suppose at an angle θ with the plane of incidence, the incident vibration may be resolved into $\cos\theta$ in the one plane and $\sin\theta$ in the other. The latter polarized component is not reflected. The reflected light is thus in all cases polarized in the plane of reflection; and its *intensity*, proportional to the square of the vibration, is represented by $h\cos^2\theta$, if h be the intensity in which light is reflected when polarized in the plane of reflection. The law of Malus is thus a necessary consequence of the principle of resolution.

Elastic solid theory.

The idea of transverse vibration was admitted with reluctance, even by Young and Fresnel themselves. A perfect fluid, such as the ethereal medium was then supposed to be, is essentially incapable of transverse vibrations. But there seems to be no reason *a priori* for preferring one kind of vibration to another; and the phenomena of polarization prove conclusively that, if luminous vibrations are analogous to those of a material medium, it is to solids, and not to fluids, that we must look. An isotropic solid is capable of propagating two distinct kinds of waves—the first dependent upon *rigidity*, or the force by which shear is resisted, and the second analogous to waves of sound and dependent upon *compressibility*. In the former the vibrations are transverse to the direction of propagation, that is, they may take place in any direction parallel to the wave-front, and they are thus suitable representatives of the vibrations of light. In this theory the luminiferous ether is distinctly assimilated to an elastic solid, and the velocity of light depends upon the *rigidity* and *density* assigned to the medium.

Medium incompressible.

The possibility of longitudinal waves, in which the displacement is perpendicular to the wave-front, is an objection to the elastic solid theory of light, for there is nothing known in optics corresponding thereto. If, however, we suppose with Green that the medium is incompressible, the velocity of longitudinal waves becomes infinite, and the objection is in great degree obviated. Such a supposition is hardly a departure from the original idea, inasmuch as, so far as we know, there is nothing to prevent a solid material possessing these properties, and an approximation is actually presented by such bodies as jelly, for which the velocity of longitudinal vibrations is a large multiple of that of transverse vibrations.

§ 20. *Interference of Polarized Light.*

The conditions of interference of polarized light are most easily deduced from the phenomena of the colors of crystalline plates, if we once admit Young's view that the origin of the colors is to be sought in the interference of the differently refracted rays. Independently of any hypothesis of this kind, the subject was directly investigated by Fresnel and Arago,[1] who summarized their conclusions thus:

Laws of interference.

(1) Under the same conditions in which two rays of ordinary light appear to destroy one another, two rays polarized in contrary (viz., perpendicular) directions are without mutual influence.

(2) Two rays of light polarized in the same direction act upon one another like ordinary rays; so that with these two kinds of light, the phenomena of interference are identical.

(3) Two rays *originally polarized in opposite directions* may afterwards be brought to the same plane of polarization, *without thereby acquiring the power to influence one another.*

(4) *Two rays polarized in opposite directions, and afterwards brought to similar polarizations,* react in the same manner as natural rays, *if they are derived from a beam originally polarized in one direction.*

The fact that oppositely polarized rays cannot be made to interfere may of itself be regarded as a proof that the vibrations are transverse; and the principle, once admitted, gives an intelligible account of all the varied phenomena in this field of optics. The only points on which any difficulty arises are as to the nature of ordinary unpolarized light, and the rules according to which *intensity* is to be calculated. It will be proper to consider these questions somewhat fully.

Plane polarization.

In ordinary (plane) polarized light the vibrations are supposed to be in one direction only. If x and y be rectangular co-ordinates in the plane of the wave, we may take, as representing a regular vibration of plane-polarized light,

$$x = a \cos(\phi - \alpha) \quad . \quad . \quad . \quad . \quad . \quad (1),$$

where $\phi = 2\pi t/\tau$, and a, α denote constants. It must be remembered, however, that in optics a regular vibration of this kind never presents itself. In the simplest case of approximately monochromatic light, the amplitude and phase must be regarded (§ 4) as liable to incessant variation, and all that we are able to appreciate is the *mean* intensity, represented by $M(a^2)$. If a number of these irregular streams of light are combined, the intensity of the mixture cannot be calculated from a mere knowledge of the separate intensities, unless we have assurance that the streams are *independent*, that is, without mutual phase-relations of a durable character. For instance, two thoroughly similar streams combine into one of *fourfold* intensity, if the phases are the same; while, if the phases are opposed, the intensity falls to zero. It is only when the streams are independent, so that the phase-relation is arbitrary and variable from moment to moment, that the apparent resultant intensity is necessarily the double of the separate intensities.

If any number of independent vibrations of type (1) be superposed, the resultant is

$$[\Sigma a_1 \cos \alpha_1] \cos\phi + [\Sigma a_1 \sin \alpha_1] \sin\phi,$$

and the momentary intensity is

$$[\Sigma a_1 \cos \alpha_1]^2 + [\Sigma a_1 \sin \alpha_1]^2,$$

or

$$a_1^2 + a_2^2 + \ldots + 2a_1a_2 \cos(\alpha_1 - \alpha_2) + \ldots$$

The phase-relations being unknown, this quantity is quite indeterminate. But, since each cosine varies from moment to moment, and on the whole is as much positive as negative, the *mean* intensity is

$$M(a_1^2) + M(a_2^2) + \ldots,$$

that is to say, is to be found by simple addition of the separate intensities.

Elliptic polarization.

Let us now dispense with the restriction to one direction of vibration, and consider in the first place the character of a *regular* vibration, of given frequency. The general expression will be

$$x = a\cos(\phi - \alpha), \qquad y = b\cos(\phi - \beta) \quad . \quad . \quad . \quad (2),$$

where a, α, b, β are constants. If $\beta = \alpha$, the vibrations are executed entirely in the plane $x/y = a/b$, or the light is plane-polarized. Or if $\beta = \pi - \alpha$, the light is again plane-polarized, the plane of vibration being $x/y = -a/b$. In other cases the vibrations are not confined to one plane, so that the light is not plane-polarized, but, in conformity with the path denoted by (2), it is said to be *elliptically-polarized*. If one of the constituents of elliptically-polarized light be suitably accelerated or retarded relatively to the other, it may be converted into plane-polarized light, and so identified by the usual tests. Or, conversely, plane-polarized light may be converted into elliptically-polarized by a similar operation. The relative acceleration in question is readily effected by a plate of doubly refracting crystal cut parallel to the axis.

If $\beta = \alpha \pm \frac{1}{2}\pi$, whether in the first instance or after the action of a crystalline plate,

$$x = a\cos(\phi - \alpha), \qquad y = \pm b\sin(\phi - \alpha) \quad . \quad . \quad (3).$$

The maxima and minima values of the one co-ordinate here occur synchronously with the evanescence of the other, and the co-ordinate axes are the *principal* axes of the elliptic path.

Circular polarization.

An important particular case arises when further $b = a$. The path is then a circle, and the light is said to be *circularly*-polarized. According to the sign adopted in the second equation (3), the circle is described in the one direction or in the other.

Circularly-polarized light can be resolved into plane-polarized components in *any* two rectangular directions, which are such that the intensities are equal and the phases different by a quarter period. If a crystalline plate be of such thickness that it retards one component by a quarter of a wave-length (or indeed by any odd multiple thereof) relatively to the other, it will convert plane-polarized light into circularly-polarized, and conversely—in the latter case without regard to the azimuth in which it is held.

The property of circularly-polarized light whereby it is capable of resolution into oppositely plane-polarized components of equal intensities is possessed also by natural unpolarized light; but the discrimination may be effected experimentally with the aid of the quarter-wave plate. By this agency the circularly-polarized ray is converted into plane-polarized, while the natural light remains apparently unaltered. The difficulty which remains is rather to explain the physical character of natural light. To this we shall presently return; but in the meantime it is obvious that the constitution of natural light is essentially irregular, for we have seen that absolutely regular, *i.e.*, absolutely homogeneous, light *is necessarily* (*elliptically*) *polarized.*

In discussing the vibration represented by (2), we have considered the amplitudes and phases to be constant; but in nature this is no more attainable than in the case of plane-polarized light. In order that the elliptic polarization may be of a definite character, it is only necessary that the *ratio* of amplitudes and the *difference* of phases should be absolute constants, and this of course is consistent with the same degree of irregularity as was admitted for plane vibrations.

The intensity of elliptically-polarized light is the sum of the intensities of its rectangular components. This we may consider to be an experimental fact, as well as a consequence of the theory of transverse vibrations. In whatever form such a theory may be adopted, the energy propagated will certainly conform to this law. When the constants in (2) are regarded as subject to variation, the apparent intensity is represented by

$$M(a^2) + M(b^2) \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4).$$

Unpolarized light.

We are now in a position to examine the constitution which must be ascribed to natural light. The conditions to be satisfied are that when resolved in any plane the mean intensity of the vibrations shall be independent of the orientation of the plane, and, further, that this property shall be unaffected by any previous relative retardation of the rectangular components into which it may have been resolved. The original vibration being represented by

$$x = a\cos(\phi - \alpha), \qquad y = b\cos(\phi - \beta),$$

or, as we may write it, since we are concerned only with phase *differences*,

$$x = a\cos\phi, \qquad y = b\cos(\phi - \delta) \quad . \quad . \quad . \quad . \quad . \quad (5),$$

let us suppose that the second component is subjected to a retardation ϵ. Thus

$$x = a\cos\phi, \qquad y = b\cos(\phi - \delta - \epsilon) \quad . \quad . \quad . \quad (6),$$

in which a, b, δ will be regarded as subject to rapid variation, while ϵ remains constant. If the vibration represented by (6) be now resolved in a direction x', making an angle ω with x, we have

$$\begin{aligned} x' &= a\cos\phi\cos\omega + b\cos(\phi - \delta - \epsilon)\sin\omega \\ &= [a\cos\omega + b\sin\omega\cos(\delta + \epsilon)]\cos\phi + b\sin\omega\sin(\delta + \epsilon)\sin\phi; \end{aligned}$$

and the intensity is

$$a^2\cos^2\omega + b^2\sin^2\omega + 2ab\cos\omega\sin\omega\cos(\delta + \epsilon) \quad . \quad . \quad (7).$$

Of this expression we take the mean, ω and ϵ remaining constant. Thus the apparent intensity may be written

$$M(x'^2) = M(a^2)\cos^2\omega + M(b^2)\sin^2\omega + 2M[ab\cos(\delta + \epsilon)]\cos\omega\sin\omega \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (8).$$

---

[1] Fresnel's *Works*, vol. i. p. 521.

Necessary conditions.

In order now that the stream may satisfy the conditions laid down as necessary for natural light, (8) must be independent of ω and ϵ; so that

$$M(a^2) = M(b^2) \quad . \quad . \quad . \quad . \quad . \quad (9),$$

$$M(ab \cos \delta) = M(ab \sin \delta) = 0 \quad . \quad . \quad . \quad (10).$$[1]

In these equations a^2 and b^2 represent simply the intensities, or squares of amplitudes, of the x and y vibrations; and the other two quantities admit also of a simple interpretation. The value of y may be written

$$y = b \cos \delta \cos \phi + b \sin \delta \sin \phi \quad . \quad . \quad . \quad . \quad (11);$$

from which we see that $b \cos \delta$ is the coefficient of that part of the y vibration which has the same phase as the x vibration. Thus $ab \cos \delta$ may be interpreted as the product of the coefficients of the parts of the x and y vibrations which have the same phase. Next suppose the phase of y accelerated by writing $\frac{1}{2}\pi + \phi$ in place of ϕ. We should thus have

$$y = -b \cos \delta \sin \phi + b \sin \delta \cos \phi,$$

and $ab \sin \delta$ represents the product of the coefficients of the parts which are now in the same phase, or (which is the same) the product of the coefficients of the x vibration and of that part of the y vibration which was 90° behind in phase. In general, if

$$x = h \cos \phi + h' \sin \phi, \qquad y = k \cos \phi + k' \sin \phi \quad . \quad (12),$$

the first product is $hk + h'k'$ and the second is $hk' - h'k$.

Let us next examine how the quantities which we have been considering are affected by a transformation of coordinates in accordance with the formulæ

$$x' = x \cos \omega + y \sin \omega, \qquad y' = x \sin \omega + y \cos \omega \quad . \quad . \quad (13).$$

We find

$$x' = \cos \phi \left\{ a \cos \omega + b \sin \omega \cos \delta \right\} + \sin \phi \,.\, b \sin \delta \sin \omega \,. \quad (14),$$

$$y' = \cos \phi \left\{ -a \sin \omega + b \cos \omega \cos \delta \right\} + \sin \phi \,.\, b \sin \delta \cos \omega \,. \quad (15);$$

whence

$$\text{amp.}^2 \text{ of } x' = a^2 \cos^2 \omega + b^2 \sin^2 \omega + 2ab \cos \delta \sin \omega \cos \omega \,. \quad (16),$$

$$\text{amp.}^2 \text{ of } y' = a^2 \sin^2 \omega + b^2 \cos^2 \omega - 2ab \cos \delta \sin \omega \cos \omega \,. \quad (17).$$

In like manner

$$\text{First prod.} = (b^2 - a^2) \sin \omega \cos \omega + ab \cos \delta (\cos^2 \omega - \sin^2 \omega) \,. \quad (18),$$

$$\text{Second product} = ab \sin \delta \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (19).$$

The second product, representing the circulating part of the motion, is thus unaltered by the transformation.

Let us pass on to the consideration of the mean quantities which occur in (9), (10), writing for brevity

$$M(a^2) = A, \quad M(b^2) = B, \quad M(ab \cos \delta) = C, \quad M(ab \sin \delta) = D.$$

From (16), (17), (18), (19), if A′, B′, C′, D′ denote the corresponding quantities after transformation,

$$A' = A \cos^2 \omega + B \sin^2 \omega + 2C \cos \omega \sin \omega \quad . \quad . \quad . \quad (20),$$

$$B' = A \sin^2 \omega + B \cos^2 \omega - 2C \cos \omega \sin \omega \quad . \quad . \quad . \quad (21),$$

$$C' = C (\cos^2 \omega - \sin^2 \omega) + (B - A) \cos \omega \sin \omega \quad . \quad . \quad (22),$$

$$D' = D \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (23).$$

These formulæ prove that, if the conditions (9), (10), shown to be necessary in order that the light may behave as natural light, be satisfied for one set of axes, they are equally satisfied with any other. It is thus a matter of indifference with respect to what axes the retardation ϵ is supposed to be introduced, and the conditions (9), (10) are sufficient, as well as necessary, to characterize natural light.

Reverting to (8), we see that, whether the light be natural or not, its character, so far as experimental tests can show, is determined by the values of A, B, C, D. The effect of a change of axes is given by (20), etc., and it is evident that the new axes may always be so chosen that $C' = 0$. For this purpose it is only necessary to take ω such that

$$\tan 2\omega = 2C/(A - B).$$

If we choose these new axes as fundamental axes, the values of the constants for any others inclined to them at angle ω will be of the form

$$\left. \begin{aligned} A &= A_1 \cos^2 \omega + B_1 \sin^2 \omega \\ B &= A_1 \sin^2 \omega + B_1 \cos^2 \omega \\ C &= (B_1 - A_1) \cos \omega \sin \omega \end{aligned} \right\} \quad . \quad . \quad . \quad . \quad . \quad . \quad (24).$$

If A_1 and B_1 are here equal, then $C = 0$, $A = B$ for all values of ω. In this case, the light cannot be distinguished from natural light by mere resolution; but if D be finite, the difference may be made apparent with the aid of a retarding plate.

If A_1 and B_1 are unequal, they represent the maximum and minimum values of A and B. The intensity is then a function of the plane of resolution, and the light may be recognized as partially polarized by the usual tests. If either A_1 or B_1 vanishes, the light is plane-polarized.[2]

When several independent streams of light are combined, the values, not only of A and B, but also of C and D, for the mixture, are to be found by simple addition. It must here be distinctly understood that there are no permanent phase-relations between one component and another. Suppose, for example, that there are two streams of light, each of which satisfies the relations $A = B$, $C = 0$, but makes the value of D finite. If the two values of D are equal and opposite, and the streams are independent, the mixture constitutes natural light. A particular case arises when each component is circularly-polarized ($D = \pm A = \pm B$), one in the right-handed and the other in the left-handed direction. The intensities being equal, the mixture is equivalent to natural light, but only under the restriction that the streams are without phase-relation. If, on the contrary, the second stream be similar to the first, affected merely with a constant retardation, the resultant is not natural, but completely (plane) polarized light.

Analysis of general case.

We will now prove that the most general mixture of light may be regarded as compounded of one stream of light elliptically-polarized in a definite manner, and of an independent stream of natural light. The theorem is due to Stokes,[3] but the method that we shall follow is that of Verdet.[4]

In the first place, it is necessary to observe that the values of the fundamental quantities A, B, C, D are not free from restriction. It will be shown that in no case can $C^2 + D^2$ exceed AB.

In equations (2), expressing the vibration at any moment, let a_1, b_1, α_1, β_1, be the values of a, b, α, β during an interval of time proportional to m_1, and in like manner let the suffixes 2, 3, ... correspond to times proportional to m_2, m_3, ... Then

$$AB = m_1^2 a_1^2 b_1^2 + m_2^2 a_2^2 b_2^2 + \ldots + m_1 m_2 (a_1^2 b_2^2 + a_2^2 b_1^2) + \,.\,.$$

Again, by (12),

$$\begin{aligned} C &= m_1 a_1 b_1 (\cos \alpha_1 \cos \beta_1 + \sin \alpha_1 \sin \beta_1) + \ldots \\ &= m_1 a_1 b_1 \cos \delta_1 + m_2 a_2 b_2 \cos \delta_2 + \ldots, \\ D &= m_1 a_1 b_1 \sin \delta_1 + m_2 a_2 b_2 \sin \delta_2 + \ldots; \end{aligned}$$

where, as before,

$$\delta_1 = \beta_1 - \alpha, \quad \delta_2 = \beta_2 - \alpha_2, \quad \ldots .$$

Thus,

$$C^2 + D^2 = m_1^2 a_1^2 b_1^2 + m_2^2 a_2^2 b_2^2 + \ldots + m_1 m_2 a_1 b_1 a_2 b_2 \cos (\delta_2 - \delta_1) + \,.\,.$$

From these equations we see that $AB - C^2 - D^2$ reduces itself to a sum of terms of the form

$$m_1 m_2 [a_1^2 b_2^2 + a_2^2 b_1^2 - 2 a_1 b_1 a_2 b_2 \cos (\delta_2 - \delta_1)],$$

each of which is essentially positive.

The only case in which the sum can vanish is when

$$\delta_1 = \delta_2 = \delta_3 = \ldots,$$

and further $\quad b_1 : a_1 = b_2 : a_2 = b_3 : a_3 = \ldots$

Under these conditions the light is reduced to be of a definite elliptic character, although the amplitude and phase of the system *as a whole* may be subject to rapid variation. The elliptic constants are given by

$$b^2/a^2 = B/A, \qquad \tan \delta = D/C \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (25).$$

In general AB exceeds $(C^2 + D^2)$; but it will always be possible to find a positive quantity H, which when subtracted from A and B (themselves necessarily positive) shall reduce the product to equality with $C^2 + D^2$, in accordance with

$$(A - H)(B - H) = C^2 + D^2 \quad . \quad . \quad . \quad . \quad . \quad . \quad (26).$$

The original light may thus be resolved into two groups. For the first group the constants are H, H, 0, 0; and for the second $A - H$, $B - H$, C, D. Each of these is of a simple character; for the first represents natural light, and the second light elliptically polarized. It is thus proved that in general a stream of light may be regarded as composed of one stream of natural light and of another elliptically-polarized. The intensity of the natural light is 2H, where from (26)

Stokes's theorem.

$$H = \tfrac{1}{2}(A + B) - \tfrac{1}{2}\sqrt{\left\{ (A - B)^2 + 4(C^2 + D^2) \right\}} \quad . \quad (27).$$

The elliptic constants of the second component are given by

$$b^2/a^2 = (B - H)/(A - H), \qquad \tan \delta = D/C \quad . \quad . \quad (28),$$

and

$$M(a^2) = A - H \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (29).$$

If $D = 0$, and therefore by (28) $\delta = 0$, the second component is plane-polarized. This is regarded as a particular case of elliptic polarization. Again, if $A = B$, $C = 0$, the polarization is circular.

The laws of interference of polarized light, discovered by Fresnel and Arago, are exactly what the theory of transverse vibrations would lead us to expect, when once we have cleared up the idea of unpolarized light. Ordinary sources, such as the sun, emit unpolarized light. If this be resolved in two opposite directions, the polarized components are not only each irregular, but there is no permanent phase-relation between them. No light derived from one can therefore ever interfere regularly with light derived from the other. If, however, we commence with plane-polarized light, we have only one series of irregularities to deal with. When resolved in two rectangular directions, the components cannot then interfere, but only on account of the perpendicularity. If brought back by resolution to the same plane of polarization, interference becomes possible, because the same series of irregularities are to be found in both components.

§ 21. *Double Refraction.*

The construction by which Huygens explained the ordinary and extraordinary refraction of Iceland spar has already been given (LIGHT, vol. xiv. pp. 614–15). The wave-surface is in two sheets, composed of a sphere and of an ellipsoid of revolution, in contact with one another at the extremities of the polar axis. In biaxal crystals the wave-surface is of a more complicated character, including that of Huygens as a particular case.

Wave-surface.

It is not unimportant to remark that the essential problem of double refraction is to determine the two velocities with which plane waves are propagated, when the direction of the normal to the wave-front is assigned. When this problem has been solved, the determination of the wave-surface is a mere matter of geometry, not absolutely necessary for the explanation of the leading phenomena, but convenient as affording a concise summary of the principal laws. In all cases the wave-surface is to be regarded as the envelope at any subsequent time of all the plane wave-fronts which at a given instant may be supposed to be passing through a particular point.

Direction of ray.

In singly refracting media, where the velocity of a wave is the same in all directions, the wave-normal coincides with the *ray*. In double refracting crystals this law no longer holds good. The principles by which the conception of a ray is justified (§ 10), when applied to this case, show that the centre of the zone system is not in general to be found at the foot of the perpendicular upon the primary wave-front. The surface whose contact with the primary wave-front determines the element from which the secondary disturbance arrives with least retardation is now not a sphere, but whatever wave-surface is appropriate to the medium. The direction of the ray, corresponding to any tangent plane of the wave-surface, is thus not the normal, but the radius vector drawn from the centre to the point of contact.

The velocity of propagation (reckoned always perpendicularly to the wave-front) may be conceived to depend upon the direction of the wave-front, or wave-normal, and upon what we may call (at any rate figuratively) the direction of vibration. If the velocity depended exclusively upon the wave-normal, there could be no *double*, though there might be *extraordinary*, refraction, *i.e.*, refraction deviating from the law of Snell; but of this nothing is known in nature. The fact that there are in general two velocities for one wave-front proves that the velocity depends upon the direction of vibration.

Fresnel's views.

According to the Huygenian law, confirmed to a high degree of accuracy by the observations of Brewster and Swan,[1] a ray polarized in a principal plane (*i.e.*, a plane passing through the axis) of a uniaxal crystal suffers ordinary refraction only, that is, propagates itself with the same velocity in all directions. The interpretation which Fresnel put upon this is that the vibrations (understood now in a literal sense) are perpendicular to the plane of polarization, and that the velocity is constant because the direction of vibration is in all cases similarly related (perpendicular) to the axis. The development of this idea in the fertile brain of Fresnel led him to the remarkable discovery of the law of refraction in biaxal crystals.

The hypotheses upon which Fresnel based his attempt at a mechanical theory are thus summarized by Verdet:

(1) The vibrations of polarized light are perpendicular to the plane of polarization;

(2) The elastic forces called into play during the propagation of a system of plane waves (of rectilinear transverse vibrations) differ from the elastic forces developed by the parallel displacement of a single molecule only by a constant factor, independent of the particular direction of the plane of the wave;

(3) When a plane wave propagates itself in any homogeneous medium, the components parallel to the wave-front of the elastic forces called into play by the vibrations of the wave are alone operative;

(4) The velocity of a plane wave which propagates itself with type unchanged in any homogeneous medium is proportional to the square root of the effective component of the elastic force developed by the vibrations.

Fresnel himself was perfectly aware that his theory was deficient in rigor and indeed there is little to be said in defence of his second hypothesis. Nevertheless, the great historical interest of this theory, and the support that experiment gives to Fresnel's conclusion as to the actual form of the wave-surface in biaxal crystals, render some account of his work in this field imperative.

Energy of displacement.

The potential energy of displacement of a single molecule from its position of equilibrium is ultimately a quadratic function of the three components reckoned parallel to any set of rectangular axes. These axes may be so chosen as to reduce the quadratic function to a sum of squares, so that the energy may be expressed,

$$V = \tfrac{1}{2}a^2\xi^2 + \tfrac{1}{2}b^2\eta^2 + \tfrac{1}{2}c^2\zeta^2 \quad . \quad . \quad . \quad . \quad . \quad (1),$$

where ξ, η, ζ are the three component displacements. The corresponding forces of restitution, obtained at once by differentiation, are

$$X = a^2\xi, \qquad Y = b^2\eta, \qquad Z = c^2\zeta \quad . \quad . \quad . \quad (2).$$

The force of restitution is thus in general inclined to the direction of displacement. The relation between the two directions X, Y, Z and ξ, η, ζ is the same as that between the normal to a tangent plane and the radius vector ρ to the point of contact in the ellipsoid

$$a^2\xi^2 + b^2\eta^2 + c^2\zeta^2 = 1 \quad . \quad . \quad . \quad . \quad . \quad (3).$$

If a^2, b^2, c^2 are unequal, the directions of the co-ordinate axes are the only ones in which a displacement calls into operation a parallel force of restitution. If two of the quantities a^2, b^2, c^2 are equal, the ellipsoid (3) is of revolution, and every direction in the plane of the equal axes possesses the property in question. This is the case of a uniaxal crystal. If the three quantities a^2, b^2, c^2 are all equal, the medium is isotropic.

If we resolve the force of restitution in the direction of displacement, we obtain a quantity dependent upon this direction in a manner readily expressible by means of the ellipsoid of elasticity (3). For, when the total displacement is given, this quantity is proportional to

$$\frac{a^2\xi^2 + b^2\eta^2 + c^2\zeta^2}{\xi^2 + \eta^2 + \zeta^2},$$

that is to say, to the inverse square of the radius vector ρ in (3).

Directions of vibration.

We have now to inquire in what directions, limited to a particular plane, a displacement may be so made that the *projection* of the force of restitution upon the plane may be parallel to the displacement. The answer follows at once from the property of the ellipsoid of elasticity. For, if in any section of the ellipsoid we have a radius vector such that the plane containing it and the normal to the corresponding tangent plane is perpendicular to the plane of the section, the tangent line to the section must be perpendicular to the radius vector, that is, the radius vector must be a principal axis of the section. There are therefore two, and in general only two, directions in any plane satisfying the proposed condition, and these are perpendicular to one another. If, however, the plane be one of those of circular section, every line of displacement is such that the component of the force, resolved parallel to the plane coincides with it.

According to the principles laid down by Fresnel, we have now complete data for the solution of the problem of double refraction. If the direction of the wave-front be given, there are (in general) only two directions of vibration such that a single wave is propagated. If the actual displacements do not conform to this condition, they will be resolved into two of the required character, and the components will in general be propagated with different velocities. The two directions are the principal axes of the section of (3) made by the wave-front, and the velocities of propagation are inversely proportional to the lengths of these axes.

The law connecting the lengths of the axes with the direction (l, m, n) of the plane is a question of geometry;[2] and indeed the whole investigation of the wave-surface may be elegantly carried through geometrically with the aid of certain theorems of MacCullagh respecting *apsidal* surfaces (Salmon, ch. xiv.). For this, however, we have not space, and must content ourselves with a sketch of the analytical method of treatment.

If v be the velocity of propagation in direction l, m, n, the wave-surface is the envelope of planes

$$lx + my + nz = v \quad . \quad . \quad . \quad . \quad . \quad . \quad (4),$$

where v is a function of l, m, n, whose form is to be determined. If (λ, μ, ν) be the corresponding direction of vibration, then

---

[1] *Edinb. Trans.*, vol. xvi. p. 375.

[2] See Salmon's *Analytical Geometry of Three Dimensions*, Dublin, 1882, § 102.

$$l\lambda + m\mu + n\nu = 0 \quad . \quad . \quad . \quad . \quad . \quad . \quad (5).$$

According to the principles laid down by Fresnel, we see at once that the force of restitution $(a^2\lambda, b^2\mu, c^2\nu)$, corresponding to a displacement unity, is equivalent to a force v^2 along (λ, μ, ν), together with some force (P) along (l, m, n). Revolving parallel to the coordinate axes, we get

$$l\mathrm{P} = a^2\lambda - v^2\lambda\,, \qquad m\mathrm{P} = b^2\mu - v^2\mu\,. \qquad n\mathrm{P} = c^2\nu - v^2\nu\,,$$

or

$$\lambda = \frac{l\mathrm{P}}{a^2 - v^2}\,, \qquad \mu = \frac{m\mathrm{P}}{b^2 - v^2}\,, \qquad \nu = \frac{n\mathrm{P}}{c^2 - v^2} \quad . \quad . \quad . \quad (6).$$

Law of velocity.

Multiplying these by l, m, n respectively, and taking account of (5), we see that

$$\frac{l^2}{a^2 - v^2} + \frac{m^2}{b^2 - v^2} + \frac{n^2}{c^2 - v^2} = 0 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (7)$$

is the relation sought for between v and (l, m, n). In this equation b, c are the velocities when the direction of propagation is along x, the former being applicable when the vibration is parallel to y, and the latter when it is parallel to x.

The directions of vibration are determined by (5) and by the consideration that (l, m, n), (λ, μ, ν), and $(a^2\lambda, b^2\mu, c^2\nu)$ lie in a plane, or (as we may put it) are all perpendicular to one direction (f, g, h).

Thus

$$\left.\begin{aligned} lf + mg + nh &= 0 \\ \lambda f + \mu g + \nu h &= 0 \\ a^2\lambda f + b^2\mu g + c^2\nu h &= 0 \end{aligned}\right\} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (8).$$

The determinant expressing the result of the elimination of $f : g : h$ may be put into the form

$$\frac{l}{\lambda}(b^2 - c^2) + \frac{m}{\mu}(c^2 - a^2) + \frac{n}{\nu}(a^2 - b^2) = 0 \quad . \quad . \quad . \quad (9),$$

which with (5) suffices to determine (λ, μ, ν) as a function of (l, m, n).

The fact that the system of equations (5), (8) is symmetrical as between (λ, μ, ν) and (f, g, h) proves that the two directions of vibration corresponding to a given (l, m, n) are perpendicular to one another.

A. Smith's investigation.

The direct investigation of the wave-surface from (4) and (7) was first effected by Ampère, but his analytical process was very laborious. Fresnel had indeed been forced to content himself with an indirect method of verification. But in the following investigation of A. Smith[1] the eliminations are effected with comparatively little trouble.

In addition to (4) and (7), we know that

$$l^2 + m^2 + n^2 = 1\,. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (10).$$

To find the equation to the envelope, we have to differentiate these equations, making l, m, n, v vary. Eliminating the differentials by the method of multipliers, we obtain the following:

$$x = \mathrm{A}l + \mathrm{B}l/(v^2 - a^2)\,. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (11),$$

$$y = \mathrm{A}m + \mathrm{B}m/(v^2 - b^2) \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (12),$$

$$z = \mathrm{A}n + \mathrm{B}n/(v^2 - c^2)\,. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (13);$$

and

$$1 = \mathrm{B}v\left\{\frac{l^2}{(v^2 - a^2)^2} + \frac{m^2}{(v^2 - b^2)^2} + \frac{n^2}{(v^2 - c^2)^2}\right\}. \quad . \quad . \quad (14).$$

The equations (11), (12), (13) multiplied by l, m, n respectively and added, give

$$v = \mathrm{A}\,. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (15).$$

The same equations, squared and added, give

$$x^2 + y^2 + z^2 = \mathrm{A}^2 + \mathrm{B}/v.$$

If we put r^2 for $x^2 + y^2 + z^2$, and for A the value just found, we obtain

$$\mathrm{B} = v(r^2 - v^2)\,. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (16).$$

If these values of A and B be substituted in (11),

$$x = lv\left\{1 + \frac{r^2 - v^2}{v^2 - a^2}\right\} = lv\,\frac{r^2 - a^2}{v^2 - g^2}\,,$$

or

$$l = \frac{v^2 - a^2}{r^2 - a^2}\,\frac{x}{v} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (17).$$

If we substitute this value of l, and the corresponding values of m, n in (4), we get

$$\frac{(v^2 - a^2)x^2}{r^2 - a^2} + \frac{(v^2 - b^2)y^2}{r^2 - b^2} + \frac{(v^2 - c^2)z^2}{r^2 - c^2} = v^2 = \frac{v^2x^2}{r^2} + \frac{v^2y^2}{r^2} + \frac{v^2z^2}{r^2}\,,$$

whence

Fresnel's wave-surface.

$$\frac{x^2a^2}{r^2 - a^2} + \frac{y^2b^2}{r^2 - b^2} + \frac{z^2c^2}{r^2 - c^2} = 0\,. \quad . \quad . \quad . \quad . \quad . \quad . \quad (18),$$

as the equation of the wave-surface.

By (6) equation (11) may be written

$$x = \mathrm{A}l + \mathrm{BP}^{-1}\lambda\,,$$

from which and the corresponding equations we see that the direction (x, y, z) lies in the same plane as (l, m, n) and (λ, μ, ν). Hence in any tangent plane of the wave-surface the direction of vibration is that of the line joining the foot of the perpendicular and the point of contact (x, y, z).

The equation (18) leads to another geometrical definition of Fresnel's wave-surface. If through the centre of the ellipsoid reciprocal to the ellipsoid of elasticity (3), viz.,

$$x^2/a^2 + y^2/b^2 + z^2/c^2 = 1 \quad . \quad . \quad . \quad . \quad (19),$$

a plane be drawn, and on the normal to this plane two lengths be marked off proportional to the axes of the elliptic section determined by the plane, the locus of the points thus obtained, the apsidal surface of (19), is the wave-surface (18).

Fully developed in integral powers of the co-ordinates, (18) takes the form

$$\begin{aligned}(x^2 + y^2 + z^2)(a^2x^2 + b^2y^2 + c^2z^2) - a^2(b^2 + c^2)x^2 \\ - b^2(c^2 + a^2)y^2 - c^2(a^2 + b^2)z^2 + a^2b^2c^2 = 0 \quad . \quad . \quad (20).\end{aligned}$$

Principal sections.

The section of (20) by the coordinate plane $y = 0$ is

$$(x^2 + z^2 - b^2)(a^2x^2 + c^2z^2 - a^2c^2) = 0 \ldots (21),$$

representing a circle and an ellipse (Fig. 24). That the sections by each of the principal planes would be a circle and an ellipse might have been foreseen independently of a general solution of the envelope problem. The forms of the sections prescribed in (21) and the two similar equations are sufficient to determine the character of the wave-surface, if we assume that it is of the *fourth degree*, and involves only the even powers of the co-ordinates. It was somewhat in this way that the question was first obtained by Fresnel.

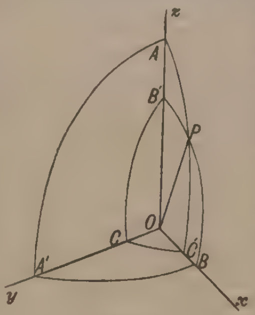

FIG. 24.

Uniaxal crystals.

If two of the principal velocities *e.g.*, a and b, are equal, (20) becomes

$$(x^2 + y^2 + z^2 - a^2)(a^2x^2 + a^2y^2 + c^2z^2 - a^2c^2) = 0 \quad . \quad (22),$$

so that the wave-surface degenerates into the Huygenian sphere and ellipsoid of revolution appropriate to a uniaxal crystal. The two sheets touch one another at the points $x = 0$, $y = 0$, $z = \pm a$. If $c > a$, as in Iceland spar, the ellipsoid is external to the sphere. On the other hand, if $c < a$, as in quartz, the ellipsoid is internal.

We have seen that when the wave-front is parallel to the circular sections of (3), the two wave velocities coincide. Thus in (7), if a^2, b^2, c^2 be in descending order of magnitude, we have $m = 0$, $v = b$; so that

$$\frac{l^2}{a^2 - b^2} = \frac{n^2}{b^2 - c^2} = \frac{1}{a^2 - c^2} \quad . \quad . \quad . \quad . \quad . \quad (23).$$

Optic axes.

In general, if θ, θ' be the angles which the normal to the actual wave-front makes with the optic axes, it may be proved that the difference of the squares of the two roots of (7) is given by

$$v_2^2 - v_1^2 = (a^2 - c^2)\sin\theta\sin\theta'\,. \quad . \quad . \quad . \quad (24).$$

In a uniaxal crystal the optic axes coincide with the axis of symmetry, and there is no distinction between θ' and θ.

Since waves in a biaxal crystal propagated along either optic axis have but one velocity, it follows that tangent planes to the wave-surface, perpendicular to these directions, touch both sheets of the surface. It may be proved further that each plane touches the surface not merely at two, but at an infinite number of points, which lie upon a circle.

The direction of the optic axes, and the angle included between them, are found frequently to vary with the color of the light. Such a variation is to be expected, in view of dispersion, which renders a^2, b^2, c^2 functions of the wave-length.

Huygens's construction.

A knowledge of the form of the wave-surface determines in all cases the law of refraction according to the construction of Huygens. We will suppose for simplicity that the first medium is air, and that the surface of separation between the media is plane. The incident wave-front at any moment of time cuts the surface of separation in a straight line. On this line take any point, and with it as centre construct the wave-surface in the second medium corresponding to a certain interval of time. At the end of this interval the trace of the incident wave-front upon the surface will have advanced to a new position, parallel to the former. Planes drawn through this line so as to touch the wave-surface give the positions of the refracted wave-fronts. None other could satisfy the two conditions—(1) that the refracted wave-front should move within the crystal with the normal velocity suitable to its direction, and (2) that the traces of the incident and refracted waves upon the surface of separation should move together. The normal to a refracted wave lies necessarily in the plane of incidence, but the refracted *ray*, coinciding with the radius vector of the wave-surface, in general deviates from it. In most cases it is sufficient to attend to the wave normal.

---

[1] *Camb. Trans.*, vi., 1835.

Total reflection.

As in total reflection by simply refracting media, it may happen that no tangent planes can be drawn to satisfy the prescribed conditions, or that but one such can be drawn.

When the crystal is uniaxal, one wave is refracted according to the ordinary law of Snell. The accuracy of both the sphere and the ellipsoid of the Huygenian construction has been fully verified by modern observations.[1]

The simplest case of uniaxal refraction is when the axis of the crystal is perpendicular to the plane of incidence, with respect to which every thing then becomes symmetrical. The section of the wave-surface with which we have to deal reduces to two concentric circles; so that *both* waves are refracted according to the ordinary law, though of course with different indices.

In biaxal crystals one wave follows the ordinary law of refraction, if the plane of incidence coincide with a principal plane of the crystal. This consequence of his theory was verified by Fresnel himself, and subsequently by Rudberg and others. But the most remarkable phenomena of biaxal refraction are undoubtedly those discovered by Hamilton and Lloyd, generally known as conical refraction.

Conical refraction.

In general there are two refracted rays, corresponding to two distinct waves. But the refracted waves coalesce when they are perpendicular to either optic axis, and (as we have seen) this wave touches the wave-surface along a circle. Thus corresponding to one wave direction there are an infinite number of rays, lying upon a cone. The division of a single incident ray into a cone of refracted rays is called internal conical refraction. If the second face of the crystal is parallel to the first, each refracted ray resumes on emergence its original direction, so that the emergent bundle forms a hollow cylinder.

External conical refraction depends upon the singular points in the principal plane of *zx*, where the two sheets of the surface cross one another (Fig. 24). At such a point (P) an infinite number of tangent planes may be drawn to the surface, and each of the perpendiculars from O represents a wave direction, corresponding to the single *ray* OP. On emergence these waves will be differently refracted; and thus corresponding to a single internal ray there are an infinite number of external rays, lying upon a cone.

It has already been admitted that the dynamical foundations of Fresnel's theory are unsound; and it must be added that the rigorous theory of crystalline solids investigated by Cauchy and Green does not readily lend itself to the explanation of Fresnel's laws of double refraction. On this subject the reader should consult Prof. Stokes's Report. Sir W. Thomson has recently shown[2] that an originally isotropic medium, pressed unequally in different directions, may be so constituted as to vibrate in accordance with Fresnel's laws.

It may perhaps be worth while to remark that the equations, analogous to (2) § (24), which lead to these laws are

$$\frac{d^2\xi}{dt^2} = \frac{dp}{dx} + a^2\nabla^2\xi\,, \qquad \frac{d^2\eta}{dt^2} = \frac{dp}{dy} + b^2\nabla^2\eta\,, \text{ etc.} \quad . \quad . \quad . \quad (25);$$

where *a*, *b*, *c* are the principal wave velocities. If we here assume

$$\xi = \lambda\theta\,, \quad \eta = \mu\theta\,, \quad \zeta = \nu\theta\,,$$
$$\theta/\theta_0 = p/p_0 = \epsilon^{ik(lx+my+nz-Vt)},$$

and substitute in (25), the condition of transversality leads at once to the desired results. But the equations (25) are not applicable to the vibrations of a crystalline solid.

Electro-magnetic theory.

In the electro-magnetic theory double refraction is attributed to æolotropic inductive capacity, and appears to offer no particular difficulty.

If the present position of the theory of double refraction is still somewhat unsatisfactory, it must be remembered that the uncertainty does not affect the general principle. Almost any form of wave theory involving transverse vibrations will explain the leading phenomenon, viz., the bifurcation of the ray. It is safe to predict that when ordinary refraction is well understood there will be little further trouble over double refraction.

Double absorption.

The wave-velocity is not the only property of light rendered unsymmetrical by crystalline structure. In many cases the two polarized rays are subject to a different rate of *absorption*. Tourmalines and other crystals may be prepared in plates of such thickness that one ray is sensibly stopped and the other sensibly transmitted, and will then serve as polarizing (or analyzing) apparatus. Although for practical purposes Nicol's prisms (LIGHT, vol. xiv. p. 617) are usually to be preferred, the phenomenon of double absorption is of great theoretical interest. The explanation is doubtless closely connected with that of double refraction.

§ 22. *Colors of Crystalline Plates.*

When polarized light is transmitted through a moderately thin plate of doubly refracting crystal, and is then analyzed, *e.g.*, with a Nicol, brilliant colors are often exhibited, analogous in their character to the tints of Newton's scale. With his usual acuteness, Young at once attributed these colors to interference between the ordinary and extraordinary waves, and showed that the thickness of crystal required to develop a given tint, inversely proportional to the doubly refracting power, was in agreement with this view. But the complete explanation, demanding a fuller knowledge of the laws of interference of polarized light, was reserved for Fresnel and Arago. The subject is one which admits of great development;[3] but the interest turns principally upon the beauty of the effects, and upon the facility with which many of them may be obtained in experiment. We must limit ourselves to a brief treatment of one or two of the simpler cases.

The incident vibration being plane polarized, we will suppose that its plane makes an angle α with the principal plane of the crystal. On entering the crystal it is accordingly resolved into the two components represented by

$$\cos\alpha\cos\phi, \qquad \sin\alpha\cos\phi, \qquad \text{where } \phi = 2\pi t/\tau.$$

In traversing the crystal both waves are retarded, but we are concerned only with the difference of the retardations. Denoting the difference by ρ, we may take as the expressions of the waves on emergence

$$\cos\alpha\cos\phi, \qquad \sin\alpha\cos(\phi-\rho).$$

It may be remarked that, in the absence of *dispersion*, ρ would be inversely proportional to λ; but in fact there are many cases where it deviates greatly from this law.

Now let the plane of analyzation be inclined at the angle β to that of primitive polarization (Fig. 25). Then for the sum of the two resolved components we have

$$\cos\alpha\cos(\alpha-\beta)\cos\phi + \sin\alpha\sin(\alpha-\beta)\cos(\phi-\rho)\,,$$

of which the intensity is

$$\{\cos\alpha\cos(\alpha-\beta) + \sin\alpha\sin(\alpha-\beta)\cos\rho\}^2 + \sin^2\alpha\sin^2(\alpha-\beta)$$
$$\sin^2\beta = \cos^2\beta - \sin 2\alpha\sin 2(\alpha-\beta)\sin^2\tfrac{1}{2}\rho \quad . \quad . \quad . \quad . \quad (1).$$

If in (1) we write $\beta + \frac{1}{2}\pi$ in place of β, we get

$$\sin^2\beta + \sin 2\alpha\sin 2(\alpha-\beta)\sin^2\tfrac{1}{2}\rho \quad . \quad . \quad . \quad . \quad (2);$$

and we notice that the sum of (1) and (2) is unity under all circumstances. The effect of rotating the analyzer through 90° is thus always to transform the tint into its complementary. The two complementary tints may be seen at the same time if we employ a double image prism. In the absence of an analyzer we may regard the two images as superposed, and there is no color.

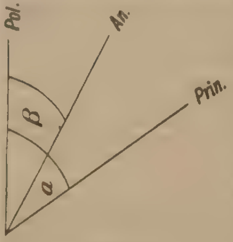

FIG. 25.

Colors of mica and selenite.

These expressions may be applied at once to the explanation of the colors of thin plates of mica or selenite. In this case the retardation ρ is proportional to the thickness, and approximately independent of the precise direction of the light, supposed to be nearly perpendicular to the plate, viz., nearly parallel to a principal axis of the crystal.

The most important cases are when $\beta = 0$, $\beta = \frac{1}{2}\pi$. In the latter the field would be dark were the plate removed; and the actual intensity is

$$\sin^2 2\alpha\sin^2\tfrac{1}{2}\rho \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (3).$$

The composition of the light is thus independent of the azimuth of the plate (α); but the *intensity* varies greatly, vanishing four times during the complete revolution. The greatest brightness occurs when the principal plane bisects the angle between the planes of polarization and analysis. If $\beta = 0$, the light is complementary to that represented by (3).

[3] See Verdet's *Leçons*, vol. ii.

If two plates be superposed the retardations are added if the azimuths correspond; but they are subtracted if one plate be rotated relatively to the other through 90°. It is thus possible to obtain color by the superposition of two nearly similar plates, although they may be too thick to answer the purpose separately.

If dispersion be neglected, the law of the colors in (3) is the same as that of the reflected tints of Newton's scale. The thicknesses of the plates of mica (acting by double refraction) and of air required to give the same color are as 400 : 1. When a plate is too thick to show color, its action may be analyzed with the aid of a spectroscope.

Rings from uniaxal crystals.

Still thicker plates may be caused to exhibit color, if the direction of the light within them makes but a small angle with an optic axis. Let us suppose that a plate of Iceland spar, or other uniaxal crystal (except quartz), cut perpendicularly to the axis, is interposed between the polarizing and analyzing apparatus, and that the latter is so turned that the field is originally dark. The ray which passes perpendicularly is not doubly refracted, so that the centre of the field remains dark. At small angles to the optic axis the relative retardation is evidently proportional to the square of the inclination, so that the colors are disposed in concentric rings. But the intensity is not the same at the various parts of the circumference. In the plane of polarization and in the perpendicular plane there is no double refraction, or rather one of the refracted rays vanishes. Along the corresponding lines in the field of view there is no revival of light, and the ring system is seen to be traversed by a black cross.

In many crystals the influence of dispersion is sufficient to sensibly modify the proportionality of ρ to λ. In one variety of uniaxal apophylite Herschel found the rings nearly achromatic, indicating that ρ was almost independent of λ. Under these circumstances a much larger number of rings than usual became visible.

In biaxal crystals, cut so that the surfaces are equally inclined to the optic axes, the rings take the form of lemniscates.

Double refraction due to strain.

A medium originally isotropic may acquire the doubly refracting property under the influence of strain; and, if the strain be *homogeneous*, the conditions are optically identical with those found in a natural crystal. The principal axes of the wave-surface coincide with those of strain. If the strain be symmetrical, the medium is optically uniaxal. In general, if P, Q, R be the principal stresses, the difference of velocities for waves propagated parallel to R is evidently proportional to (P–Q), and so on.

More often it happens that the strain is not homogeneous. Even then the small parts may be compared to crystals, but the optical constants vary from point to point. The comparatively feeble doubly refracting power thus developed in glass may best be made evident by the production of the colors of polarized light. Thus, in an experiment due to Brewster, a somewhat stout slab of glass, polished on the edges, is interposed between crossed Nicols. When the slab is bent in a plane perpendicular to that of vision, a revival of light takes place along the edges, where the elongation and contraction is greatest. If the width (in the direction of vision) be sufficient, the effect may be increased until the various colors of Newton's scale are seen. These colors vary from point to point of the thickness in the plane of bending, the "neutral axis" remaining dark. The optic axis, being everywhere coincident with the direction of elongation (or contraction), is parallel to the length of the slab. To this direction the plane of polarization should be inclined at about 45°.

Effects of heat.

The condition of internal strain is not necessarily due to forces applied from without. Thus, if glass originally free from strain be unequally heated, the accompanying expansions give rise to internal strains which manifest themselves in polarized light. If the heating be moderate, so as not to approach the softening point, the state of ease is recovered upon cooling, and the double refraction disappears. But if the local temperature be raised further, the hot parts may relieve themselves of the temporary strain, and then upon cooling they and other parts may be left in a condition of permanent strain. Sudden cooling of glass heated to the softening point leads to a similar result. The outer parts harden while the interior is still at a higher temperature, so that, when the whole is cooled down, the outside, being as it were too large for the inside, is in a condition of radial tension and circumferential compression. An examination in polarized light shows that the strains thus occasioned are often very severe. If any small part be relieved by fracture from the constraint exercised upon it by the remainder, the doubly refracting property almost or wholly disappears. In this respect unannealed glass differs essentially from a crystal, all parts of which are similar and independent. It may be remarked that it is difficult to find large pieces of glass so free from internal strain as to show no revival of light when examined between crossed Nicols.

§ 23. *Rotatory Polarization.*

Rotation by quartz.

In general a polarized ray travelling along the axis of a uniaxal crystal undergoes no change; but it was observed by Arago that, if quartz be used in this experiment, the plane of polarization is found to be rotated through an angle proportional to the thickness of crystal traversed. The subject was further studied by Biot, who ascertained that the rotation due to a given thickness is inversely as the square of the wave-length of the light, thus varying very rapidly with the color. In some specimens of quartz (called in consequence right-handed) the rotation is to the right, while in others it is to the left. Equal thicknesses of right- and left-handed quartz may thus compensate one another.

Fresnel has shown that the rotation of the plane may be interpreted as indicating a different velocity of propagation of the two circularly-polarized components into which plane-polarized light may always be resolved. In ordinary media the right- and left-handed circularly-polarized rays travel at the same speed, and at any stage of their progress recompound a ray rectilinearly-polarized in a fixed direction. But it is otherwise if the velocities of propagation of the circular components be even slightly different.

The first circularly-polarized wave may be expressed by

$$\xi_1 = r\cos(nt - k_1 z), \quad \eta_1 = r\sin(nt - k_1 z) \quad . \quad . \quad (1);$$

and the second (of equal amplitude) by

$$\xi_2 = r\cos(nt - k_2 z), \quad \eta_2 = -r\sin(nt - k_2 z) \quad . \quad . \quad (2).$$

The resultant of (1) and (2) is

$$\xi = \xi_1 + \xi_2 = 2r\cos\tfrac{1}{2}(k_2 - k_1)z\cos\left\{nt - \tfrac{1}{2}(k_1 + k_2)z\right\},$$
$$\eta = \eta_1 + \eta_2 = 2r\sin\tfrac{1}{2}(k_2 - k_1)z\cos\left\{nt - \tfrac{1}{2}(k_1 + k_1)z\right\};$$

so that

$$\eta/\xi = \tan\tfrac{1}{2}(k_2 - k_1)z \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (3),$$

which shows that for any fixed value of z the light is plane-polarized. The direction of this plane, however, varies with z. Thus, if $\eta/\xi = \tan\theta$, so that θ gives the angular position of the plane in reference to ξ, we have

$$\theta = \tfrac{1}{2}(k_2 - k_1)z \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4),$$

indicating a rotation proportional to z. The quantities k_1, k_2 are inversely as the wave-lengths of the two circular components for the same periodic time. When the relative retardation amounts to an entire period $(k_2 - k_1)z = 2\pi$, and then, by (4), $\theta = \pi$. The revolution of the plane through two right angles restores the original state of polarization. In quartz the rotation is very rapid, amounting in the case of yellow light to about 24° for each millimetre traversed.

Delicacy of test.

It is interesting to observe with what a high degree of accuracy the comparison of the velocities of the two waves can be effected. If the plane of polarization be determined to one minute of angle, a relative retardation of $\lambda/10800$ is made manifest. If l be the thickness traversed, v and $v + \delta v$ the two velocities, the relative retardation is $l\delta v/v$. To take an example, suppose that $l = 20$ inches, $\lambda = \frac{1}{40000}$ inch; so that if $\delta v/v$ exceed 10^{-8}, the fact might be detected.

In quartz the rotation of the plane depends upon the crystalline structure, but there are many liquids, *e.g.*, oil of turpentine and common syrup, which exhibit a like effect. In such cases the rotation is of course independent of the direction of the light; it must be due to some peculiarity in the constitution of the molecules.

Right- and left-handed varieties.

A remarkable connection has been observed between the rotatory property and the crystalline form. Thus Herschel found that in many specimens the right-handed and left-handed varieties of quartz could be distinguished by the disposition of certain subordinate faces. The crystals of opposite kinds are symmetrical in a certain sense, but are yet not *superposable.* The difference is like that between otherwise similar right- and left-handed screws. The researches of Pasteur upon the rotatory properties of tartaric acid have opened up a new and most interesting field of chemistry. At that time two isomeric varieties were known,—ordinary tartaric acid, which rotates to the right, and racemic acid, which is optically inactive, properties of the acids shared also by the salts. Pasteur found that the crystals of tartaric acid and of the tartrates possessed a right-handed structure, and endeavored to discover corresponding bodies with a left-handed structure. After many trials crystallizations of the double racemate of soda and ammonia were obtained, including crystals of opposite kinds. A selection of the right-handed specimens yielded ordinary dextro-tartaric acid, while a similar selection of the left-handed crystals gave a new variety—lævo-tartaric acid, rotating the plane of polarization to the left in the same degree as ordinary tartaric acid rotates it to the right. A mixture in equal proportions of the two kinds of tartaric acid, which differ scarcely at all in their chemical properties,[1] reconstitutes racemic acid.

Magnetic rotation.

The possibility of inducing the rotatory property in bodies otherwise free from it was one of the finest of Faraday's discoveries. He found that, if heavy glass, bisulphide of carbon, etc., are placed in a magnetic field, a ray of polarized light, propagated along the lines of magnetic force, suffers rotation. The laws of the phenomenon were carefully studied by Verdet, whose conclusions may be summed up by saying that in a given medium the rotation of the plane for a ray proceeding in any direction is proportional to the difference of magnetic potential at the initial and final points. In bisulphide of carbon, at 18° and for a difference of potential equal to unity C. G. S., the rotation of the plane of polarization of a ray of soda light is .0402 minute of angle.[2]

A very important distinction should be noted between the magnetic rotation and that natural to quartz, syrup, etc. In the latter the rotation is always right-handed or always left-handed with respect to the direction of the ray. Hence when the ray is reversed the absolute direction of rotation is reversed also. A ray which traverses a plate of quartz in one direction, and then after reflection traverses the same thickness again in the opposite direction, recovers its original plane of polarization. It is quite otherwise with the rotation under magnetic force. In this case the rotation is in the same absolute direction even though the ray be reversed. Hence, if a ray be reflected backwards and forwards any number of times along a line of magnetic force, the rotations due to the several passages are all accumulated. The non-reversibility of light in a magnetized medium proves the case to be of a very exceptional character, and (as was argued by Thomson) indicates that the magnetized medium is itself in rotatory motion independently of the propagation of light through it.[3]

Polarimetry.

The importance of polarimetric determinations has led to the contrivance of various forms of apparatus adapted to the special requirements of the case. If the light be bright enough, fairly accurate measurements may be made by merely rotating a Nicol until the field appears dark. Probably the best form of analyzer, when white light is used and the plane is the same for all the colored components, is the Jellet,[4] formed by the combination of two portions of Iceland spar. By this instrument the field of view is duplicated, and the setting is effected by turning it until the two portions of the field, much reduced in brightness, appear *equally* dark. A similar result is attained in the Laurent, which, however, is only applicable to homogeneous light. In this apparatus, advantage is taken of the action of a half-wave plate. In passing such a plate the plane of polarization is as it were *reflected* by the principal section, that is, rotated until it makes the same angle with the principal section as at first, but upon the further side. The plate covers only half of the field of view, and the eye is focused upon the dividing edge. The planes of polarization of the two halves of the field are different, unless the original plane be parallel (or perpendicular) to the principal section. In the Laurent analyzer the half-wave plate is rigidly combined with a Nicol in such a position that the principal section of the latter makes a small but finite angle with that of the plate. The consequence is that the two halves of the field of view cannot be blackened simultaneously, but are rendered equally dark when the instrument is so turned that the principal section of the plate is parallel to the plane of original polarization, which is also that of the uncovered half of the field. A slight rotation in either direction darkens one half of the field and brightens the other half.

Laurent analyzer.

In another form of "half-shade" polarimeter, invented by Poynting, the half-wave plate of the Laurent is dispensed with, a small rotation of one-half of the field with respect to the other half being obtained by quartz (cut perpendicularly to the axis) or by syrup. In the simplest construction the syrup is contained in a small cell with parallel glass sides, and the division into two parts is effected by the insertion of a small piece of plate glass about $\frac{3}{16}$ inch thick, a straight edge of which forms the dividing line. If the syrup be strong, the difference of thickness of $\frac{3}{16}$ inch gives a relative rotation of about 2°. In this arrangement the sugar cell is a fixture, and only the Nicol rotates. The reading of the divided circle corresponds to the mean of the planes for the two halves of the field, and this of course differs from the original position of the plane before entering the sugar. This circumstance is usually of no importance, the object being to determine the *rotation* of the plane of polarization when some of the conditions are altered.

A discussion of the accuracy obtainable in polarimetry will be found in a recent paper by Lippich.[5]

Soleil's apparatus.

In Soleil's apparatus, designed for practical use in the estimation of the strength of sugar solutions, the rotation due to the sugar is compensated by a wedge of quartz. Two wedges, one of right-handed and the other of left-handed quartz, may be fitted together, so that a movement of the combination in either direction increases the thickness of one variety traversed and diminishes that of the other. The linear movement required to compensate the introduction of a tube of syrup measures the quantity of sugar present.

§ 24. *Dynamical Theory of Diffraction.*

The explanation of diffraction phenomena given by Fresnel and his followers is independent of special views as to the nature of the ether, at least in its main features; for in the absence of a more complete foundation it is impossible to treat rigorously the mode of action of a solid obstacle such as a screen. The full solution of problems of this kind is scarcely to be expected. Even in the much simpler case of sound, where we know what we have to deal with, the mathematical difficulties are formidable; and we are not able to solve even such an apparently elementary question as the transmission of sound past a rigid infinitely thin plane screen, bounded by a straight edge, or perforated with a circular aperture. But, without entering upon matters of this kind, we may inquire in what manner a primary wave may be resolved into elementary secondary waves, and in particular as to the law of intensity and polarization, in a secondary wave as dependent upon its direction of propagation, and upon the character as regards polarization of the primary wave. This question is treated by Stokes in his "Dynamical Theory of Diffraction"[6] on the basis of the elastic solid theory.

Equations for elastic solid.

Let x, y, z be the co-ordinates of any particle of the medium in its natural state, and ξ, η, ζ the displacements of the same particle at the end of time t, measured in the directions of the three axes respectively. Then the first of the equations of motion may be put under the form

$$\frac{d^2\xi}{dt^2} = b^2\left(\frac{d^2\xi}{dx^2} + \frac{d^2\xi}{dy^2} + \frac{d^2\xi}{dz^2}\right) + (a^2 - b^2)\frac{d}{dx}\left(\frac{d\xi}{dx} + \frac{d\eta}{dy} + \frac{d\zeta}{dz}\right),$$

where a^2 and b^2 denote the two arbitrary constants. Put for shortness

$$\frac{d\xi}{dx} + \frac{d\eta}{dy} + \frac{d\zeta}{dz} = \delta \quad . \quad . \quad . \quad . \quad . \quad . \quad (1),$$

and represent by $\nabla^2\xi$ the quantity multiplied by b^2. According to this notation, the three equations of motion are

$$\left.\begin{aligned} \frac{d^2\xi}{dt^2} &= b^2\nabla^2\xi + (a^2 - b^2)\frac{d\delta}{dx} \\ \frac{d^2\eta}{dt^2} &= b^2\nabla^2\eta + (a^2 - b^2)\frac{d\delta}{dy} \\ \frac{d^2\zeta}{dt^2} &= b^2\nabla^2\zeta + (a^2 - b^2)\frac{d\delta}{dz} \end{aligned}\right\} \quad . \quad . \quad . \quad . \quad (2).$$

It is to be observed that δ denotes the dilatation of volume of the element situated at (x, y, z). In the limiting case in which the medium is regarded as absolutely incompressible δ vanishes; but in order that equations (2) may preserve their generality, we must suppose a at the same time to become infinite, and replace $a^2\delta$ by a new function of the co-ordinates.

Plane waves.

These equations simplify very much in their application to plane waves. If the ray be parallel to OX, and the direction of vibration parallel to OZ, we have $\xi = 0$, $\eta = 0$, while ζ is a function of x and t only. Equation (1) and the first pair of equations

---

[1] It would seem that the two varieties could be chemically distinguished only by their relations with bodies themselves right-handed or left-handed.

[6] *Camb. Phil. Trans.*, vol. ix. p. 1; reprint, vol. ii. p. 243.

(2) are thus satisfied identically. The third equation gives

$$\frac{d^2\zeta}{dt^2}=b^2\frac{d^2\zeta}{dx^2} \quad . \; . \; . \; . \; . \; . \; . \; . \quad (3),$$

of which the solution is

$$\zeta=f(bt-x) \quad . \; . \; . \; . \; . \; . \; . \; . \quad (4)$$

where f is an arbitrary function.

Stokes's law of secondary wave.

The question as to the law of the secondary waves is thus answered by Stokes. "Let $\xi=0$, $\eta=0$, $\zeta=f(bt-x)$ be the displacements corresponding to the incident light; let O_1 be any point in the plane P (of the wave-front), dS an element of that plane adjacent to O_1; and consider the disturbance due to that portion only of the incident disturbance which passes continually across dS. Let O be any point in the medium situated at a distance from the point O_1 which is large in comparison with the length of a wave; let $O_1O=r$, and let this line make an angle θ with the direction of propagation of the incident light, or the axis of x and ϕ with the direction of vibration, or axis of z. Then the displacement at O will take place in a direction perpendicular to O_1O, and lying in the plane ZO_1O; and, if ζ' be the displacement at O, reckoned positive in the direction nearest to that in which the incident vibrations are reckoned positive,

$$\zeta'=\frac{dS}{4\pi r}(1+\cos\theta)\sin\phi\, f'(bt-r).$$

In particular, if

$$f(bt-x)=c\sin\frac{2\pi}{\lambda}(bt-x) \quad . \; . \; . \; . \quad (5),$$

we shall have

$$\zeta'=\frac{c\,dS}{2\lambda r}(1+\cos\theta)\sin\phi\cos\frac{2\pi}{\lambda}(bt-r) \quad . \; . \quad (6)."$$

It is then verified that, after integration with respect to dS, (6) gives the same disturbance as if the primary wave had been supposed to pass on unbroken.

The occurrence of $\sin\phi$ as a factor in (6) shows that the relative intensities of the primary light and of that diffracted in the direction θ depend upon the condition of the former as regards polarization. If the direction of primary vibration be perpendicular to the plane of diffraction (containing both primary and secondary rays), $\sin\phi=1$; but, if the primary vibration be in the plane of diffraction, $\sin\phi=\cos\theta$. This result was employed by Stokes as a criterion of the direction of vibration; and his experiments, conducted with gratings, led him to the conclusion that the vibrations of polarized light are executed in a direction *perpendicular* to the plane of polarization.

The factor $(1+\cos\theta)$ shows in what manner the secondary disturbance depends upon the direction in which it is propagated with respect to the front of the primary wave.

Analogy of sound.

If, as suffices for all practical purposes, we limit the application of the formulæ to points in advance of the plane at which the wave is supposed to be broken up, we may use simpler methods of resolution than that above considered. It appears indeed that the purely mathematical question has no definite answer. In illustration of this the analogous problem for sound may be referred to. Imagine a flexible lamina to be introduced so as to coincide with the plane at which resolution is to be effected. The introduction of the lamina (supposed to be devoid of inertia) will make no difference to the propagation of plane parallel sonorous waves through the position which it occupies. At every point the motion of the lamina will be the same as would have occurred in its absence, the pressure of the waves impinging from behind being just what is required to generate the waves in front. Now it is evident that the aerial motion in front of the lamina is determined by what happens at the lamina without regard to the cause of the motion there existing. Whether the necessary forces are due to aerial pressures acting on the rear, or to forces directly impressed from without, is a matter of indifference. The conception of the lamina leads immediately to two schemes, according to which a primary wave may be supposed to be broken up. In the first of these the element dS, the effect of which is to be estimated, is supposed to execute its actual motion, while every other element of the plane lamina is maintained at rest. The resulting aerial motion in front is readily calculated;[1] it is symmetrical with respect to the origin, *i.e.*, independent of θ. When the secondary disturbance thus obtained is integrated with respect to dS over the entire plane of the lamina, the result is necessarily the same as would have been obtained had the primary wave been supposed to pass on without resolution, for this is precisely the motion generated when every element of the lamina vibrates with a common motion, equal to that attributed to dS. The only assumption here involved is the evidently legitimate one that, when two systems of variously distributed motion at the lamina are superposed, the corresponding motions in front are superposed also.

Various methods of resolution.

The method of resolution just described is the simplest, but it is only one of an indefinite number that might be proposed, and which are all equally legitimate, so long as the question is regarded as a merely mathematical one, without reference to the physical properties of actual screens. If, instead of supposing the *motion* at dS to be that of the primary wave, and to be zero elsewhere, we suppose the *force* operative over the element dS of the lamina to be that corresponding to the primary wave, and to vanish elsewhere, we obtain a secondary wave following quite a different law.[2] In this case the motion in different directions varies as $\cos\theta$, vanishing at right angles to the direction of propagation of the primary wave. Here again, on integration over the entire lamina, the aggregate effect of the secondary waves is necessarily the same as that of the primary.

Impressed force.

In order to apply these ideas to the investigation of the secondary wave of light, we require the solution of a problem, first treated by Stokes,[3] viz., the determination of the motion in an infinitely extended elastic solid due to a locally applied periodic force. If we suppose that the force impressed upon the element of mass $D\,dx\,dy\,dz$ is

$$DZ\,dx\,dy\,dz,$$

being everywhere parallel to the axis of Z, the only change required in our equations (1), (2) is the addition of the term Z to the second member of the third equation (2). In the forced vibration, now under consideration, Z, and the quantities ξ, η, ζ, δ expressing the resulting motion, are to be supposed proportional to e^{int}, where $i=\sqrt{(-1)}$, and $n=2\pi/\tau$, τ being the periodic time. Under these circumstances the double differentiation with respect to t of any quantity is equivalent to multiplication by the factor $-n^2$, and thus our equations take the form

$$\left.\begin{aligned}(b^2\nabla^2+n^2)\,\xi+(a^2-b^2)\frac{d\delta}{dx}&=0\\(b^2\nabla^2+n^2)\,\eta+(a^2-b^2)\frac{d\delta}{dy}&=0\\(b^2\nabla^2+n^2)\,\zeta+(a^2-b^2)\frac{d\delta}{dz}&=-Z\end{aligned}\right\} \quad . \; . \; . \; . \; . \quad (7).$$

It will now be convenient to introduce the quantities ϖ_1, ϖ_2, ϖ_3, which express the *rotations* of the elements of the medium round axes parallel to those of co-ordinates, in accordance with the equations

$$\varpi_3=\frac{d\xi}{dy}-\frac{d\eta}{dx},\quad \varpi_1=\frac{d\eta}{dz}-\frac{d\zeta}{dy},\quad \varpi_2=\frac{d\zeta}{dx}-\frac{d\xi}{dz} \quad . \; . \quad (8).$$

In terms of these we obtain from (7), by differentiation and substraction,

$$\left.\begin{aligned}(b^2\nabla^2+n^2)\varpi_3&=0\\(b^2\nabla^2+n^2)\varpi_1&=dZ/dy\\(b^2\nabla^2+n^2)\varpi_2&=-dZ/dx\end{aligned}\right\} \quad . \; . \; . \; . \; . \; . \quad (9).$$

The first of equations (9) gives

$$\varpi_3=0 \quad . \; . \; . \; . \; . \; . \; . \; . \; . \quad (10).$$

For ϖ_1 we have

$$\varpi_1=-\frac{1}{4\pi b^2}\iiint\frac{dZ}{dy}\,\frac{e^{-ikr}}{r}\,dx\,dy\,dz \quad . \; . \; . \quad (11),[4]$$

where r is the distance between the element $dx\,dy\,dz$ and the point where ϖ_1 is estimated, and

$$k=n/b=2\pi/\lambda \quad . \; . \; . \; . \; . \; . \; . \; . \quad (12),$$

λ being the wave length.

Force locally applied.

We will now introduce the supposition that the force Z acts only within a small space of volume T, situated at (x, y, z), and for simplicity suppose that it is at the origin of co-ordinates that the rotations are to be estimated. Integrating by parts in (11), we get

$$\int\frac{e^{-ikr}}{r}\,\frac{dZ}{dy}\,dy=\left[Z\frac{e^{-ikr}}{r}\right]-\int Z\frac{d}{dy}\left(\frac{e^{-ikr}}{r}\right)dy,$$

in which the integrated terms at the limits vanish, Z being finite only within the region T. Thus

$$\varpi_1=\frac{1}{4\pi b^2}\iiint Z\frac{d}{dy}\left(\frac{e^{-ikr}}{r}\right)dx\,dy\,dz.$$

Since the dimensions of T are supposed to be very small in comparison with λ, the factor $\frac{d}{dy}\left(\frac{e^{-ikr}}{r}\right)$ is sensibly constant; so that, if Z stand for the mean value of Z over the volume T, we may write

[2] *Loc. cit.*, equation (10).

[3] *Loc. cit.*, §§ 27-30.

[4] This solution may be verified in the same manner as Poisson's theorem, in which $k=0$.

$$\varpi_1 = \frac{\mathrm{TZ}}{4\pi b^2} \cdot \frac{y}{r} \cdot \frac{d}{dr}\left(\frac{e^{-ikr}}{r}\right) \quad . \quad . \quad . \quad . \quad . \quad . \quad (13).$$

In like manner we find

$$\varpi_2 = -\frac{\mathrm{TZ}}{4\pi b^2} \cdot \frac{x}{r} \cdot \frac{d}{dr}\left(\frac{e^{-ikr}}{r}\right) \quad . \quad . \quad . \quad . \quad . \quad . \quad (14).$$

From (10), (13), (14) we see that, as might have been expected, the rotation at any point is about an axis perpendicular both to the direction of the force and to the line joining the point to the source of disturbance. If the resultant rotation be ϖ, we have

$$\varpi = \frac{\mathrm{TZ}}{4\pi b^2} \cdot \frac{\sqrt{(x^2+y^2)}}{r} \cdot \frac{d}{dr}\left(\frac{e^{-ikr}}{r}\right) = \frac{\mathrm{TZ}\sin\phi}{4\pi b^2}\frac{d}{dr}\left(\frac{e^{-ikr}}{r}\right),$$

ϕ denoting the angle between r and z. In differentiating e^{-ikr}/r with respect to r, we may neglect the term divided by r^2 as altogether insensible, kr being an exceedingly great quantity at any moderate distance from the origin of disturbance. Thus

$$\varpi = \frac{-ik \, . \, \mathrm{TZ}\sin\phi}{4\pi b^2} \cdot \frac{e^{-ikr}}{r} \quad . \quad . \quad . \quad . \quad . \quad (15),$$

which completely determines the rotation at any point. For a disturbing force of given integral magnitude it is seen to be everywhere about an axis perpendicular to r and the direction of the force, and in magnitude dependent only upon the angle (ϕ) between these two directions and upon the distance (r).

The intensity of light is, however, more usually expressed in terms of the actual displacement in the plane of the wave. This displacement, which we may denote by ζ', is in the plane containing z and r, and perpendicular to the latter. Its connection with ϖ is expressed by $\varpi = d\zeta'/dr$; so that

$$\zeta' = \frac{\mathrm{TZ}\sin\phi}{4\pi b^2} \cdot \frac{e^{i(nt-kr)}}{r} \quad . \quad . \quad . \quad . \quad . \quad . \quad (16),$$

where the factor e^{int} is restored.

Retaining only the real part of (16), we find, as the result of a local application of force equal to

$$\mathrm{DTZ}\cos nt \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (17),$$

the disturbance expressed by

Resulting disturbance.

$$\zeta' = \frac{\mathrm{TZ}\sin\phi}{4\pi b^2} \cdot \frac{\cos(nt-kr)}{r} \quad . \quad . \quad (18).$$

The occurrence of sin ϕ shows that there is no disturbance radiated in the direction of the force, a feature which might have been anticipated from considerations of symmetry.

We will now apply (18) to the investigation of a law of secondary disturbance, when a primary wave

$$\zeta = \sin(nt - kx) \quad . \quad . \quad . \quad . \quad . \quad . \quad (19)$$

is supposed to be broken up in passing the plane $x = 0$. The first step is to calculate the force which represents the reaction between the parts of the medium separated by $x = 0$. The force operative upon the positive half is parallel to OZ, and of amount per unit of area equal to

$$-b^2 \mathrm{D} d\zeta/dx = b^2 k \mathrm{D}\cos nt;$$

and to this force acting over the whole of the plane the actual motion on the positive side may be conceived to be due. The secondary disturbance corresponding to the element dS of the plane may be supposed to be that caused by a force of the above magnitude acting over dS and vanishing elsewhere; and it only remains to examine what the result of such a force would be.

Law of secondary wave.

Now it is evident that the force in question, supposed to act upon the positive half only of the medium, produces just double of the effect that would be caused by the same force if the medium were undivided, and on the latter supposition (being also localized at a point) it comes under the head already considered. According to (18), the effect of the force acting at dS parallel to OZ, and of amount equal to

$$2b^2 k \mathrm{D}\, d\mathrm{S} \cos nt,$$

will be a disturbance

$$\zeta' = \frac{d\mathrm{S}\sin\phi}{\lambda r}\cos(nt - kr) \quad . \quad . \quad . \quad . \quad . \quad (20),$$

regard being had to (12). This therefore expresses the secondary disturbance at a distance r and in a direction making an angle ϕ with OZ (the direction of primary vibration) due to the element dS of the wave-front.

The proportionality of the secondary disturbance to sin ϕ is common to the present law and to that given by Stokes, but here there is no dependence upon the angle θ between the primary and secondary rays. The occurrence of the factor $(\lambda r)^{-1}$, and the necessity of supposing the phase of the secondary wave accelerated by a quarter of an undulation, were first established by Archibald Smith, as the result of a comparison between the primary wave, supposed to pass on without resolution, and the integrated effect of all the secondary waves (§ 10). The occurrence of factors such as sin ϕ or $\frac{1}{2}(1 + \cos\theta)$, in the expression of the secondary wave has no influence upon the result of the integration, the effects of all the elements for which the factors differ appreciably from unity being destroyed by mutual interference.

Comparison with Stokes's law.

The choice between various methods of resolution, all mathematically admissible, would be guided by physical considerations respecting the mode of action of obstacles. Thus, to refer again to the acoustical analogue in which plane waves are incident upon a perforated rigid screen, the circumstances of the case are best represented by the first method of resolution, leading to symmetrical secondary waves, in which the normal motion is supposed to be zero over the unperforated parts. Indeed, if the aperture is very small, this method gives the correct result, save as to a constant factor. In like manner our present law (20) would apply to the kind of obstruction that would be caused by an actual physical division of the elastic medium, extending over the whole of the area supposed to be occupied by the intercepting screen, but of course not extending to the parts supposed to be perforated. In the present state of our ignorance this law seems to be at least as plausible as any other.

§ 25. *The Diffraction of Light by Small Particles.*

The theory of the diffraction, dispersion, or scattering of light by small particles, as it has variously been called, is of importance, not only from its bearings upon fundamental optical hypotheses, but on account of its application to explain the origin and nature of the light from the sky. The view suggested by Newton and advocated in more recent times by such authorities as Herschel[1] and Clausius,[2] that the light of the sky is a blue of the first order reflected from aqueous particles, was connected with the then prevalent notion that the suspended moisture of clouds and mist was in the form of vesicles or bubbles. Experiments such as those of Brücke[3] pointed to a different conclusion. When a weak alcoholic solution of mastic is agitated with water, the precipitated gum scatters a blue light, obviously similar in character to that from the sky. Not only would it be unreasonable to attribute a vesicular structure to the mastic, but (as Brücke remarked) the dispersed light is much richer in quality than the blue of the first order. Another point of great importance is well brought out in the experiments of Tyndall[4] upon clouds precipitated by the chemical action of light. Whenever the particles are sufficiently fine, the light emitted laterally is blue in color, and, in a direction perpendicular to the incident beam, is *completely polarized.*

About the color there can be no *prima facie* difficulty; for, as soon as the question is raised, it is seen that the standard of linear dimension, with reference to which the particles are called small, is the wave-length of light, and that a given set of particles would (on any conceivable view as to their mode of action) produce a continually increasing disturbance as we pass along the spectrum towards the more refrangible end.

On the other hand, that the direction of complete polarization should be independent of the refracting power of the matter composing the cloud has been considered mysterious. Of course, on the theory of thin plates, this direction would be determined by Brewster's law; but if the particles of foreign matter are small in all their dimensions, the circumstances are materially different from those under which Brewster's law is applicable. The investigation of this question upon the elastic solid theory will depend upon how we suppose the solid to vary from one optical medium to another. The slower propagation of light in glass or water than in air or vacuum may be attributed to a greater density, or to a less rigidity, in the former case; or we may adopt the more complicated supposition that both these quantities vary, subject only to the condition which restricts the ratio of velocities to equality with the known refractive index. It will presently appear that the original hypothesis of Fresnel, that the rigidity remains the same in both media, is the only one that can be reconciled with the facts; and we will therefore investigate upon this basis the nature of the secondary waves dispersed by small particles.

---

[4] *Phil. Mag.* [4], vol. cxxxvii. p. 388.

Conceive a beam of plane polarized light to move among a number of particles, all small compared with any of the wave-lengths. According to our hypothesis, the foreign matter may be supposed to *load* the ether, so as to increase its *inertia* without altering its resistance to distortion. If the particles were away, the wave would pass on unbroken and no light would be emitted laterally. Even with the particles retarding the motion of the ether, the same will be true if, to counterbalance the increased inertia, suitable forces are caused to act on the ether at all points where the inertia is altered. These forces have the same period and direction as the undisturbed luminous vibrations themselves. The light actually emitted laterally is thus the same as would be caused by forces exactly the opposite of these acting on the medium otherwise free from disturbance, and it only remains to see what the effect of such force would be.

On account of the smallness of the particles, the forces acting throughout the volume of any individual particle are all of the same intensity and direction, and may be considered as a whole. The determination of the motion in the ether, due to the action of a periodic force at a given point, is a problem with which we have recently been occupied (§ 24). But, before applying the solution to a mathematical investigation of the present question, it may be well to consider the matter for a few moments from a more general point of view.

Polarization of diffracted light.

In the first place, there is necessarily a complete symmetry round the direction of the force. The disturbance, consisting of transverse vibrations, is propagated outwards in all directions from the centre; and, in consequence of the symmetry, the direction of vibration in any ray lies in the plane containing the ray and the axis of symmetry; that is to say, the direction of vibration in the scattered or diffracted ray makes with the direction of vibration in the incident or primary ray the least possible angle. The symmetry also requires that the intensity of the scattered light should vanish for the ray which would be propagated along the axis; for there is nothing to distinguish one direction transverse to the ray from another. The application of this is obvious. Suppose, for distinctness of statement, that the primary ray is vertical, and that the plane of vibration is that of the meridian. The intensity of the light scattered by a small particle is constant, and a maximum, for rays which lie in the vertical plane running east and west, while there is *no scattered ray along the north and south line.* If the primary ray is unpolarized, the light scattered north and south is entirely due to that component which vibrates east and west, and is therefore *perfectly polarized,* the direction of its vibration being also east and west. Similarly any other ray scattered horizontally is perfectly polarized, and the vibration is performed in the horizontal plane. In other directions the polarization becomes less and less complete as we approach the vertical.

The observed facts as to polarization are thus readily explained, and the general law connecting the intensity of the scattered light with the wave-length follows almost as easily from considerations of *dimensions.*

Method of dimensions.

The object is to compare the intensities of the incident and scattered light, for these will clearly be proportional. The number (i) expressing the ratio of the two amplitudes is a function of the following quantities: (T) the volume of the disturbing particle; (r) the distance of the point under consideration from it; (λ) the wave-length; (b) the velocity of propagation of light; (D) and (D′) the original and altered densities: of which the first three depend only upon space, the fourth on space and time, while the fifth and sixth introduce the consideration of mass. Other elements of the problem there are none, except mere numbers and angles, which do not depend upon the fundamental measurements of space, time, and mass. Since the ratio (i), whose expression we seek, is of no dimensions in mass, it follows at once that D and D′ occur only under the form D : D′, which is a simple number and may therefore be disregarded. It remains to find how i varies with T, r, λ, b.

Now, of these quantities, b is the only one depending on time; and therefore, as i is of no dimensions in time, b cannot occur in its expression.

Moreover, since the same amount of energy is propagated across all spheres concentric with the particle, we recognize that i varies as r. It is equally evident that i varies as T, and therefore that it must be proportional to T/λr, T being of three dimensions in space. In passing from one part of the spectrum to another, λ is the only quantity which varies, and we have the important law:

Law of intensities.

When light is scattered by particles which are very small compared with any of the wave-lengths, the ratio of the amplitudes of the vibrations of the scattered and incident lights varies inversely as the square of the wave-length, and the ratio of *intensities* as the inverse fourth power.

The light scattered from small particles is of a much richer blue than the blue of the first order as reflected from a very thin plate. From the general theory (§ 8), or by the method of dimensions, it is easy to prove that in the latter case the intensity varies as λ^{-2}, instead of λ^{-4}.

Intensity of transmitted light.

The principle of energy makes it clear that the light emitted laterally is not a new creation, but only diverted from the main stream. If I represent the intensity of the primary light after traversing a thickness x of the turbid medium we have

$$dI = -hI\lambda^{-4}dx,$$

where h is a constant independent of λ. On integration.

$$\log(I/I_0) = -h\lambda^{-4}x \quad . \quad . \quad . \quad . \quad . \quad (1),$$

if I_0 correspond to $x = 0$,—a law altogether similar to that of absorption, and showing how the light tends to become yellow and finally red as the thickness of the medium increases.[1]

Captain Abney has found that the above law agrees remarkably well with his observations on the transmission of light through water in which particles of mastic are suspended.[2]

Mathematical investigation.

We may now investigate the mathematical expression for the disturbance propagated in any direction from a small particle upon which a beam of light strikes. Let the particle be at the origin of co-ordinates, and let the expression for the primary vibration be

$$\zeta = \sin(nt - kx) \quad . \quad . \quad . \quad . \quad . \quad . \quad (2).$$

The acceleration of the element at the origin is $-n^2 \sin nt$; so that the force which would have to be applied to the parts where the density is D′ (instead of D), in order that the waves might pass on undisturbed, is per unit of volume,

$$-(D' - D)\, n^2 \sin nt.$$

To obtain the total force which must be supposed to act, the factor T (representing the volume of the particle) must be introduced. The opposite of this, conceived to act at O, would give the same disturbance as is actually caused by the presence of the particle. Thus by (18) (§ 24) the secondary disturbance is expressed by

$$\begin{aligned}\zeta' &= \frac{D' - D}{D}\,\frac{n^2 T \sin\phi}{4\pi b^2}\,\frac{\sin(nt - kr)}{r}\\ &= \frac{D' - D}{D}\,\frac{\pi T \sin\phi}{\lambda^2 r}\sin(nt - kr) \quad . \quad . \quad . \quad . \quad (3).^3\end{aligned}$$

The preceding investigation is based upon the assumption that in passing from one medium to another the rigidity of the ether does not change. If we forego this assumption, the question is necessarily more complicated; but, on the supposition that the changes of rigidity (ΔN) and of density (ΔD) are relatively small, the results are fairly simple. If the primary wave be represented by

$$\zeta = e^{-ikx} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4),$$

General expressions.

the component rotations in the secondary wave are

$$\left.\begin{aligned}\varpi_3 &= P\left(\frac{\Delta N}{N}\,\frac{yz}{r^2}\right),\\ \varpi_1 &= P\left(\frac{\Delta D}{D}\,\frac{y}{r} + \frac{\Delta N}{N}\,\frac{xy}{r^2}\right),\\ \varpi_2 &= P\left(-\frac{\Delta D}{D}\,\frac{x}{r} + \frac{\Delta N}{N}\,\frac{z^2 - x^2}{r^2}\right)\end{aligned}\right\} \quad . \quad . \quad . \quad (5),$$

where

$$P = \frac{ik^3 T}{4\pi}\,\frac{e^{-ikr}}{r} \quad . \quad . \quad . \quad . \quad . \quad . \quad (6).$$

The expression for the resultant rotation in the general case would be rather complicated and is not needed for our purpose. It is easily seen to be about an axis perpendicular to the scattered ray (x, y, z), inasmuch as

---

[1] "On the Light from the Sky, its Polarization and Color." *Phil., Mag.*, Feb., 1871.

[2] *Proc. Roy. Soc.*, May, 1886.

[3] In strictness the force must be supposed to act upon the medium in its actual condition, whereas in (18) the medium is supposed to be absolutely uniform. It is not difficult to prove that (3) remains unaltered, when this circumstance is taken into account, and it is evident in any case that a correction would depend upon the square of (D′ − D).

$$x\varpi_1 + y\varpi_2 + z\varpi_3 = 0.$$

Either ΔN or ΔD vanishes.

Let us consider the more special case of a ray scattered normally to the incident ray, so that $x = 0$. We have

$$\varpi^2 = \varpi_1^2 + \varpi_2^2 + \varpi_3^2 = \mathrm{P}^2\left(\frac{\Delta \mathrm{N}}{\mathrm{N}}\right)^2\frac{z^2}{r^2} + \mathrm{P}^2\left(\frac{\Delta \mathrm{D}}{\mathrm{D}}\right)^2\frac{y^2}{r^2} \quad . \quad (7).$$

If **ΔN**, **ΔD**, be both finite, we learn from (7) that there is no direction perpendicular to the primary (polarized) ray in which the secondary light vanishes. Now experiment tells us plainly that there is such a direction, and therefore we are driven to the conclusion that either **ΔN** or **ΔD** must vanish.

The consequences of supposing **ΔN** to be zero have already been traced. They agree very well with experiment, and require us to suppose that the vibrations are perpendicular to the plane of polarization. So far as (7) is concerned the alternative supposition that **ΔD** vanishes would answer equally well, if we suppose the vibrations to be executed in the plane of polarization; but let us now revert to (5), which gives

$$\varpi_3 = -\frac{\mathrm{P}\Delta \mathrm{N}}{\mathrm{N}}\frac{yz}{r^2}, \quad \varpi_1 = \frac{\mathrm{P}\Delta \mathrm{N}}{\mathrm{N}}\frac{xy}{r^2}, \quad \varpi_2 = \frac{\mathrm{P}\Delta \mathrm{N}}{\mathrm{N}}\frac{z^2 - x^2}{r^2} \quad (8).$$

ΔN must vanish.

According to these equations there would be, in all, six directions from O along which there is no scattered light,—two along the axis of y normal to the original ray, and four $(y = 0, z = \pm x)$ at angles of 45° with that ray. So long as the particles are small no such vanishing of light in oblique directions is observed, and we are thus led to the conclusion that the hypothesis of a finite **ΔN** and of vibration in the plane of polarization cannot be reconciled with the facts. No form of the elastic solid theory is admissible except that in which the vibrations are supposed to be perpendicular to the plane of polarization, and the difference between one medium and another to be a difference of density only.[1]

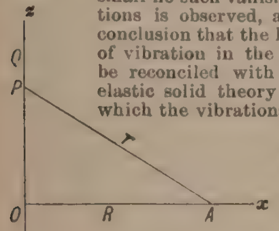

Fig. 26.

Before leaving this subject it may be instructive to show the application of a method, similar to that used for small particles, to the case of an obstructing *cylinder*, whose axis is parallel to the fronts of the primary waves. We will suppose (1) that the variation of optical properties depends upon a difference of density (D′— D), and is small in amount; (2) that the diameter of the cylinder is very small in comparison with the wavelength of light.

Cylindrical obstruction.

Let the axis of the cylinder be the axis of z (Fig. 26), and (as before) let the incident light be parallel to x. The original vibration is thus, in the principal cases, parallel to either z or y. We will take first the former case, where the disturbance due to the cylinder must evidently be symmetrical round OZ and parallel to it. The element of the disturbance at A, due to PQ (dz), will be proportional to dz in amplitude, and will be retarded in phase by an amount corresponding to the distance r. In calculating the effect of the whole bar we have to consider the integral

$$\int_0^\infty \frac{dz}{r}\sin(nt - kr) = \int_{\mathrm{R}}^\infty \frac{dr\sin(nt - kr)}{\sqrt{(r^2 - \mathrm{R}^2)}}.$$

The integral on the left may be treated as in § 15, and we find

$$\int_{-\infty}^{\infty} r^{-1}\sin(nt - kr)dz = \sqrt{(\lambda/\mathrm{R})}\sin(nt - k\mathrm{R} - \tfrac{1}{4}\pi),$$

showing that the total effect is retarded $\tfrac{1}{8}\lambda$ behind that due to the central element at O. We have seen (3) that, if σ be the sectional area, the effect of the element PQ is

$$\frac{\mathrm{D}' - \mathrm{D}}{\mathrm{D}}\frac{\pi\sigma dz\sin\phi}{\lambda^2 r}\sin(nt - kr),$$

where ϕ is the angle OPA. In strictness this should be reckoned perpendicular to PA, and therefore, considered as a contribution to the resultant at A, should be multiplied by $\sin\phi$. But the factor $\sin^2\phi$, being sensibly equal to unity for the only parts which are really operative, may be omitted without influencing the result. In this way we find, for the disturbance at A,

$$\frac{\mathrm{D}' - \mathrm{D}}{\mathrm{D}}\frac{\pi\sigma}{\lambda^{\frac{3}{2}}\mathrm{R}^{\frac{1}{2}}}\sin(nt - k\mathrm{R} - \tfrac{1}{4}\pi) \quad . \quad . \quad . \quad . \quad (9),$$

corresponding to the incident wave $\sin(nt - kx)$.

When the original vibration is parallel to y, the disturbance due to the cylinder will no longer be symmetrical about OZ. If α be the angle between OX and the scattered ray, which is of course always perpendicular to OZ, it is only necessary to introduce the factor $\cos\alpha$ in order to make the previous expression (9) applicable.

The investigation shows that the light diffracted by an ideal wire-grating would, according to the principles of Fresnel, follow the law of polarization enunciated by Stokes. On the other hand, this law would be departed from were we to suppose that there is any difference of rigidity between the cylinder and the surrounding medium.

§ 26. *Reflection and Refraction.*

So far as the directions of the rays are concerned, the laws of reflection and refraction were satisfactorily explained by Huygens on the principles of the wave theory. The question of the *amount* of light reflected, as dependent upon the characters of the media and upon the angle of incidence, is a much more difficult one, and cannot be dealt with *a priori* without special hypotheses as to the nature of the luminous vibrations, and as to the cause of the difference between various media. By a train of reasoning, not strictly dynamical, but of great ingenuity, Fresnel was led to certain formulæ, since known by his name, expressing the ratio of the reflected to the incident vibration in terms of one constant (μ). If θ be the angle of incidence and θ_1 the angle of refraction, Fresnel's expression for light polarized in the plane of incidence is

Fresnel's formulæ.

$$\frac{\sin(\theta - \theta_1)}{\sin(\theta + \theta_1)} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (1),$$

where the relation between the angles θ, θ_1, and μ (the relative refractive index) is, as usual,

$$\sin\theta = \mu\sin\theta_1 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (2).$$

In like manner, for light polarized perpendicularly to the plane of incidence, Fresnel found

$$\frac{\tan(\theta - \theta_1)}{\tan(\theta + \theta_1)} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (3).$$

In the particular case of perpendicular incidence, both formulæ coincide with one previously given by Young, viz.,

$$(\mu - 1)/(\mu + 1) \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4).$$

Since these formulæ agree fairly well with observation, and are at any rate the simplest that can at all represent the facts, it may be advisable to consider their significance a little in detail. As θ increases from 0 to $\tfrac{1}{2}\pi$, the sine-formula increases from Young's value to unity. We may see this most easily with the aid of a slight transformation:

$$\frac{\sin(\theta - \theta_1)}{\sin(\theta + \theta_1)} = \frac{1 - \tan\theta_1/\tan\theta}{1 + \tan\theta_1/\tan\theta} = \frac{\mu - \cos\theta/\cos\theta_1}{\mu + \cos\theta/\cos\theta_1}.$$

Now, writing $\cos\theta/\cos\theta_1$ in the form

$$\sqrt{\left\{\frac{1 - \sin^2\theta}{1 - \mu^{-2}\sin^2\theta}\right\}},$$

we recognize that, as θ increases from 0 to $\tfrac{1}{2}\pi$, $\cos\theta/\cos\theta_1$ diminishes continuously from 1 to 0, and therefore (1) increases from $(\mu - 1)/(\mu + 1)$ to unity.

It is quite otherwise with the tangent-formula. Commencing at Young's value, it diminishes, as θ increases, until it attains zero, when $\theta + \theta_1 = \tfrac{1}{2}\pi$, or $\sin\theta_1 = \cos\theta$; or by (2) $\tan\theta = \mu$. This is the polarizing angle defined by Brewster. It presents itself here as the angle of incidence for which there is no reflection of the polarized light under consideration. As the angle of incidence passes through the polarizing angle, the reflected vibration changes sign, and increases in numerical value until it attains unity at a grazing incidence $(\theta = \tfrac{1}{2}\pi)$.

Total reflection.

We have hitherto supposed that the second medium (into which the light enters at the refracting surface) is the denser. In the contrary case, total reflection sets in as soon as $\sin\theta = \mu^{-1}$, at which point θ_1 becomes imaginary. We shall be able to follow this better in connection with a mechanical theory.

If light falls upon the first surface of a parallel plate at the polarizing angle, the refracted ray also meets the second surface of the plate at the appropriate polarizing angle. For if μ be the index of the second medium relatively to the first, the tangent of the angle of incidence, which is also the cotangent of the angle of refraction, is equal to μ. At the second surface (the third medium being the same as the first) the angles of incidence and refraction are interchanged, and therefore the condition for the polarizing angle is satisfied, since the index for the second refraction is μ^{-1}.

---

[1] See a paper, "On the Scattering of Light by Small Particles," *Phil. Mag.*, June, 1871

Oblique polarization.

The principal formulæ apply to light polarized in, and perpendicular to, the plane of incidence. If the plane of polarization make an angle a with that of incidence, the original vibration may be resolved into two,—$\cos a$ polarized in the plane of incidence, and $\sin a$ polarized in the perpendicular plane These components are reflected according to the laws already considered, and reconstitute plane-polarized light, of intensity

$$\cos^2 a \frac{\sin^2(\theta-\theta_1)}{\sin^2(\theta+\theta_1)} + \sin^2 a \frac{\tan^2(\theta-\theta_1)}{\tan^2(\theta+\theta_1)} \quad . \quad . \quad (5).$$

If the incident light be polarized in a plane making 45° with the plane of incidence, or be circularly-polarized (§ 20), or be unpolarized, (5) applies to the reflected light, with substitution of $\frac{1}{2}$ for $\cos^2 a$ and $\sin^2 a$. If β denote in the general case the angle between the plane of incidence and that in which the reflected light is polarized,

$$\tan\beta = \tan a \frac{\cos(\theta+\theta_1)}{\cos(\theta-\theta_1)} \quad . \quad . \quad . \quad . \quad . \quad (6),$$

a result the approximate truth of which has been verified by Fresnel and Brewster.

Reflected rays.

The formulæ for the intensities of the refracted light follow immediately from the corresponding formulæ relative to the reflected light in virtue of the principle of energy. The simplest way to regard the matter is to suppose the refracted light to emerge from the second medium into a third medium similar to the first without undergoing loss from a second reflection, a supposition which would be realized if the transition between the two media were very gradual instead of abrupt. The intensities of the different lights may then be measured in the same way; and the supposition that no loss of energy is incurred when the incident light gives rise to the reflected and refracted lights requires that the sum of the squares of the vibrations representing the latter shall be equal to the square of the vibration representing the former, viz., unity. We thus obtain, in the two cases corresponding to (1) and (3),

$$1 - \frac{\sin^2(\theta-\theta_1)}{\sin^2(\theta+\theta_1)} = \frac{\sin 2\theta \sin 2\theta_1}{\sin^2(\theta+\theta_1)} \quad . \quad . \quad . \quad (7),$$

$$1 - \frac{\tan^2(\theta-\theta_1)}{\tan^2(\theta+\theta_1)} = \frac{\sin 2\theta \sin 2\theta_1}{\sin^2(\theta+\theta_1)\cos^2(\theta-\theta_1)} \quad (8).$$

A plate of glass, or a pile of parallel plates, is often convenient as a polarizer, when it is not necessary that the polarization be quite complete. At the precise angle of incidence ($\tan^{-1}\mu$) there would be, according to Fresnel's formulæ, only one kind of polarized light reflected, even when the incident light is unpolarized. The polarization of the transmitted light, on the other hand, is imperfect; but it improves as the number of plates is increased.

Reflection by a plate.

If we suppose that there is no regular interference, the intensity (r) of the light reflected from a plate is readily calculated by a geometric series when the intensity (ρ) of the light reflected from a single surface is known. The light reflected from the first surface is ρ. That transmitted by the first surface, reflected at the second, and then transmitted at the first, is $\rho(1-\rho)^2$. The next component, reflected three times and transmitted twice, is $\rho^3(1-\rho)^2$, and so on. Hence

$$r = \rho + (1-\rho)^2\left\{\rho + \rho^3 + \rho^5 + \ldots\right\} = \frac{2\rho}{1+\rho} \quad . \quad . \quad (9).$$

Pile of plates.

The intensity of the light reflected from a pile of plates has been investigated by Provostaye and Desains.[1] If $\phi(m)$ be the reflection from m plates, we may find as above for the reflection from $(m+1)$ plates,

$$\phi(m+1) = r + (1-r)^2\phi(m)\{1 + r\phi(m) + r^2[\phi(m)]^2 + r^3[\phi(m)]^3 + \ldots\}$$

$$\frac{r+(1-2r)\phi(m)}{1-r\phi(m)}$$

By means of this expression we may obtain in succession the values of $\phi(2)$, $\phi(3)$, etc., in terms of $\phi(1)$, viz., r. The general value is

$$\phi(m) = \frac{mr}{1+(m-1)r} \quad . \quad . \quad . \quad . \quad . \quad (10),$$

as may easily be verified by substitution.

The corresponding expression for the light *transmitted* by a pile of m plates is

$$\psi(m) = 1 - \phi(m) = \frac{1-r}{1+(m-1)r} \quad . \quad . \quad . \quad (11).$$

The investigation has been extended by Stokes so as to cover the case in which the plates exercise an absorbing influence.[2]

The verification of Fresnel's formulæ by direct photometric measurement is a matter of some difficulty. The proportion of perpendicularly incident light transmitted by a glass plate has been investigated by Rood;[3] but the deficiency may have been partly due to absorption. If we attempt to deal directly with the reflected light the experimental difficulties are much increased; but the evidence is in favor of the approximate correctness of Fresnel's formulæ when light is reflected nearly perpendicularly from a recently polished glass surface. When the surface is old, even though carefully cleaned, there may be a considerable falling off of reflected power.[4]

We have seen that according to Fresnel's tangent-formula there would be absolutely no reflection of light polarized perpendicularly to the plane of incidence, when the angle of incidence is $\tan^{-1}\mu$, or, which comes to the same thing, common light reflected at this angle could be perfectly extinguished with a Nicol's prism.

It was first observed by Airy that in the case of the diamond and other highly refracting media this law is only approximately in accordance with the facts. It is readily proved by experiment that, whatever be the angle of incidence, sunlight reflected from a plate of black glass is incapable of being quenched by a Nicol, and is therefore imperfectly plane-polarized.

Jamin's observations.

This subject has been studied by Jamin. The character of the reflected vibration can be represented, as regards both amplitude and phase, by the situation in a plane of a point P relatively to the origin of co-ordinates O. The length of the line OP represents the amplitude, while the inclination of OP to the axis of x represents the phase. According to Fresnel's formula appropriate to light polarized perpendicularly to the plane of incidence, P is situated throughout on the axis of x, passing through O when the angle of incidence is $\tan^{-1}\mu$. Jamin found, however, that in general P does not pass through O but above or below it. When P is on the axis of y, the amplitude is a minimum, and the phase is midway between the extreme phases. For one class of bodies the phase is in arrear of that corresponding to perpendicular incidence, and for another class of bodies in advance. In a few intermediate cases P passes sensibly through O; and then the change of phase is sudden, and the minimum amplitude is zero.

Metallic reflection.

In the case of metals the polarization produced by reflection is still more incomplete. Light polarized perpendicularly to the plane of incidence is reflected at all angles, the amount, however, decreasing as the angle of incidence increases from 0° to about 75°, and then again increasing up to a grazing incidence. The most marked effect is the relative retardation of one polarized component with respect to the other. At an angle of about 75° this retardation amounts to a quarter period.

The intensity of reflection from metals is often very high. From silver, even at perpendicular incidence, as much as 95 per cent. of the incident light is reflected. There is reason for regarding the high reflecting power of metals as connected with the intense absorption which they exercise. Many aniline dyes reflect in abnormal proportion from their surface those rays of the spectrum to which they are most opaque. The peculiar absorption spectrum of permanganate of potash is reproduced in the light reflected from a surface of a crystal.[5]

§ 27. *Reflection on the Elastic Solid Theory.*

On the theory which assimilates the ether to an elastic solid, the investigation of reflection and refraction presents no very serious difficulties, but the results do not harmonize very well with optical observation. It is, however, of some importance to understand that reflection and refraction can be explained, at least in their principal features, on a perfectly definite and intelligible theory, which, if not strictly applicable to the ether, has at any rate a distinct mechanical significance. The refracting surface and the wave-fronts may for this purpose be supposed to be plane.

Vibrations perpendicular to plane of incidence.

When the vibrations are perpendicular to the plane of incidence ($z=0$), the solution of the problem is very simple. We suppose that the refracting surface is $x=0$, the rigidity and density in the first medium being N, D, and in the second N_1, D_1. The displacements in the two media are in general denoted by ξ, η, ζ; ξ_1, η_1, ζ_1, but in the present case ξ, η, ξ_1, η_1 all vanish. Moreover ζ, ζ_1 are independent of z. The equations to be satisfied in the interior of the media are accordingly (§ 24)

[5] Stokes, "On the Metallic Reflection exhibited by Certain Non-Metallic Substances," *Phil. Mag.*, Dec., 1853.

$$\frac{d^2\zeta}{dt^2}=\frac{N}{D}\left(\frac{d^2\zeta}{dx^2}+\frac{d^2\zeta}{dy^2}\right) \quad . \quad . \quad . \quad . \quad . \quad . \quad (1),$$

$$\frac{d^2\zeta_1}{dt^2}=\frac{N_1}{D_1}\left(\frac{d^2\zeta_1}{dx^2}+\frac{d^2\zeta_1}{dy^2}\right) \quad . \quad . \quad . \quad . \quad . \quad . \quad (2).$$

At the boundary the conditions to be satisfied are the continuity of displacement and of stress; so that, when $x=0$,

$$\zeta=\zeta_1, \qquad N\frac{d\zeta}{dx}=N_1\frac{d\zeta_1}{dx} \quad . \quad . \quad . \quad . \quad . \quad . \quad (3).$$

The incident waves may be represented by

$$\zeta=e^{i(ax+by+ct)},$$

where

$$Dc^2=N(a^2+b^2) \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4);$$

and $ax+by=$ const. gives the equation of the wave-fronts. The reflected and refracted waves may be represented by

$$\zeta=\zeta' e^{i(-ax+by+ct)} \quad . \quad . \quad . \quad . \quad . \quad . \quad (5),$$

$$\zeta_1=\zeta_1' e^{i(a_1x+by+ct}, \quad . \quad . \quad . \quad . \quad . \quad . \quad (6).$$

The coefficient of t is necessarily the same in all three waves on account of the periodicity, and the coefficient of y must be the same since the traces of all the waves upon the plane of separation must move together. With regard to the coefficient of x, it appears by substitution in the differential equations that its sign is changed in passing from the incident to the reflected wave; in fact

$$c^2=V^2\{(\pm a)^2+b^2\}=V_1^2\{a_1^2+b^2\} \quad . \quad . \quad . \quad (7),$$

where V, V_1 are the velocities of propagation in the two media given by

$$V^2=N/D, \qquad V_1^2=N_1/D_1 \quad . \quad . \quad . \quad . \quad . \quad (8).$$

Now $b/\sqrt{(a^2+b^2)}$ is the sine of the angle included between the axis of x and the normal to the plane of waves—in optical language, the sine of the angle of incidence—and $b/\sqrt{(a_1^2+b^2)}$ is in like manner the sine of the angle of refraction. If these angles be denoted (as before) by θ, θ_1, (7) asserts that $\sin\theta : \sin\theta_1$ is equal to the constant ratio $V : V_1$, the well-known law of sines. The laws of reflection and refraction follow simply from the fact that the velocity of propagation normal to the wave-fronts is constant in each medium, that is to say, independent of the *direction* of the wave-front, taken in connection with the equal velocities of the traces of all the waves on the plane of separation ($V/\sin\theta=V_1/\sin\theta_1$).

The boundary conditions (3) now give

$$1+\zeta'=\zeta_1', \qquad Na(1-\zeta')=N_1a_1\zeta_1' \quad . \quad . \quad . \quad (9),$$

whence

$$\zeta'=\frac{Na-N_1a_1}{Na+N_1a_1} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (10),$$

Realized expressions.

a formula giving the reflected wave in terms of the incident wave (supposed to be unity). This completes the symbolical solution. If a_1 (and θ_1) be real, we see that, if the incident wave be

$$\zeta=\cos(ax+by+ct),$$

or in terms of V, λ, and θ,

$$\zeta=\cos\frac{2\pi}{\lambda}(x\cos\theta+y\sin\theta+Vt) \quad . \quad . \quad . \quad (11),$$

the reflected wave is

$$\zeta=\frac{N\cot\theta-N_1\cot\theta_1}{N\cot\theta+N_1\cot\theta_1}\cos\frac{2\pi}{\lambda}(-x\cos\theta+y\sin\theta+Vt) \quad . \quad (12).$$

The formula for intensity of the reflected wave is here obtained on the supposition that the waves are of harmonic type; but, since it does not involve λ and there is no change of phase, it may be extended by Fourier's theorem to waves of any type whatever. It may be remarked that when the first and second media are interchanged the coefficient in (12) simply changes sign, retaining its numerical value.

Alternative suppositions.

The amplitude of the reflected wave, given in general by (12), assumes special forms when we introduce more particular suppositions as to the nature of the difference between media of diverse refracting power. According to Fresnel and Green the rigidity does not vary, or $N=N_1$. In this case

$$\frac{N\cot\theta-N_1\cot\theta_1}{N\cot\theta+N_1\cot\theta}=\frac{\cot\theta-\cot\theta_1}{\cot\theta+\cot\theta_1}=\frac{\sin(\theta_1-\theta)}{\sin(\theta_1+\theta)}.$$

If, on the other hand, the density is the same in various media,

$$N_1 : N=V_1^2 : V^2=\sin^2\theta_1 : \sin^2\theta,$$

and then

$$\frac{N\cot\theta-N_1\cot\theta_1}{N\cot\theta+N_1\cot\theta_1}=\frac{\tan(\theta_1-\theta)}{\tan(\theta_1+\theta)}.$$

If we assume the complete accuracy of Fresnel's expressions, either alternative agrees with observation; only, if $N=N_1$, light must be supposed to vibrate normally to the plane of polarization; while, if $D=D_1$, the vibrations are parallel to that plane.

An intermediate supposition, according to which the refraction is regarded as due partly to a difference of density and partly to a difference of rigidity, could scarcely be reconciled with observation, unless one variation were very subordinate to the other. But the most satisfactory argument against the joint variation is that derived from the theory of the diffraction of light by small particles (§ 25).

Total reflection.

We will now, limiting ourselves for simplicity to Fresnel's supposition ($N_1=N$), inquire into the character of the solution when total reflection sets in. The symbolical expressions for the reflected and refracted waves are

$$\zeta=\frac{a-a_1}{a+a_1}e^{i(-ax+by+ct)} \quad . \quad . \quad . \quad . \quad . \quad . \quad (13),$$

$$\zeta_1=\frac{2a}{a+a_1}e^{i(a_1x+by+ct)} \quad . \quad . \quad . \quad . \quad . \quad . \quad (14),$$

and so long as a_1 is real they may be interpreted to indicate

$$\zeta=\frac{a-a_1}{a+a_1}\cos(-ax+by+ct) \quad . \quad . \quad . \quad . \quad (15),$$

$$\zeta_1=\frac{2a}{a+a_1}\cos(a_1x+by+ct) \quad . \quad . \quad . \quad . \quad (16),$$

corresponding to the incident wave

$$\zeta=\cos(ax+by+ct) \quad . \quad . \quad . \quad . \quad . \quad . \quad (17).$$

In this case there is a refracted wave of the ordinary kind, conveying away a part of the original energy. When, however, the second medium is the rarer ($V_1>V$), and the angle of incidence exceeds the so-called critical angle [$\sin^{-1}(V/V_1)$], there can be no refracted wave of the ordinary kind. In whatever direction it may be supposed to lie, its trace must necessarily outrun the trace of the incident wave upon the separating surface. The quantity a_1, as defined by our equation, is then imaginary, so that (13) and (14) no longer express the real parts of the symbolical expressions (5) and (6).

If $-ia_1'$ be written in place of a_1, the symbolical equations are

$$\zeta=\frac{a+ia_1'}{a-ia_1'}e^{i(-ax+by+ct)}, \qquad \zeta_1=\frac{2a}{a-ia_1'}e^{i(-ia_1'x+by+ct)};$$

from which, by discarding the imaginary parts, we obtain

$$\zeta=\cos(-ax+by+ct+2\epsilon) \quad . \quad . \quad . \quad . \quad . \quad (18),$$

$$\zeta_1=\frac{2a}{\sqrt{(a^2+a_1^2)}}e^{a_1'x}\cos(by+ct+\epsilon) \quad . \quad . \quad . \quad (19),$$

where

$$\tan\epsilon=a_1'/a \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (20).$$

Since x is supposed to be negative in the second medium, we see that the disturbance is there confined to a small distance (a few wave-lengths) from the surface, and no energy is propagated into the interior. The whole of the energy of the incident waves is to be found in the reflected waves, or the reflection is *total*. There is, however, a change of phase of 2ϵ, given by (20), or in terms of V, V_1, and θ

$$\tan\epsilon=\sqrt{\{\tan^2\theta-\sec^2\theta(V^2/V_1^2)\}} \quad . \quad . \quad . \quad . \quad (21).$$

Fresnel's interpretation.

The principal application of the formulæ being to reflections when the second medium is air, it will be convenient to denote by μ the index of the *first* medium *relatively to the second*, so that $\mu=V_1/V$. Thus

$$\tan\epsilon=\sqrt{\{\tan^2\theta-\sec^2\theta/\mu^2\}} \quad . \quad . \quad . \quad . \quad (22).$$

The above interpretation of his formula $\sin(\theta_1-\theta/\sin(\theta_1+\theta)$, in the case where θ_1 becomes imaginary, is due to the sagacity of Fresnel. His argument was perhaps not set forth with full rigor, but of its substantial validity there can be no question. By a similar process Fresnel deduced from his tangent-formula for the change of phase ($2\epsilon'$) accompanying total reflection when the vibrations are executed in the plane of incidence.

$$\tan\epsilon'=\mu\sqrt{\{\mu^2\tan^2\theta-\sec^2\theta\}} \quad . \quad . \quad . \quad . \quad (23).$$

The phase-differences represented by 2ϵ and $2\epsilon'$ cannot be investigated experimentally, but the *difference* ($2\epsilon'-2\epsilon$) is rendered evident when the incident light is polarized obliquely so as to contribute components in both the principal planes. If in the act of reflection one component is retarded more or less than the other, the resultant light is no longer plane but elliptically polarized.

From (22) and (23) we have

$$\tan(\epsilon' - \epsilon) = \cos\theta \sqrt{\{1 - \mu^{-2}\operatorname{cosec}^2\theta\}},$$

whence

$$\cos(2\epsilon' - 2\epsilon) = \frac{2\mu^2\sin^4\theta - (1+\mu^2)\sin^2\theta + 1}{(1+\mu^2)\sin^2\theta - 1} \quad . \quad . \quad (24).$$

Difference of phases.

The most interesting case occurs when the difference of phase amounts to a quarter of a period, corresponding to light circularly polarized. If, however, we put $\cos(2\epsilon' - 2\epsilon) = 0$, we find

$$4\mu^2\sin^2\theta = 1 + \mu^2 \pm \sqrt{\{(1+\mu^2)^2 - 8\mu^2\}},$$

from which it appears that, in order that sin ^{2} may be real, μ^2 must exceed $3 + \sqrt{8}$. So large a value of μ^2 not being available, the conversion of plane-polarized into circularly-polarized light by one reflection is impracticable.

The desired object may, however, be attained by two successive reflections. The angle of incidence may be so accommodated to the index that the alteration of phase amounts to $\frac{1}{8}$ period, in which case a second reflection under the same conditions will give rise to light circularly polarized. Putting $(2\epsilon - 2\epsilon') = \frac{1}{4}\pi$, we get

$$2\mu^2\sin^4\theta = (1 + \sqrt{\tfrac{1}{2}})\{(1+\mu^2)\sin^2\theta + 1\} \quad . \quad . \quad . \quad (25),$$

an equation by which θ is determined when μ is given.

It appears that, when $\mu = 1.51$, $\theta = 48° 37'$ or $54° 37'$.

Fresnel's rhomb.

These results were verified by Fresnel by means of the rhomb shown in Fig. 27.

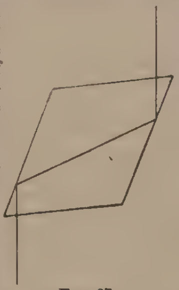

FIG. 27.

Vibrations in the plane of incidence.

The problem of reflection upon the elastic solid theory when the vibrations are executed in the plane of incidence, is more complicated, on account of the tendency to form waves of dilatation. In order to get rid of these, to which no optical phenomena correspond, it is necessary to follow Green in supposing that the velocity of such waves is infinite, or that the media are incompressible.[1] Even then we have to introduce in the neighborhood of the interface waves variously called longitudinal, pressural, or surface waves; otherwise it is impossible to satisfy the conditions of continuity of strain and stress. These waves, analogous in this respect to those occurring in the second medium when total reflection is in progress (19), extend to a depth of a few wave-lengths only, and they are so constituted that there is neither dilatation nor rotation. On account of them the final formulæ are less simple than those of Fresnel. If we suppose the densities to be the same in the two media, there is no correspondence whatever between theory and observation. In this case, as we have seen, vibrations perpendicular to the plane of incidence are reflected according to Fresnel's tangent-formula; and thus vibrations in the plane of incidence should follow the sine-formula. The actual result of theory is, however, quite different. In the case where the relative index does not differ greatly from unity, polarizing angles of 22½° and 67½° are indicated, a result totally at variance with observation. As in the case of diffraction by small particles, an elastic solid theory, in which the densities in various media are supposed to be equal, is inadmissible. If, on the other hand, following Green, we regard the rigidities as equal, we get results in better agreement with observation. To a first approximation indeed (when the refraction is small) Green's formula coincides with Fresnel's tangent-formula; so that light vibrating in the plane of incidence is reflected according to this law, and light vibrating in the perpendicular plane according to the sine-formula. The vibrations are accordingly perpendicular to the plane of polarization.

Green's formula.

The deviations from the tangent-formula, indicated by theory when the refraction is not very small, are of the same general character as those observed by Jamin, but of much larger amount. The minimum reflection at the surface of glass ($\mu = \frac{3}{2}$) would be $\frac{1}{49}$,[2] nearly the half of that which takes place at perpendicular incidence, and very much in excess of the truth. This theory cannot therefore be considered satisfactory as it stands, and various suggestions have been made for its improvement. The only variations from Green's suppositions admissible in strict harmony with an elastic solid theory is to suppose that the transition from one medium to the other is gradual instead of abrupt, that is, that the transitional layer is of thickness comparable with the wave-length. This modification would be of more service to a theory which gave Fresnel's tangent-formula as the result of a sudden transition than to one in which the deviations from that formula are already too great.

Reflection dependent upon discontinuity.

It seems doubtful whether there is much to be gained by further discussion upon this subject, in view of the failure of the elastic solid theory to deal with double refraction. The deviations from Fresnel's formulæ for reflection are comparatively small; and the whole problem of reflection is so much concerned with the condition of things at the interface of two media, of which we know little, that valuable guidance can hardly be expected from this quarter. It is desirable to bear constantly in mind that reflection depends entirely upon an approach to discontinuity in the properties of the medium. If the thickness of the transitional layer amounted to a few wave-lengths, there would be no sensible reflection at all.

Another point may here be mentioned. Our theories of reflection take no account of the fact that one at least of the media is dispersive. The example of a stretched string, executing transverse vibrations, and composed of two parts, one of which in virtue of stiffness possesses in some degree the dispersive property, shows that the boundary conditions upon which reflection depends are thereby modified. We may thus expect a finite reflection at the interface of two media, if the dispersive powers are different, even though the indices be absolutely the same for the waves under consideration, in which case there is no refraction. But a knowledge of the dispersive properties of the media is not sufficient to determine the reflection without recourse to hypothesis.[3]

§ 28. *The Velocity of Light.*

No dispersion *in vacuo.*

According to the principles of the wave theory, the dispersion of refraction can only be explained as due to a variation of velocity with wave-length or period. In aerial vibrations, and in those propagated through an elastic solid, there is no such variation; and so the existence of dispersion was at one time considered to be a serious objection to the wave theory. Dispersion *in vacuo* would indeed present some difficulty, or at least force upon us views which at present seem unlikely as to the constitution of free ether. The weight of the evidence is, however, against the existence of dispersion *in vacuo.* "Were there a difference of one hour in the times of the blue and red rays reaching us from Algol, this star would show a well-marked coloration in its phases of increase and decrease. No trace of coloration having been noticed, the difference of times cannot exceed a fraction of an hour. It is not at all probable that the parallax of this star amounts to one-tenth of a second, so that its distance, probably, exceeds two million radii of the earth's orbit, and the time which is required for its light to reach us probably exceeds thirty years, or a quarter of a million hours. It is therefore difficult to see how there can be a difference as great as four parts in a million between the velocities of light coming from near the two ends of the bright part of the spectrum."[4]

Table of velocities.

For the velocity of light *in vacuo*, as determined in kilometres per second by terrestrial methods (LIGHT, vol. xiv. p. 589), Newcomb gives the following tabular statement:

Michelson, at Naval Academy, in 1879	299,910
Michelson, at Cleveland, 1882	299,853
Newcomb, at Washington, 1882, using only results supposed to be nearly free from constant errors	299,860
Newcomb, including all determinations	299,810

---

[1] The supposition that the velocity is zero, favored by some writers, is inadmissible. Even dilatational waves involve a shearing of the medium, and must therefore be propagated at a finite rate, unless the resistance to compression were *negative.* But in that case the equilibrium would be unstable.

[2] Green's *Papers*, by Ferrers, p. 333.

[3] The reader who desires to pursue this subject may consult Green, "On the Laws of Reflection and Refraction of Light at the Common Surface of Two Non-Crystallized Media," *Camb. Trans.*, 1838 (Green's *Works*, London, 1871, pp. 242, 283); Lorenz, "Ueber die Reflexion des Lichts an der Gränzfläche zweier isotropen, durchsichtigen Mittel," *Pogg. Ann.*, cxi. p. 460 (1860), and "Bestimmung der Schwingungsrichtung des Lichtæthers durch die Reflexion und Brechung des Lichtes," *ibid.*, cxiv. p. 238 (1861); Strutt (Rayleigh), "On the Reflection of Light from Transparent Matter," *Phil. Mag.*, [4] xlii. (1871); Von der Mühll, "Ueber die Reflexion und Brechung des Lichtes an der Grenze unkrystallinischen Medien," *Math. Ann.*, v. 470 (1872), and "Ueber Greens Theorie der Reflexion und Brechung des Lichtes," *Math. Ann.*, xxvii. 506 (1886); Thomson *Baltimore Lectures*; Glazebrook, "Report on Optical Theories," *Brit. Ass. Rep.*, 1886; Rayleigh, "On Reflection of Vibrations at the Confines of Two Media between which the Transition is gradual," *Proc. Math. Soc.*, xi.; and Walker, "An Account of Cauchy's Theory of Reflection and Refraction of Light," *Phil. Mag.*, 151 (1887). References to recent German writers, Ketteler, Lommel, Voigt, etc., will be found in Glazebrook's Report.

[4] Newcomb, *Astron. Papers*, vol. ii. parts iii. and iv., Washington, 1885.

To these may be added, for reference—

Foucault, at Paris, in 1862	298,000
Cornu, at Paris, in 1874	298,500
Cornu, at Paris, in 1878	300,400
This last result, as discussed by Listing	299,990
Young and Forbes, 1880–1881	301,382

Newcomb concludes, as the most probable result—

Velocity of light *in vacuo* = 299,860 ± 30 kilometres.

It should be mentioned that Young and Forbes inferred from their observations a difference of velocities of blue and red light amounting to about 2 per cent., but that neither Michelson nor Newcomb, using Foucault's method, could detect any trace of such a difference.

When we come to consider the propagation of light through ponderable media, there seems to be little reason for expecting to find the velocity independent of wave-length. The interaction of matter and ether may well give rise to such a degree of complication that the differential equation expressing the vibrations shall contain more than one constant. The law of constant velocity is a special property of certain very simple media. Even in the case of a stretched string, vibrating transversely, the velocity becomes a function of wave-length as soon as we admit the existence of finite stiffness.

Formulæ for dispersion.

As regards the law of dispersion, a formula, derived by Cauchy from theoretical considerations, was at one time generally accepted. According to this,

$$\mu = A + B\lambda^{-2} + C\lambda^{-4} + \quad . \quad . \quad . \quad . \quad (1);$$

and there is no doubt that even the first two terms give a good representation of the truth in media not very dispersive, and over the more luminous portions of the spectrum. A formula of this kind treats dispersion as due to the smallness of wave-lengths, giving a definite limit to refraction (A) when the wave-length is very large. Recent investigations by Langley on the law of dispersion for rock-salt in the ultra red region of the spectrum are not very favorable to this idea. The phenomena of abnormal dispersion indicate a close connection between refraction and absorption, and Helmholtz has formulated a general theory of dispersion based upon the hypothesis that it may be connected with an absorbing influence operative upon invisible portions of the spectrum. Upon this subject, which is as yet little understood, the reader may consult Glazebrook's "Report on Optical Theories."[1]

Michelson's researches.

The limits of this article do not permit the consideration of the more speculative parts of our subject. We will conclude by calling attention to two recent experimental researches by Michelson, the results of which cannot fail to give valuable guidance to optical theorists. The first of these[2] was a repetition under improved conditions of a remarkable experiment of Fizeau, by which it is proved that when light is propagated through water, itself in rapid movement in the direction of the ray, the velocity is indeed influenced, but not to the full extent of the velocity of the water (v). Within the limits of experimental error, the velocity agrees with a formula suggested by Fizeau on the basis of certain views of Fresnel, viz.,

$$V = V_0 \pm \frac{\mu^2 - 1}{\mu^2} v \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (2),$$

V_0 being the velocity when the medium is stationary. In the case of water $(\mu^2 - 1)^2\mu^2 = .437$. Conformably with (2), a similar experiment upon air, moving at a velocity of 25 metres per second, gave no distinct effect.

From the result of the experiments upon water we should be tempted to infer that at the surface of the earth, moving through space, the ether still retains what must be coarsely called relative motion. Nevertheless, the second research above alluded to[3] appears to negative this conclusion, and to prove that, at any rate within the walls of a building, the ether must be regarded as fully partaking in the motion of material bodies. (R.)

WAX is a solid fatty substance of animal and vegetable origin, allied both in sources and constitution to the fixed oils and fats. From fats or solid oils wax differs principally in its greater hardness and higher melting-point; but in the strictly chemical sense, while oils and fats are glycerides, a true wax contains no glycerin, but is a combination of fatty acids with certain solid monatomic alcohols. Of wax from animal sources there are in commerce beeswax, which forms wax *par excellence*, Chinese insect wax, and spermaceti. The more important vegetable waxes are Japanese wax, myrtle-berry wax, carnauba wax, and palm wax.

Beeswax is secreted by all honey bees, and by them formed into the cell walls, etc., of their comb. It is separated by draining the honey, melting the drained comb in boiling water, and collecting the wax which solidifies on the top as the water cools. In this state it is formed into cakes of raw or yellow wax, good examples of which are of a light yellow color, translucent, with a faint pleasant odor of honey. At ordinary temperatures it breaks with a granular fracture; and in thin flakes or pellets it softens with the heat of the hand, and can be kneaded between the fingers. Its specific gravity is 0.960; it melts at about 62° C., and solidifies just under its melting-point without evolution of heat. It is soluble in hot ether, essential and fixed oils, benzol, bisulphide of carbon, and chloroform, and to some extent in boiling alcohol, but it is unaffected by water and cold alcohol. In chemical constitution it contains 10 per cent. of cerin, an ether of cerotic acid and ceryl alcohol, $\left.\begin{matrix} C_{27}H_{53}O \\ C_{27}H_{55} \end{matrix}\right\} O$, and 90 per cent. of myricin—ether of palmitic acid and myricyl alcohol, $\left.\begin{matrix} C_{16}H_{31}O \\ C_{30}H_{61} \end{matrix}\right\} O$. Yellow wax, on account of the coloring matter and other contaminations it contains, is unfit for many uses. The chief of these is candle-making. To remove soluble matter it is first melted over boiling water; and for bleaching it is formed into thin shreds and strips so as to expose the greatest possible surface. So prepared, it is spread out and frequently watered and turned in the direct sunlight, a slow but effective process. To hasten the bleaching action the wax may be mixed with about one-sixth of pure spirit of turpentine; and this preparation, on exposure, by its copious production of ozone, effects in four or five days a bleaching which otherwise would occupy three or four weeks. When the bleaching is complete all trace of turpentine oil will have disappeared. Bleaching may also be effected by chlorine, permanganate of potash, and other chemicals, but these injuriously affect the wax, in some cases forming substitution products which cannot be removed, and which in burning give off deleterious fumes. Wax is obtained in all parts of the world where there is vegetation sufficient to support bees; but it is most largely forthcoming from tropical and subtropical regions. It is subject to extensive adulteration from powdered mineral substances, flour, cheaper waxes, paraffin, etc. Its uses are multifarious; but it is most largely consumed in making candles for the religious services of Roman Catholic and Orthodox Greek Christians, and for wax figures and models (see WAX FIGURES).

Chinese Insect Wax, or *Pe La*, is a secretion deposited by an insect, *Coccus ceriferus*, Fabr., in the twigs of a species of ash, *Fraxinus chinensis*, Roxb. The wax is, in its origin and the functions it performs in the insect economy, closely related to the lac produced by the allied species of *Coccus* (see LAC, vol. xiv. p. 182). When separated from the twigs which it encrusts, and purified, it is a hard translucent white crystalline body, similar to spermaceti. It melts at from 82° to 86° C., and in composition consists of cerin, one of the constituents of beeswax. It is little known in European commerce, but forms a highly important article of trade in China and Japan, where it is largely used for candle-making and for medicinal purposes.

Japanese Wax is a hard wax-like fat which now forms an important export from Japan, principally to London. It is obtained from the small stone fruits of several species of *Rhus* cultivated in Japan. For the extraction of the wax, which is present to the extent of about 20 per cent., the fruits are ground and treated by either of three methods: (1) heating and pressure, (2) boiling in water, and (3) maceration with ether or bisulphide of carbon. The wax is subsequently bleached, and as it comes into the market consists of yellowish hard cakes, covered often with a fine white powdery efflorescence. It has a resinous unpleasant rancid odor. It melts at about 54° C., and solidifies from melting at 41° C. with evolution of heat which raises the temperature about 5° C. Japanese wax becomes translucent about 12° C. under its melting-point, and when it has newly solidified from melting it can again be liquefied at 42° C., from which the melting-point rises by slow degrees with the lapse of time till it reaches the normal. It is not a true wax, but consists principally of the glyceride palmitin with small proportions of stearin and disseminated crystals of free palmitic acid. It is largely mixed with and used as a substitute for beeswax, excepting for uses where its rancidity renders it objectionable.

Myrtle-Berry Wax is obtained from the fruit of several species of *Myrica* in the United States, New Granada, Venezuela, the Cape of Good Hope and other regions. It is a hard greenish substance, with a pleasant balsamic odor. Its melting-point is about 45° C., and it consists principally of free palmitic acid with a little stearic acid and myristic acid,—a very small proportion of these being combined as glycerides. It is consumed principally in the United States in combination with beeswax for candles; and it is said the Hottentots eat it like cheese.

Carnauba Wax is an exudation on the surface of the growing leaves of the carnauba palm, *Corypha cerifera*, L., which flourishes in tropical South America. The wax is obtained by cutting off and drying the young leaves, from which it is then shaken as fine dust, and caked by melting either over an open fire or in boiling water. It is a true wax, consisting of ethers of myricyl alcohol and ceryl alcohol with cerotic acid, and its melting-point ranges from 85° to 90° C. Carnauba wax is a substance of considerable commercial importance in Brazil, whence large quantities are sent to Europe for use in the candle-trade and otherwise as a substitute for beeswax.

Palm-Tree Wax is an exudation formed on the stems of two South American palms, *Ceroxylon andicola*, H. and K., and *Klopstockia cerifera*, Kars. As scraped from the trees and compacted by melting it is a mixture of resin and wax, having a melting-point as high as 102° to 105° C. The pure wax may be separated by digesting with boiling spirit when it is obtained with a melting-point of 72° C. and a composition analogous to carnauba wax, like which it is used for candles. Palm-tree wax is little seen in European commerce.

For the compound called SEALING WAX, see vol. xxi. p. 613.

WAX FIGURES. Beeswax is possessed of properties which render it a most convenient medium for preparing figures and models, either by modelling or by casting in moulds. At ordinary temperatures it can be cut and shaped with facility; it melts to a limpid fluid at a low heat; it mixes with any coloring matter, and takes surface tints well; and its texture and consistency may be modified by the addition of earthy matters and oils or fats. When molten, it takes the minutest impressions of a mould, and it sets and hardens at such a temperature that no ordinary climatic influences affect the form it assumes, even when it is cast in thin laminæ. The facilities which wax offers for modelling have been taken advantage of from the remotest times. Figures in wax of their deities were used in the funeral rites of the ancient Egyptians, and deposited among other offerings in their graves; many of these are now preserved in museums. That the Egyptians also modelled fruits can be learned from numerous allusions in early literature. Among the Greeks during their best art period, wax figures were largely used as dolls for children; statuettes of deities were modelled for votive offerings and for religious ceremonies, and wax images to which magical properties were attributed were treasured by the people. Wax figures and models held a still more important place among the ancient Romans. The masks (*effigies* or *imagines*) of ancestors, modelled in wax, were preserved by patrician families, this *jus imaginum* being one of the privileges of the nobles, and these masks were exposed to view on ceremonial occasions, and carried in their funeral processions. The closing days of the Saturnalia were known as *Sigillaria* on account of the custom of making, towards the end of the festival, presents of wax models of fruits and waxen statuettes which were fashioned by the *Sigillarii* or manufacturers of small figures in wax and other media. The practice of wax modelling can be traced through the Middle Ages, when votive offerings of wax figures were made to churches, and the memory and lineaments of monarchs and great personages were preserved by means of wax masks, as in the days of Roman patricians. In these ages malice and superstition found expression in the formation of wax images of hated persons, into the bodies of which long pins were thrust, in the confident expectation that thereby deadly injury would be induced to the person represented; and this belief and practice continued till the 17th century. Indeed the superstition still holds a place in the Highlands of Scotland, where within the last few years a clay model of an enemy was found in a stream, having been placed there in the belief that, as the clay was washed away, so would the health of the hated one decline. With the renaissance of art in Italy, modelling in wax took a position of high importance, and it was practiced by some of the greatest of the early masters. The bronze medallions of Pisano and the other famous medallists owe their value to the art qualities of wax models from which they were cast by the *cire perdue* process; and indeed all early bronzes and metal work were cast from wax models. The *Tête de cire* in the Wicar collection at Lille, the work of a Florentine artist of the 15th century, is one of the most lovely creations of that fertile era. From that period till towards the close of the 18th century modelling of medallion portraits and of relief groups, the latter frequently polychromatic, was in considerable vogue throughout Europe. About the end of the 18th century Flaxman executed in wax many portraits and other relief figures which Josiah Wedgwood translated into pottery for his jasper ware. The modelling of the soft parts of dissections, etc., for teaching illustrations of anatomy was first practiced at Florence, and is now very common. Such preparations formed part of a show at Hamburg in 1721, and from that time wax-works, on a plane lower than art, have been popular attractions. These exhibitions consist principally of images of historical or notorious personages, made up of waxen masks on lay figures in which sometimes mechanism is fitted to give motion to the figure. Such an exhibition of wax-works with mechanical motions was shown in Germany early in the 18th century, and is described by Steele in the *Tatler*. The most famous modern wax-work exhibition is that of Madame Tussaud in London. This collection was originated in Paris, during the Revolution by that lady, who, having modelled Charlotte Corday, Marat, and other well-known persons of that bloody period, settled in London with her collection early in the present century.

WAXWING, a bird first so-called apparently by Selby in 1825 (*Illustr. Brit. Ornithology*, p. 87), having been before known as the "Silk-tail" (*Philos. Transactions*, 1685, p. 1161)—a literal rendering of the German *Seidenschwanz*—or "Chatterer"—the prefix "German," "Bohemian," or "Waxen" being often also applied. Selby's convenient name has now been generally adopted, since the bird is readily distinguished from almost all others by the curious expansion of the shaft of some of its wing feathers at the tip into a flake that looks like scarlet sealing-wax, while its exceedingly silent habit makes the name "Chatterer" wholly inappropriate, and indeed this last arose from a misinterpretation of the specific term *garrulus*, meaning a Jay (from the general resemblance in color of the two birds), and not referring to any garrulous quality. It is the *Ampelis garrulus* of Linnæus and of more recent ornithologists.[1]

The Waxwing is a bird that for many years excited vast interest. An irregular winter-visitant, sometimes in countless hordes, to the whole of the central and some parts of southern Europe, it was of old time looked upon as the harbinger of war, plague, or death, and, while its harmonious coloration and the grace of its form were attractive, the curiosity with which its irregular appearances were regarded was enhanced by the mystery which enshrouded its birthplace, and until the summer of 1856 defied the searching of any explorer. In that year, however, all doubt was dispelled, through the successful search in Lapland, organized by the late John Wolley, as briefly described by him to the Zoological Society (*Proceedings*, 1857, pp. 55, 56, pl. cxxii.).[2] In 1858 Mr. Dresser found a small settlement of the species on an island in the Baltic near Uleåborg, and with his own hands took a nest. It is now pretty evident that the waxwing, though doubtless breeding yearly in some parts of northern Europe, is as irregular in the choice of its summer-quarters as in that of its winter-retreats. Moreover, the species exhibits the same irregular habits in America. Mr. Drexler on one occasion, in Nebraska, saw it in "millions." In 1861 Kennicott found it breeding on the Yukon, and later Mr. MacFarlane had the like good fortune on the Anderson River.

Beautiful as is the bird with its drooping crest, its cinnamon-brown plumage passing in parts into gray or chestnut, and relieved by black, white and yellow—all of the purest tint—the external feature which has invited most attention is the "sealing-wax" (already mentioned) which tips some of the secondary or radial quills, and occasionally those of the tail.[3] This is nearly as much exhibited by the kindred species, *A. cedrorum*—the well-known Cedar-bird of the English in North America—which is easily distinguished by its smaller size, less black chin-spot, the yellower tinge of the lower parts, and the want of white on the wings. In the *A. phœnicopterus* of southeastern Siberia and Japan, the remiges and rectrices are tipped with red in the ordinary way without dilatation of the shaft of the feathers.

Both the Waxwing and Cedar-bird seem to live chiefly on insects in summer, but are marvellously addicted to berries during the rest of the year, and will gorge themselves if opportunity allow. Hence they are not pleasant cage-birds, though quickly becoming tame. The erratic habits of the Waxwing are probably due chiefly to the supplies of food it may require, prompted also by the number of mouths to be fed, for there is some reason to think that this varies greatly from one year to another, according to season. The flocks which visit Britain and other countries outside the breeding range of the species naturally contain a very large proportion of young birds.

The systematic position of the genus *Ampelis* is very doubtful. It can hardly be said to have any near ally, for neither of the Neotropical and Antillean genera, ***Ptilogonys*** and ***Myiodectes*** (often erroneously spelt ***Myiadestes***), can as yet be safely declared of kin to it, as has been alleged. (A. N.)

WEALTH. The most commonly accepted definition of wealth is that it consists of all useful and agreeable things which possess exchange value, and this again is generally regarded as coextensive with all desirable things except those which do not involve labor or sacrifice for their acquisition in the quantity desired. On analysis it will be evident that this definition implies, directly, preliminary conceptions of utility and value, and, indirectly, of sacrifice and labor, and these terms, familiar though they may appear, are by no means simple and obvious in their meaning. Utility, for the purposes of economic reasoning, is usually held to mean the capacity to satisfy a desire or serve a purpose (J. S. Mill), and in this sense is clearly a much wider term than wealth. Sunshine and fresh air, good temper and pleasant manners, and all the infinite variety of means of gratification, material and immaterial, are covered by utility as thus defined. Wealth is thus a species of utility, and in order to separate it from other species some *differentia* must be found. This, according to the general definition, is exchange value, but a little reflection will show that in some cases it is necessary rather to contrast value with wealth. "Value," says Ricardo, expanding a thought of Adam Smith, "essentially differs from riches, for value depends not on abundance but on the difficulty or facility of production." According to the well-known tables ascribed to Gregory King, a deficiency of a small amount in the annual supply of corn will raise its value far more than in proportion, but it would be paradoxical to argue that this rise in value indicated an increase in an important item of national wealth. Again, as the mines of a country are exhausted and its natural resources otherwise impaired, a rise in the value of the remainder may take place, and as the free gifts of nature are appropriated they become valuable for exchange, but the country can hardly be said to be so much the wealthier in consequence. And these difficulties are rather increased than diminished if we substitute for value the more familiar concrete term "money-price."—for the contrast between the quantity of wealth and its nominal value becomes more sharply marked. Suppose, for example, that in the total money value of the national inventory a decline were observed to be in progress, whilst at the same time, as is quite possible, an increase was noticed in the quantity of all the important items and an improvement in their quality, it would be in accordance with common-sense to say that the wealth of the country was increasing and not decreasing.

So great are these difficulties that some economists (*e.g.*, Ricardo) have proposed to take utility as the direct measure of wealth, and, as Mr. Sidgwick has pointed out, if double the quantity meant double the utility this would be an easy and natural procedure. But even to the same individual the increase in utility is by no means simply proportioned to the increase in quantity, and the utility of different commodities to different individuals, and *a fortiori* of different amounts, is proverbial. The very same things may to the same individual be productive of more utility simply owing to a change in his tastes or habits, and a different distribution of the very same things which make up the wealth of a nation, might indefinitely change the quantity of utility, but it would be paradoxical to say that the wealth had increased because it was put to better uses.

We thus seem thrown back on value as the essential characteristic, allowance being made for any change in the standard of value; but there are still difficulties to be overcome. Some things that undoubtedly possess value or that can command a price are immaterial, *e.g.*, the advice of a lawyer or physician or the song of a *prima donna*, and, although perhaps the skill of a workman (in any grade of the social scale) might be considered as attached to the man, as a coal mine is attached to a place, it is more in accordance with popular usage to consider skill as immaterial, whilst at the same time it seems equally natural *prima facie* to confine the term wealth to material things in the common sense. Again, the credit system of a country is a product of great labor and sacrifice, it is most closely connected with the production of its material wealth in the narrowest sense, and it certainly commands a pecuniary value, and yet credit is more generally held to be a representative rather than a part of wealth, owing apparently to its insubstantial character. Apart from the question of materiality some writers have insisted on relative permanence and possibility of accumulation as essential attributes of wealth, and have thus still further narrowed the scope of the definition.

---

[1] Some writers, ignoring historical facts, have taken a South American form (now known to belong to a wholly distinct Suborder of Birds) as the "type" of the Linnæan genus *Ampelis*. Linnæus had, as is well known, no conception of what is meant by the modern idea of a "type;" but none can doubt that, if such a notion had been entertained by him, he would have declared his type-species to be that to which the name was first applied, viz., the present, and hence those systematists are wrong who would remove this to a genus variously called *Bombycilla*, *Bombiciphora*, or, most absurd of all, *Bombicivora*. The birds which ought to be removed from *Ampelis* are those which are now generally recognized as forming a Family, *Cotingidæ*, allied to the *Pipridæ* (*cf.* MANAKIN), and like them peculiar to the Neotropical Region, in the fauna of which they constitute, according to the investigations of Garrod and Forbes (ORNITHOLOGY, vol. xviii. p. 51), the natural group *Oligomyodæ*.

[2] A fuller account of his discovery, illustrated by Hewitson, is given in the *The Ibis* (1861, pp. 92-106, pl. iv.).

[3] The structure of these appendages has been carefully described by Herr Andersen (*Öfvers. K. Vet.-Ak. Förhandlingar*, 1859, pp. 219-231, pl. ii.). Their development seems chiefly due to age, though, as Wolley showed, they are perceptible in the nestling plumage. Mr. Turner states (*Contr. Nat. Hist. Alaska*, p. 177) that the Eskimo name of the Waxwing means a "killer of small birds," these appendages being held to be the "clotted blood of its victims:"

There can be no doubt that it is on many grounds desirable in economics to use terms as far as possible in their popular acceptations; but this rule must always be subordinate to the primary object in view. In nearly every department of knowledge in which popular terms have been retained it has been found necessary either constantly to use qualifying adjectives where the context is not a sufficient guide, and in some cases, when analysis discloses very different elements, to make a selection. Sometimes it has been found convenient to use a term with some variation in the definition according to the branch of the subject in hand.[1] Applying these rules to the definition of wealth, perhaps the best solution is that which is generally connected with German economists (*e.g.*, Held). Wealth consists of utilities, and in the first great department of economics—the *consumption* of wealth—it is utility with which we are principally concerned,—the idea of value, for example, being overshadowed. The most general law of the consumption of wealth is that successive portions of any stock give a diminishing amount of utility when consumed. Then in the department of the *production* of wealth the most important characteristics are the labor and sacrifice necessary to put the utilities desired into the things and to place the things where they are wanted. The idea of value is again secondary and subordinate. We can readily see the part played by nature, labor, and capital respectively in the production of any commodity without considering the *effects* on its value of the various factors; we can understand the principles of division of labor and of the relative productiveness of large and small industries without entering into questions of value except in the most general manner. In the department of the *distribution* of wealth the fundamental conception is the right of appropriation; and accordingly J. S. Mill very properly commences this part of his subject by an account of the relative advantages of the socialistic and individual systems of property. It is quite possible under the former to conceive of all the distribution being made without any exchange and with reference simply to the wants or the deserts of the members of the society. Thus it is not until we arrive at the department of the *exchange* of wealth that the characteristic of value becomes predominant, although of course value is closely connected with utility and labor and sacrifice.

Usually, however, it will be found that in most cases anything which can fairly be classed as wealth in one department is also wealth in the others, and thus the definition is reached that wealth in general consists of all "consumable utilities which require labor for their production and can be appropriated and exchanged." It only remains to add that "utilities" may be divided into "inner" and "outer" (to translate the German literally),—the "inner" being such as are simply sources of personal gratification to their possessor, *e.g.*, a good ear for music: the "outer" utilities again may be divided into "free" and "economic" the former, as a rule, *e.g.*, sunlight, not being the result of labor and not capable of appropriation or exchange, and the latter as a rule possessing each of these marks. It is these "economic utilities" which constitute wealth in the specific sense of the term, although its use may be extended by analogy to include almost all utilities. (J. S. N†.)

WEASEL. The smallest species of the group of animals of which the polecat and stoat are well-known members (see MAMMALIA, vol. xv. pp. 446–7). It is *Mustela vulgaris* of Linnæus, but belongs to the section (*Putorius*) of the genus which has but three premolar teeth on each side above and below, instead of four as in the martens (to which *Mustela* is commonly restricted) and hence is now called *Putorius vulgaris*. The dentition is $i\,\frac{3}{3}$, $c\,\frac{1}{1}$, $p\,\frac{3}{3}$, $m\,\frac{1}{2} = \frac{8}{9}$; total 34.

The weasel is an extremely elegant little animal, with elongated slender body, the back generally much arched, the head small and flattened, ears short and rounded, neck long and flexible, limbs very short, five toes on each foot, all with sharp, compressed, curved claws, tail rather short, slender, cylindrical, and pointed at the tip, fur short and close. The upper parts outside of limbs and tail, are a uniform reddish-brown, the under parts pure white. In very cold regions, both in Europe and America, it turns completely white in winter, but less regularly and at a lower temperature than its near ally the stoat or ermine, from which it is easily distinguished by its smaller size, and by its wanting the black end of the tail. The length of the head and body of the male is usually about 8 inches, that of the tail 2½ inches; the female is smaller. The common weasel is pretty generally distributed throughout Europe, Northern and Central Asia, British North America, and the northern portions of the United States. It possesses in a full degree all the active, courageous, and bloodthirsty disposition of the rest of the genus, but its diminutive size prevents its attacking and destroying any but the smaller mammals and birds. Mice, rats, voles, and moles, as well as frogs, constitute its principal food. It is generally found on or near the surface of the ground, but it can not only pursue its prey through very small holes and crevices of rocks and under dense tangled herbage, but follow it up the stems and branches of trees, or even into the water, swimming with perfect ease.

Weasel.

It constructs a nest of dried leaves and herbage, placed in a hole in the ground or a bank or hollow tree, in which it brings up its litter of four to six (usually five) young ones. The mother will defend her young with the utmost desperation against any assailant, having been often known to sacrifice her own life rather than desert them.

---

[1] On the uses and difficulties of definitions in political economy compare Mr. Sidgwick's *Principles*, bk. i. ch. ii., and Cairnes's *Logical Method of Political Economy*.

WEAVER-BIRD, the name[1] by which a group of between 200 and 300 species are now usually called, from the elaborately interwoven nests that many of them build, some of the structures being of the most marvellous kind. By the older systematists such of these birds as were then known were distributed among the genera *Oriolus*, *Loxia*, *Emberiza*, and *Fringilla*; and it was Cuvier who in 1817 first brought together these dissevered forms, comprising them in a genus *Ploceus*. Since his time others have been referred to its neighborhood, and especially the genus *Vidua* with its allies, so as to make of them a Subfamily *Ploceinæ*, which in 1847 was raised by Prof. Cabanis to the rank of a Family *Ploceidæ*,—a step the propriety of which has since been generally admitted, though the grounds for taking it—far too technical to be here criticised—are very slight, and such as could not be held valid in any other Order than that of *Passeres*.

Where so many forms are concerned, only a few of the most important can now be mentioned. The type of Cuvier's genus is certainly the *Loxia philippina* of Linnæus, so termed from the islands it inhabits. But the typical Weaver-bird of Latham (not that he had the name in that precise form) is the *Hyphantornis cucullata* or *textor* of modern writers, an African species, and it is to the Ethiopian Region that by far the greatest number of these birds belong, and in it they seem to attain their maximum of development. They are all small, with, generally speaking, a Sparrow-like build; but in richness of coloring the males of some are very conspicuous—glowing in crimson, scarlet or golden-yellow, set off by jet-black, while the females are usually dull in hue. Some species build nests that are not very remarkable, except in being almost invariably domed—others (such as the Philippine Weaver-bird, *Ploceus philippinus*, just named) fabricate singular structures[2] of closely and uniformly interwoven tendrils or fine roots, that often hang from the bough of a tree over water, and, starting with a solidly wrought rope, open out into a globular chamber, and then contract into a tube several inches in length, through which the birds effect their exit and entrance. But the most wonderful nests of all, and indeed the most wonderful built by birds, are those of the so-called Sociable Grosbeak, *Philhetærus socius*, of Africa. These are composed wholly of grass, and are joined together to the number of 100 or 200—indeed 320 are said to have been found in one of these aggregated masses, which usually take the form of a gigantic mushroom,[3] affording a home and nursery to many pairs of the birds which have been at the trouble of building it. These nests, however, have been so often described and figured by South-African travellers that there is no need here to dilate longer on their marvels. It may be added that this species of Weaver-bird, known to French writers as the *Républicain*, is of exceptionally dull plumage.

The group of Widow-birds,[4] *Viduinæ*, is remarkable for the extraordinary growth of the tail-feathers in the males at the breeding-season. In the largest species, *Vidua* (sometimes called *Chera*) *progne*, the cock-bird, which, with the exception of a scarlet and buff bar on the upper wing-coverts, is wholly black, there is simply a great elongation of the rectrices; but in *V. paradisea* the form of the tail is quite unique. The middle pair of feathers have the webs greatly widened, and through the twisting of the shafts their inferior surfaces are vertically opposed. These feathers are comparatively short, and end in a hair-like filament. The next pair are produced to the length of about a foot—the bird not being so big as a sparrow—and droop gracefully in the form of a sickle. But this is not all: each has attached to its base a hair-like filament of the same length as the feather, and this filament originally adhered to and ran along the margin of the outer web, only becoming detached when the feather is full grown.[5] In another species, *V. principalis*, the two middle pairs of rectrices are equally elongated, but their webs are convex, and the outer pair contains the inner, so that when the margins of the two pairs are applied a sort of cylinder is formed.[6] The females of all the Widow-birds differ greatly in appearance from the males, and are generally clothed in a plumage of mottled brown.

Usually classed with the Weaver-birds is a vast group of small seed-eating forms, often called *Spermestinæ*, but for which *Estreldinæ* would seem to be a more fitting name. These comprehend the numerous species so commonly seen in cages, and known as Amadavats, *Estrelda amandava*, Nutmeg-birds, *Munia punctularia*, Waxbills, *Pytelia melba* and *phœnicoptera*, Cut-throats, *Amadina fasciata*, the Java Sparrow, *Padda oryzivora*, and many more than we can name. Many of these genera are common to Africa and India, and some also to Australia, but the last has several genera peculiar to itself, such as *Donacicola* and *Poophila*, there known as Grass-finches. The true affinity of these seems to require further investigation.[7]

(A. N.)

WEAVING is the art of forming cloth by the interlacing of yarn or other filaments in a loom. In weaving two kinds or sets of yarn are used, the warp and the weft. The warp consists of the threads of yarn which extend generally but not always in parallel lines from end to end the whole length of the web; the weft yarn crosses and intersects the warp at right angles and fills up the breadth of the web. The warp is mounted on the loom for weaving, and into it the weft is thrown by means of a shuttle. Weaving is thus distinct from knitting, netting, looping, and plaiting, by all of which methods cloth may be made from yarns. Cloth also is prepared by felting, but in that operation the fibres are simply matted together without either spinning or intertwisting.

To appearance the varieties of woven cloth are endless; but these differences are only in part due to the method of weaving. The textile materials employed, the methods used in spinning and preparing yarns, the dye colors resorted to, and the finishing processes may vary indefinitely and so contribute to give variety of character to the resultant product. The complexities of the art of weaving itself are reducible to a few fundamental operations, which do not of necessity demand the most intricate mechanism. The gorgeous mediæval textiles of which numerous examples remain, were made in looms of primitive construction. For producing the Indian muslins of the present day with their marvellous delicacy of texture, and for the elaborate and sumptuous shawls of Kashmir, the weavers have only rude and simple looms. But patient and tedious handiwork in these instances is devoted to produce effects which, with the application of modern machinery, can be automatically secured with as great rapidity as in the case of the plainest fabric.

The series of inventions which have led up to the marvellously ingenious looms of the present day began with the invention of the fly shuttle, so called because of the rapidity of its motion, by John Kay of Bury in 1733. Previous to Kay's time the shuttle was thrown by the weaver's hand across and through the warp threads from side to side of the web. His invention brought the plain hand-loom practically into the form in which it continues at present; and, as it forms the basis of all modern machinery, a description of its parts and working, and of the operations connected with plain weaving, may here be given. In accordance with the definition already laid down, plain cloth, such as an ordinary piece of calico or linen, will, on examination, be found to consist of two sets of threads, the one intersecting the other at right angles, with each single thread passing alternately over one and under the next. Such a web is produced by passing the weft thread over and under each alternate warp thread in the breadth of the loom, the warp threads under one shot of weft being above the next. To do this, and to beat or close up each successive weft thread so as to make an even and sufficiently close cloth, necessitates a series of operations of which the following is an outline.

---

[1] First bestowed in this form apparently by Stephens in 1826 (*Gen. Zoology*, xiv. pt. i. p. 34); but in 1782 Latham (*Synopsis*, i. p. 435) had called the "*Troupiale du Sénégal*" of Buffon the "Weever Oriole," from its habit of entwining the wires of the cage in which it was kept with such vegetable fibres as it could get, and hence in 1788 Gmelin named it *Oriolus textor*. In 1800 Daudin used the term "*Tisserin*" for several species of the Linnæan genus *Loxia*, and this was adopted some years later by Cuvier as the equivalent of his *Ploceus*, as mentioned in the text.

[2] These differ from those built by some of the ORIOLES (*q.v.*) and other birds, whose nests may be compared to pensile pockets, while those of these Weaver-birds can best be likened to a stocking hung up by the "toe" with the "heel" enlarged to receive the eggs while access and exit are obtained through the "leg."

[3] But at a distance they may often be mistaken for a native hut with its grass-roof.

[4] It has been ingeniously suggested that this name should be more correctly written Whydah bird—from the place on the West Coast of Africa so named; but Edwards, who in 1745 figured one of the species, states that he was informed that "the Portuguese call this bird the Widow, from its Colour and long Train." (*Nat. His. Birds*, i. p. 86.)

[5] This curious structure was long ago described by Brisson (*Ornithologie*, iii. p. 123), and more recently by Strickland (*Contr. Ornithologie*, 1850, pp. 88 and 149, pl. 59).

[6] Both these species seem to have been first described and figured in 1600 by Aldrovandus (lib. xv. cap. 22, 23) from pictures sent to him by Ferdinando de' Medici, duke of Tuscany.

[7] An illustrated *Monograph of the Weaver-Birds* by Mr. Edward Bartlett is now in course of publication.

Warping.—The number of longitudinal threads which go to form the web will vary, of course, according to its breadth and to the closeness with which they lie together; for fine webs several thousand warp threads, of sufficient length to form a web of many yards, may have to be laid parallel to each other. This is done in the warping frame, which consists of a large reel, set vertically, on which separate threads drawn from a range of bobbins are wound together in a spiral manner to the required length of the web. The yarns coming from the bobbins are brought together in a heck, which is made to slide up and down a guide post as the reel or warping frame revolves, and thus it delivers to the reel a band of thread which winds up and down the reel spirally by the rise and fall of the heck. Supposing 100 "ends" or warp threads are being reeled from bobbins and 1000 ends of warp are required in the web, then the full lengths wound on the reel must be repeated upward and downward ten times. At each end of the warp the threads are, by a mechanical device in the heck, made to intersect alternately, forming leashes which are, when taken from the reel, separately tied up, and thus aid in maintaining the parallelism of the ends when they are bundled up. Such a bundle of warp when required for weaving is taken in hand by the beamer, whose duty is to spread the threads evenly and wind them on the warp beam, spreading the ends in the order in which they are to appear in the woven fabric, and giving them about the breadth of the web. Cotton warps are wound direct from the bobbins on the beam, there being a mechanical arrangement in the warping machine which stops its motion when any thread breaks, or when a bobbin is exhausted. The contents of several beams filled from bobbins may be required to be rewound together on a single beam to supply the requisite quantity of ends for a web.

Plain Weaving.—The warp beam thus filled is laid in the loom (Fig. 1), and the ends of warp are then separately drafted or drawn through a pair of heddles or healds. The essential features of the heddle are the eyes, loops, or mails through which the warp is threaded, one end of warp only passing through any mail. This eye or mail is placed in the heddle half-way between an upper and a lower wooden sheaf, over which pass the heald threads or between which extend the wires on which such mails are supported. The distance between the mails and the lathes at each end must be sufficient to allow of that opening or "shedding" of the warp which it is the function of the heddle to secure. Through the mails of one heddle each alternate end of warp is drafted, and the remaining ends are passed similarly through the other. Thus each heddle receives every alternate thread across the whole breadth of the warp. From the heddles the ends are carried through the reed (Fig. 2), which is the ultimate distributor of the warp, and the instrument by which the weft is beaten up and closed in weaving. It consists of an oblong narrow frame filled with fine strips of cane or of flattened brass or steel wire, these strips being placed in fine comb-like order more or less closely together, up to as many as 120 strips or "dents," or even more, per inch; two or more ends are passed through each slit of the reed, which is fixed in a "lay" or "batten," a suspended frame for moving the reed backward and forward in beating up the weft. On the lower part of the batten a ledge projects, which forms the "shuttle race" for carrying the shuttle in "picking" from and to the shuttle boxes at each end of the lay. From the reed the ends are carried forward and fastened to the cloth beam, and now the warp is ready for the weaving operation.

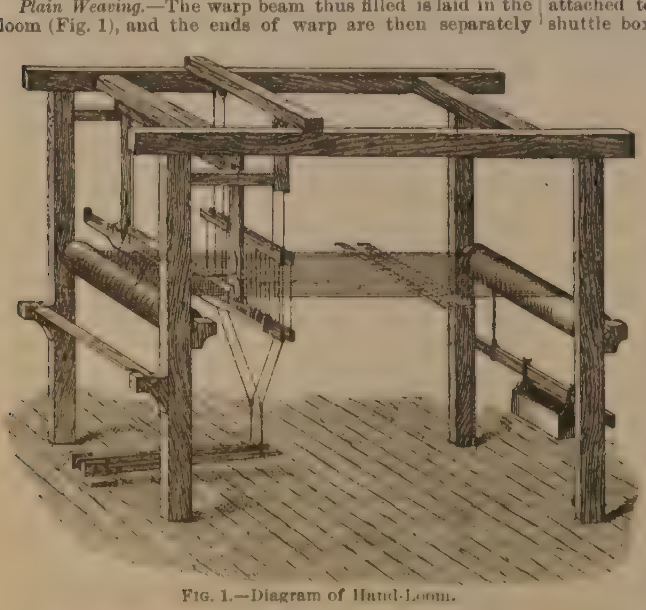

Fig. 1.—Diagram of Hand-Loom.

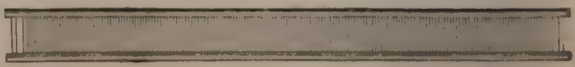

Fig. 2.—Weaver's Reed.

The three essential movements in weaving are (1) the "shedding" or dividing of the warp threads to permit of the passage between them of the shuttle containing the weft; (2) the "picking" or shooting of the weft; and (3) the "battening" or beating up of the weft. The shedding motion depends upon the heddles, which are corded or attached to a pair of treadles worked by the weaver's feet. Each treadle is connected with the heddles above and below by a system of levers or pulleys, so that the depression of one treadle while it raises one heddle depresses the other, and thus the opening or shed is made in the warp, one-half—consisting of alternate threads—being raised, the corresponding half pulled down. The weaver then with the left hand pushes the lay or batten back towards the heddles, till a sufficient portion of the shed is brought in front of the reed, and the depressed ends lie just over the shuttle race. A clear way is thus provided for picking or shooting the shuttle, which is done with a whipping jerk of the picking stick held in the right hand. This pulls the cord attached to the picker and projects the shuttle from one shuttle box into that at the opposite end of the lay. The lay is now drawn forward with the left hand, and the reed combs and beats up the weft thread. Treadle number two is next depressed and thereby a new shed is formed, the last made pick or shoot being enwrapped between the intersecting warp sheds; the lay is again thrown back, the pick of weft is shot and beaten up, and so on in regular succession (see Fig. 3).

In plain weaving it is possible to produce stripes by the use of bands of colored warp, and checks where both warp and weft are particolored. In the latter case shuttles, or at least cops, equal in number to the different colors of weft required, must be provided. It is obvious that the repeated changing of shuttles, and still more the withdrawing and replacing of cops in weaving with frequently changing weft, would occasion great loss of time. To avoid that, and to provide for the use of different colored wefts, or of wefts of various counts, the drop box was invented, a device by which two or more shuttles can be successively used in any order desired. The drop box, and its numerous subsequent modifications of circular and other change boxes, consists of a series of compartments or divisions in the shuttle box, each made to hold a separate shuttle. These several compartments are by mechanical agency brought in line with the shuttle race in the order in which the changes of weft picks are necessary.

Twill Weaving.—So long as only two sets or leaves of treadles are used in a loom very little in the form of a pattern can be produced, seeing no variation can be effected in the alternate raising of each heddle. To a limited extent a corded surface may be produced by passing two or three warp ends through each mail, and by throwing two or three picks of weft between each shed. But for effective figure-weaving there must be numerous possible variations of shed; and that is secured first by increasing the number of heddles in the loom. Thus with three heddles alone it is possible to effect six combinations of shedding, and as the number of heddles is added to the variations of possible shedding increase in geometrical ratio. But the number of treadles which can be corded up to separate heddles is in practice limited, and therefore only simple twill patterns are for the most part woven with treadles and heddles. A twill is a cloth in which the warp and weft do not intersect alternately, but where the warp predominates on the one side and the weft on the other. The simplest of all is the three-leaf twill, in which the warp passes over two and under one weft thread, and *vice versa*, in regular succession, giving the appearance of a succession of diagonal lines on the surface. Regular twills of from four to eight leaves are woven in the same manner, the weft rising over each fourth to eighth warp thread as the case may be. Many variations and combinations are possible in connection with these regular twills. For example, they may be combined with plain weaving: a cashmere twill may be made,—that is, a four-leaf combination, in which the weft passes alternately over and under two warp ends, and two picks are shot for each shed. Further, zig-zags, lozenges, squares, and other geometrical designs can be produced by reversing the order of the treading, and thereby causing the twill to run in different directions. The diagrams, Figs. 4 and 5, show two arrangements of a four-leaf twill, the first being a regular twill and the second a dimity, the dark squares representing the point at which the weft rises to the surfaces. Satin or broken twills are those in which the warp threads are not intersected by the weft in regular succession, but only at intervals, and thereby the smooth continuous surface characteristic of satin and damask is secured. Common satin and double damask are eight-leaf twills, the order in which the weft rises being shown in the diagram, Fig. 6. Rich satins may consist of sixteen to twenty leaf twills, the weft intersecting and binding down the warp at every sixteenth to twentieth pick as the case may be. Satins are usually woven with the face of the cloth downwards, because in weaving, say a sixteen-leaf satin, it would be necessary were the surface upwards to keep fifteen heddles raised and one down, whereas with the face of the cloth under, only one heddle has to be raised at a time.

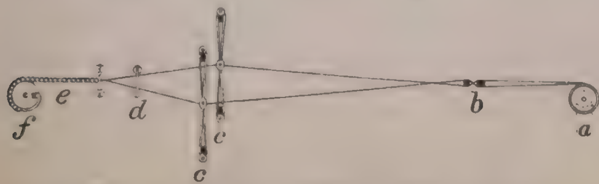

FIG. 3.—Section of plain web in process of weaving on the loom: *a*, warp beam; *b*, leash rods where the warp is divided and crossed; *c*, *c*, heddles; *d*, reed; *e*, the woven cloth; *f*, the cloth beam.

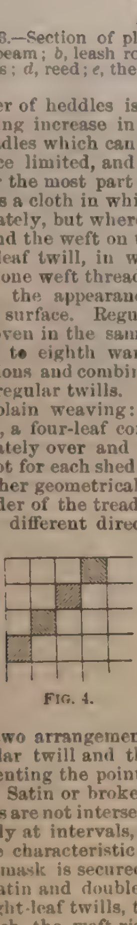

FIG. 4.

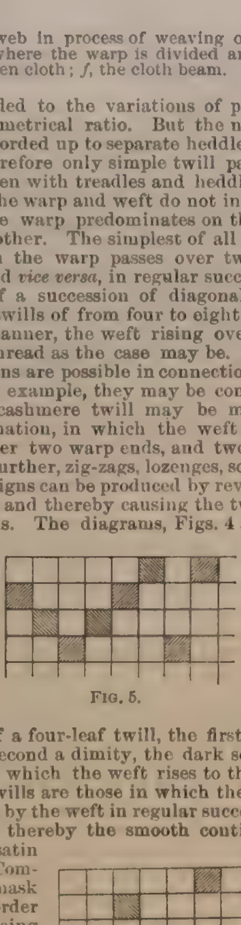

FIG. 5.

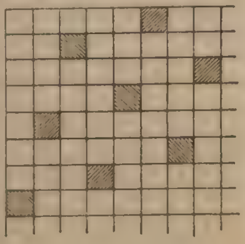

FIG. 6.

Figure Weaving.—Only a limited number of heddles can in actual working be attached each to a separate treadle to be under the control of the feet of the weaver. But to produce a complicated and irregular pattern a large number of different sheds of warp must be provided, and to secure with promptitude and certainty such manifold and complicated sheddings many of the most elegant and ingenious devices ever applied to mechanism have been invented. Before invention culminated in the Jacquard apparatus the draw loom or draw-boy loom was the machine employed for making figured patterns, such as damasks. In it each separate heddle shaft was fastened to a cord, which passed over a pulley, and coming down by the side of the loom these cords were arranged in a board in the order in which the heddles required to be drawn. The drawing of the cords and consequent formation of the shed was originally the work of a boy assistant, whence the name draw-boy loom; but it was found possible, by various mechanical attachments worked from the treadles, to dispense with extra aid to the weaver. But even with this arrangement the number of heddles which can be hung in any loom is limited, though, by using thin shafts and arranging them in tiers, as many as eighty or ninety may be accommodated. Since as many as a thousand separate sheds may be required to form a complete pattern, a device other than shafts or leaves of heddles becomes necessary; and the solution of the difficulty is found in hanging the individual heddle mails, not in shafts, but independently, each with a small lead weight called a lingo attached to it. Thus in effect a separate heddle is provided for each thread of warp, and it becomes possible to effect any combination of shed by cording together such leashes or mails as carry the warp threads to be raised. This tying together of the separate leashes, called "tying the harness" in the case of elaborate designs, is a tedious and difficult operation, requiring the exercise of considerable skill and patience. The successive sheds of a pattern being tied up, it is only necessary to have the cords arranged in the order in which they are to be drawn and attached to the mechanical device for pulling them, and forming the sheds in proper succession.

The Jacquard Loom.—The Jacquard apparatus is the most important and ingenious appliance which has ever been adapted to weaving, since by its agency it has become possible to produce the most intricate and extended patterns with the same certainty and with almost as much rapidity as plain cloth. The credit of introducing and making the machine a practical success—if not the whole honor of the invention—is due to Joseph Marie Jacquard of Lyons (see vol. xiii. p. 549). Attention was first directed to this ingenious artisan by a model of a net-making machine invented by him, which was deposited in the Conservatoire des Arts et Métiers. He was requested in 1801 by Napoleon to examine and improve on a complicated loom, and thereupon he undertook to produce a simple appliance to supplant the involved mechanism. The germs of the idea which he perfected had been, early in the eighteenth century, conceived by Bouchon and Falcon, and in 1745 it was further developed and improved by Jacques de Vaucanson. Indeed had Vaucanson been acquainted with the fly shuttle which was then known and used at least in England, it is probable he would have come to be regarded as the real inventor at once of the power-loom and of the apparatus which bears Jacquard's name.

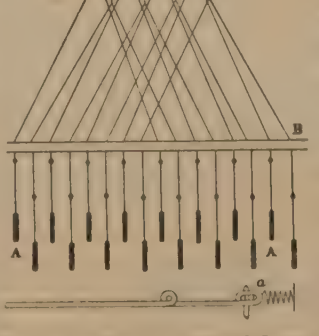

FIG. 7.—Diagram of Jacquard Loom.

The fundamental principle of the Jacquard apparatus is simple, although in its working fine mechanical details are essential. Its object is to effect the raising of any number of separate leashes, corded leashes, or heddles, in any order and succession without special tying of harness. How the apparatus works will be made plain by the diagram, Fig. 7. Here A, A represent the separate leashes through which the warp threads are drafted. It will be observed that these leashes are tied in pairs, but they might equally well be single, many together, or shafts of heddles. The cord from each separate leash passes through a finely perforated board B, called the comber-board, between which and C, the bottom-board, the pairs are tied to a cord. These cords pass up through the bottom board, and are caught in the lower hooks of a range of double-hooked long wires D, D. These hooked wires are supported and kept in position by being passed through loops or eyes in a range of cross-wires E, E. The head of each cross-wire is formed into an oblong eye as at *a* (an enlarged representation of a single cross-wire), through which a pin is passed for securing it in the spring-box F, in which each separate cross-wire presses against a small helical spring. The oblong eye permits a certain amount of play in the cross-wire, so that it can be pressed back against the helical spring when a force is applied at the opposite end. The points of the cross-wires pass through a perforated board G, called the needle-board, projecting about a quarter of an inch beyond its outer surface. The upper hooks of the upright wires threaded through these cross-wires are attached to a board H, called the griffe. The whole function of the apparatus is to liberate these hooks in the order and to the extent necessary for the successive sheds. The hooks are dislocated thus. At the side of the projecting points of the cross-wires there is a quadrangular frame I, called the cylinder. This cylinder can be drawn back, and turned so that each face may in succession be presented to and pressed against the face from which the cross-wires protrude. The cylinder alone does not affect the wires, but its function is to carry on its rotating faces a succession of pasteboard cards which are punctured with holes in a definite order. The wires connected with hooks which are not to be disturbed pass through the punctured holes and remain unaffected, while those supporting the hooks to be displaced are pressed back by the cardboard surface, and this motion of the cross-wire lifts the hook of the upright wire off the griffe. The griffe now rises, carrying with it the undisturbed hooks, making a shed of the warp threads attached to their cords. The weft is then shot, the griffe descends, and the next punctured card is by a quarter revolution of the cylinder brought into contact with the cross-wires, and so the work goes on, successive Jacquard cards being presented, new combinations of shed effected, and the weft shot till the pattern is completed. Hooks to any desired number may be arranged in a Jacquard apparatus, and when a separate hook is applied to each individual leash the most complete control and variety of shed may be secured. But in practice this is not necessary. Each repeat of a pattern across a web may be corded up to one series of hooks, and in many ways it is practicable to limit the number of hooks required in weaving and thus to simplify the apparatus itself, and the system of punctured cards by which its operation is governed. If the Jacquard apparatus, for example, is controlling only a few leaves of heddles, then only a corresponding number of hooks are called into use. Usually the machines are provided with 300, 400, 600, 900, and sometimes more hooks, and when intricate and extensive patterns are being woven two or more machines may be simultaneously brought to bear on the same loom.

The Power-Loom.—The first loom in which all the motions in weaving were connected and controlled by one motive power was the ribbon loom, known also as the Dutch or Dutch engine loom. A machine in which four to six pieces could be woven simultaneously is recorded to have been in existence in Dantzic in the last quarter of the 16th century (see RIBBONS, vol. xx. p. 546). In 1745 John Kay, inventor of the fly shuttle, and Joseph Stell patented improvements on the Dutch engine loom, which they said "may go or be worked by hands, water, or any other force." The ribbon loom may be regarded as a series of distinct looms mounted within one frame, each having its own warp and cloth beams, heddles, and shuttle, but all worked by one set of treadles and with a single batten. The shuttles are thrown across the narrow web by a rack-and-pinion arrangement; they are simultaneously shot, and each occupies the place of its next neighbor to the right or left alternately. The Jacquard apparatus and the drop-box arrangement for changing shuttles with change of weft are applied to the ribbon loom.

The application of power to the weaving of ordinary webs has developed along a different line, and the common power-loom has nothing to do with the ribbon loom. So early as 1678 there was figured and described in the French *Journal des Sçavans* a machine "for making linen cloth without the aid of a workman," the invention of De Gennes, a French naval officer. The loom made in 1745 by Vaucanson, which also foreshadowed the Jacquard apparatus, embodied many improvements on the conception of De Gennes, and presented some of the important features of the modern power loom. The practical realization of automatic weaving was, however, deferred for forty years, and the world owes it to a clergyman of the Church of England, the Rev. Dr. Edmund Cartwright. His own graphic account of the history of his invention has already been given under COTTON (see vol. vi. p. 444). Dr. Cartwright's original loom was but an imperfect machine, although his patent was minute and detailed. Both he and others devoted much labor to its improvement; and in bringing the invention to a successful issue he spent from £30,000 [$145,800] to £40,000 [$194,400], while in return he received only a gift of £10,000 [$48,600] in 1809 from the Government. The power-loom fought its way to supremacy but slowly, for an imperfect power-loom is no better than a hand-loom; and it was only after the minor adaptations and adjustments which frequently make the difference between success and failure were brought into operation that the real advantages of power-loom weaving became obvious. Even yet for many purposes the power-loom has not succeeded in supplanting hand-loom weaving.

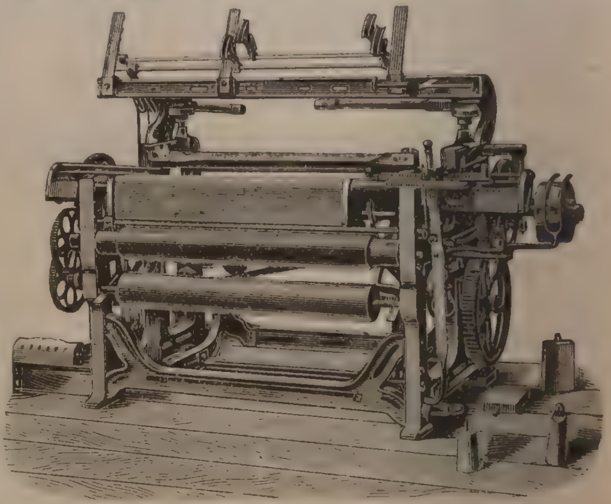

FIG. 8.—Power-Loom.

The power-loom (Fig. 8) differs much in appearance from the hand-loom, and is altogether more compact, from the fact that the lay, which is suspended from above in the latter, is in the power-loom centred below. The three principal motions, shedding, picking, and beating up, are of course the same in both. Motion is communicated to the working parts of the power-loom by the main or crank shaft, so called because it is provided with the two cranks which give oscillating motion to the lay. By toothed wheels the crank shaft controls the motion of the tappet shaft which carries on it the cams or tappets (1) for the picking motion called the picking tappets, and (2) for the treadles called the shedding tappets. The picking tappets have always a direct relation to the motion of the crank shaft, because for every beat of the lay there must be a corresponding pick. As there are two picking tappets the shaft is therefore geared to make half a revolution for each revolution of the crank shaft. The relation of the shedding tappets is not so regular, their rotation being dependent on the number of heddles or sheds of warp they control, and it is only in plain weaving that they correspond in motion with the picking tappets.

For the successful working of a power-loom several adjustments are necessary which are not required in the case of the hand-loom. The hand-loom weaver winds up his web on the cloth beam from time to time as the work progresses, and he moves forward the temples by which the woven fabric is kept extended to its proper breadth. In the power-loom these must be accomplished automatically, and the motions must be self-adjusting with the progress of weaving. More important still, a self-acting appliance must be provided to stop the motion of the loom in case of the weft thread becoming exhausted or being broken. This is secured by a delicate and ingenious contrivance called the "fork-and-grid stop motion," which depends for its action on the lightly balanced prongs of a fork. These prongs come in contact with the weft thread between the selvage of the web and the shuttle box each time the shuttle is shot to the side at which the apparatus is fixed. If the prongs meet no thread they are not thrown up, and being unmoved a connection is formed to the moving lay, and by a system of levers the loom is immediately thrown out of gear and stopped. Equally essential is it to provide means to stop the loom should the shuttle stick in the warp or otherwise fail to be carried from side to side of the lay. It is clear that, should the lay beat up with the shuttle sticking in the weft, there would ensue complete wreck of the warp. There are two ways of dealing with such a contingency. The first, invented in 1796 by Miller of Glasgow, is the "stop-rod motion," the action of which depends on the shuttle raising, as it enters the shuttle-box, a catch which if left down would strike against a frog or stop, and so throw the loom out of gear. The second device is the loose reed, in which there is an appliance for liberating the lower part of the reed when any obstruction is met in the warp, and thereby preventing a blow being given by the beating-up motion.

Double Cloth.—For many purposes the weaving of double cloth is important. It permits of the formation of a ground of inferior material with a surface of finest texture; and it affords great scope for the formation of colored patterns, allowing of the production of double-faced textures, which may or may not correspond in pattern according to pleasure. It moreover increases the thickness and weight of woven fabrics, and it is the basis of tubular weaving, such as is practiced for making hose, tubes, seamless sacking, etc. There are three classes of double textures. The first consists of double warp surfaces with the weft in the centre; in the second it is the reverse—a warp centre and two weft faces; and in both these classes the two sides may be of different colors if two colors of warp and weft respectively are employed. In the third case the cloth may consist of distinct warps and wefts throughout, and practically be two separate cloths. These, if bound at the selvages, would become woven tubes, and if at regular intervals over the surface a thread of warp or weft passes from the one into the other they are united as one texture. The intersection of double warps and wefts gives the opportunity of producing great diversity of color and pattern in any fabric without waste of material, and the manner in which patterns may pass from side to side is illustrated in the sectional diagram, Fig. 9. The diagram, Fig. 10, illustrates the method of producing a plain double cloth with the use of four heddles. Heddles 1 and 2 shed the upper cloth, 3 and 4 the lower. When a pick is being put in through the upper warp heddle 1 is up and all the others are down; and when the shuttle is passed through the lower web heddles 1, 2, 3 are raised and heddle 4 is depressed.

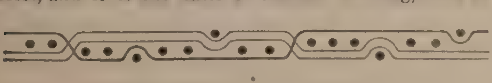

FIG. 9.—Section of Double Cloth.

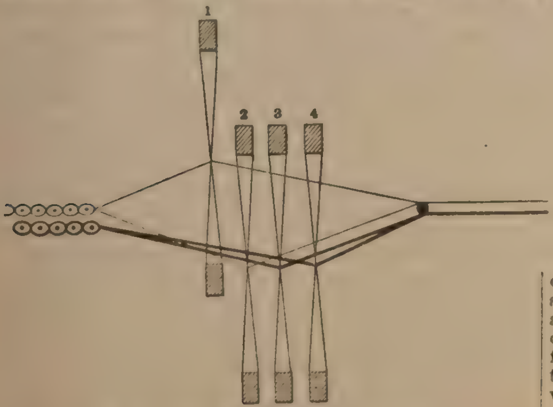

FIG. 10.—Method of Weaving Double Cloth.

Gauze Weaving.—Hitherto we have dealt only with methods of weaving in which the warp threads run parallel with each other and are intersected at right angles by the weft. In gauze weaving, by which effects intermediate between lace and plain cloth are produced, the warp threads are made to intertwist more or less among themselves, thereby favoring the production of light open textures, in which many ornamental lace-like combinations can be effected. Plain gauze is a thin open texture, in which two contiguous threads of warp make each a half twist around the other at every pick, the cloth having in section the appearance shown in Fig. 11. A leno consists of a kind of muslin in which the crossing or whip warp intertwists with its neighbor only at every fourth pick. In fancy gauzes the crossing or whip warp may cross and entwine several ordinary warp threads at once, and in numerous other ways the simple principle of intertwisting may be used for ornamental effect. The mutual entwining of warp threads is accomplished by an extra heddle called a "doup," placed in front of the common heddles. The doup consists of a half heddle threaded through the eye of a plain heddle, of which it forms a part. The cross or whip warps are drafted first through one of the ordinary heddles and then passed under the thread or threads they are intended to entwine, and drafted through the doup heddle, as seen in the diagram, Fig. 12, which shows the drafting of a plain gauze. The whole of the warp yarns which are to be entwined must with the whip warp be passed through a single split of the reed, except when the doups are placed in front of the reed, which is done in the case of complicated gauze weaving.

FIG. 11.—Section of ordinary Gauze.

Piled fabrics are textures woven with a looped or otherwise raised surface. Looped pile is any fabric in which the woven loops remain uncut, as in Brussels and tapestry carpets and terry velvets. When these loops are cut in the finished texture then the material is a cut pile, such as ordinary velvet, fustian, imitation sealskin, and other imitation furs. For ordinary loop and cut pile fabrics two warps are required, the regular beam warp and the "pole" or pile warp. The latter, being raised into loops, is worked up more rapidly than the ordinary warp, and it has consequently to be of greater length and wound on a separate beam. The ground or foundation may be either a plain or a twilled texture, and after every third pick of weft a wire is introduced into the shed and beaten up and woven into the cloth. In this way, by the stretching of the pile warp over the wire, a row of loops is formed across the web, the size of the loops being regulated by the size of the wire. If a looped pile is being woven then it only remains to pull out the wires from behind and again weave them in in front as the work proceeds. But if cut pile is being made, then either the loops must be cut along the top before the wire is withdrawn, or the wire may at one end be provided with a knife edge which itself cuts the loops as it is being pulled out. For velvets, etc., the wires are provided with a groove on their upper face, and along this groove a cut-

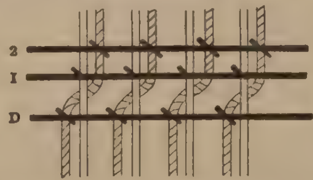

FIG. 12.—Drafting of Gauze Web. 1 and 2 ordinary heddles; D, doup heddle.

FIG. 13.—Section of Looped Pile Fabric.

ting knife called a trivet is run to cut the loops. In Fig. 13 the structure of a looped and cut velvet is illustrated. Fustian is a cut pile fabric in which the weft material, floated over the surface, forms the substance of the pile. It is not woven over wires, and the pile is cut by hand after the web leaves the loom. A third method of weaving pile fabrics consists of making a double web, the pile warp passing from the one to the other and binding them together, as shown in Fig. 14. When the connecting threads are cut they form a pile surface for each separate cloth. The great difficulty which has been encountered in perfecting this method of pile weaving has been to keep the connecting pile equal in length throughout, and to cut it so as to produce uniform level surfaces. The success which has been attained in plush weaving with double cloth is largely due to the patient and well-directed efforts of Mr. S. C. Lister, of Manningham Mills, Bradford.

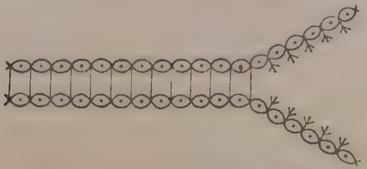

FIG. 14.—Section of Double-Web Plush.

There are many subsidiary but highly important and most ingenious features of the art of weaving, specially in connection with the production of ornamental surfaces, for notice of which it has been impossible to find room in the preceding summary. The extent and complexity of the whole subject renders the presentation of a satisfactory outline of the art a matter of unusual difficulty; but those who wish to pursue the subject in detail, in addition to copious information to be gleaned from technical journals, may consult Darlow's *History and Principles of Weaving* (London, 1878), Ashenhurst's *Weaving and Designing of Textile Fabrics* (Bradford, 1879), and Brown's *Practical Treatise on the Art of Weaving* (4th ed., Dundee, 1883). To the two works first named we have to acknowledge our indebtedness for the suggestions of several diagrams. (J. PA.)

WEBER, CARL MARIA FRIEDRICH ERNST VON (1786–1826), musical composer and creator of "romantic opera," was born at Eutin, near Lübeck, December 18, 1786, of a family that had long been devoted to art. His father, Baron Franz Anton von Weber, a military officer in the service of the palgrave Karl Theodor, was an excellent violinist, and his mother once sang on the stage. His cousins, Josepha, Aloysia, Constanze, and Sophie, daughters of Franz Anton's brother Fridolin, attained a high reputation as vocalists. Mozart, after having been cruelly deceived by Aloysia, made Constanze his wife, and thus became Franz Anton's nephew by marriage. Fridolin played the violin nearly as well as his brother; and the whole family displayed exceptional talent for music.

Franz Anton von Weber was a man of thriftless habits and culpable eccentricity. Having been wounded at Rosbach, he quitted the army, and in 1758 he was appointed financial councillor to Clement August, elector of Cologne, who for nine years overlooked his incorrigible neglect of duty. But the elector's successor dismissed him in 1768; and for many years after this he lived in idleness at Hildesheim, squandering the property of his wife, Anna de' Fumetti, and doing nothing for the support of his children until 1778, when he was appointed director of the opera at Lübeck. In 1779 the prince bishop of Eutin made him his kapellmeister, and not long afterwards his wife died of a broken heart. Five years later he went to Vienna, placed two of his sons under Michael Haydn, and in 1785 married the young Viennese singer Genovefa von Brenner, who in the following year gave birth, at Eutin, to the subject of the present article—a delicate child, afflicted with congenital disease of the hip-joint.

On his return from Vienna, Franz Anton, finding that a new kapellmeister had been chosen in his place, accepted the humbler position of "Stadt Musikant." This, however, he soon relinquished; and for some years he wandered from town to town giving dramatic performances, in conjunction with the children of his first wife, wherever he could collect an audience. The effect of this restless life upon the Little Carl Maria's health and education was deplorable; but, as he accompanied his father everywhere, he became familiarized with the stage from his earliest infancy, and thus gained an amount of dramatic experience that indisputably laid the foundation of his future greatness. Franz Anton hoped to see him develop into an infant prodigy, like his cousin Mozart, whose marvellous career was then rapidly approaching its close. In furtherance of this scheme the child was taught to sing and place his fingers upon the pianoforte almost as soon as he could speak, though he was unable to walk until he was four years old. Happily his power of observation and aptitude for general learning were so precocious that he seems, in spite of all these disadvantages, to have instinctively educated himself as became a gentleman. His first music-master was Keuschler, who gave him instructions at Weimar in 1796.[1] In 1798 Michael Haydn taught him gratuitously at Salzburg. In the March of that year his mother died, like her predecessor, of chagrin. In April the family visited Vienna, removing in the autumn to Munich. Here the child's first composition—a set of "Six Fughettas"—was published, with a pompous dedication to his half-brother Edmund; and here also he took lessons in singing from Valesi, and in composition from Kalcher, under whom he made rapid progress. Soon after this he began to play successfully in public, and his father compelled him to write incessantly. Among the compositions of this period were a mass and an opera—*Die Macht der Liebe und des Weins*—now destroyed. A set of "Variations for the Pianoforte," composed a little later, and dedicated to Kalcher, was lithographed by Carl Maria himself, under the guidance of Senefelder, the inventor of the process, in which both the father and the child took great interest.

In 1800 the family removed to Freiberg, where the Ritter von Steinsberg gave Carl Maria the libretto of an opera called *Das Waldmädchen*, which the boy, though not yet fourteen years old, at once set to music, and produced in November at the Freiberg theatre. The performance was by no means successful, and the composer himself was accustomed to speak of the work as "a very immature production"; yet it was afterwards reproduced at Chemnitz, and even at Vienna.

Carl Maria returned with his father to Salzburg in 1801, resuming his studies under Michael Haydn, and forming a close friendship with the Chevalier Neukomm. Here also he composed his second opera, *Peter Schmoll und seine Nachbarn*, which was unsuccessfully produced at Nuremberg in 1803. In that year he again visited Vienna, where, though the veterans Haydn and Albrechtsberger were both receiving pupils, his father preferred placing him under the Abbé Vogler, a man of kind and sympathetic nature, but quite unfit to train so great a genius. Through Vogler's instrumentality Carl Maria was appointed conductor of the opera at Breslau, before he had completed his eighteenth year. In this capacity he greatly enlarged his experience of the stage; but he lived a sadly irregular life, contracted debts which his slender salary was insufficient to defray, and lost his beautiful voice through accidentally drinking a poisonous liquid used in lithography,—a mishap that nearly cost him his life. These hindrances, however, did not prevent him from beginning a new opera called *Rübezahl*, the libretto of which was based upon a well-known legend of the Riesengebirge. The plot of the piece was "romantic" to the last degree, and Weber worked at it enthusiastically, but it was never completed, and little of it has been preserved beyond a quintett and the masterly overture, which, re-written in 1811 under the title of *Der Beherrscher der Geister*, now ranks among its author's finest instrumental compositions.

---

[1] [Simpson's translation of Weber's life by his son (London, 1865) puts the young musician in this year at Hildburghausen, and names his first master Heuschkel.—AM. ED.]

Quitting Breslau in 1806, Weber removed in the following year to Stuttgart, where he had been offered the post of private secretary to Duke Ludwig, brother of Frederick, king of Würtemberg. The appointment was a disastrous one. The stipend attached to it was insufficient to meet the twofold demands of the young man's new social position and the thriftlessness of his father, who was entirely dependent upon him for support. Court life at Stuttgart was uncongenial to him, though he yielded to its temptations. The king hated him. He fell hopelessly into debt, and, worse than all, became involved in a fatal intimacy with Margarethe Lang, a singer at the opera. Notwithstanding these distractions he worked hard, and in 1809 re-modelled *Das Waldmädchen*, under the title of *Sylvana*,[1] and prepared to produce it at the court theatre. But a dreadful calamity prevented its performance. Franz Anton had misappropriated a large sum of money placed in the young secretary's hands for the purpose of clearing a mortgage upon one of the duke's estates.[2] Both father and son were charged with embezzlement, and, on February 9, 1810, they were arrested at the theatre, during a rehearsal of *Sylvana*, and thrown by the king's order into prison. No one doubted Weber's innocence, but after a summary trial he and his father were ordered to quit the country, and on February 27th they began a new life at Mannheim.

Having provided a comfortable home for his father, and begun the composition of a new comic opera, in one act, called *Abu Hassan*, Weber removed to Darmstadt in order to be near his old master the Abbé Vogler, and his fellow-pupils Meyerbeer and Gänsbacher, with whom he lived on terms of the closest intimacy. On September 16, 1810, he reproduced *Sylvana* under its new title at Frankfort, but with very doubtful success. *Abu Hassan* was completed at Darmstadt in January, 1811, after many interruptions, one of which exercised a memorable influence upon his later career. While reading with his friend, Alexander von Dusch, George Apel's then recently published *Gespensterbuch*, he was so much struck with the story of *Der Freischütz* that he at once began to meditate upon its transformation into an opera, and the two friends actually set to work upon it then and there. But it was not until many years afterwards that the idea was carried out in a practical form.

Weber started in February, 1811, on an extended artistic tour, during the course of which he made many influential friends, and on June 4th brought out *Abu Hassan* with marked success at Munich. His father died at Mannheim in 1812, and after this he had no settled home, until in 1813 his wanderings were brought to an end by the unexpected offer of an appointment as kapellmeister at Prague, coupled with the duty of entirely remodelling the performances at the opera-house. The terms were so liberal that he accepted at once, engaged a new company of performers, and governed them with uninterrupted success until the autumn of 1816. During this period he composed no new operas, but he had already written much of his best pianoforte music, and played it with never-failing success, while the disturbed state of Europe inspired him with some of the finest patriotic melodies in existence. First among these stand ten songs from Körner's *Leyer und Schwerdt*, including "Vater, ich rufe dich," and "Lützow's wilde Jagd;" and in no respect inferior to these are the splendid choruses in his cantata *Kampf und Sieg*, which was first performed at Prague, December 22, 1815.

Weber resigned his office at Prague, September 30, 1816, and on December 21 Frederick Augustus, king of Saxony, appointed him kapellmeister at the German opera at Dresden. The Italian operas performed at the court theatre were superintended by Morlacchi, whose jealous and intriguing disposition produced an endless amount of trouble and annoyance. The king, however, placed the two kapellmeisters on an exact equality both of title and salary, and Weber found ample opportunity for the exercise of his remarkable power of organization and control. And now he once more gave his attention to the story of *Der Freischütz*, which, with the assistance of Friedrich Kind, he developed into an admirable libretto, under the title of *Des Jägers Braut*.

The legend of "The Seventh Bullet," though well known in the 17th century, and probably much earlier, seems to have been first given to the world in a connected form in a work entitled *Unterredungen vom Reiche der Geister*, the second edition of which was printed at Leipsic in 1731. In this version of the story the scene is laid in Bohemia, and the action referred to the year 1710. Apel reproduced the legend under the title of "Der Freischütz," in the first volume of his *Gespensterbuch*, in 1810. Since then the story has been repeated in many varying forms, but it was Apel's version that first attracted Weber's attention, and it was from this that he and Kind together made their first sketch of the libretto, on February 21, 1817, though they found it necessary to increase the interest of the drama by the introduction of some accessory characters, and to substitute a happy ending for the fatal catastrophe of the original story. No subject could have been better fitted than this to serve as a vehicle for the new art-form which, under Weber's skilful management, developed into what is now universally recognized as the prototype of the true "romantic opera." He had dealt with the supernatural in *Rübezahl*, and in *Sylvana* with the pomp and circumstance of chivalry, but in neither case with the unquestioning faith which alone can invest the treatment of such subjects with befitting dignity. The shadowy impersonations in *Rübezahl* are scarcely less human than the heroine who invokes them; and the music of *Sylvana* might easily have been adapted to a story of the 19th century. But in the master's later operas all this is changed. We cannot choose but shudder at the fiend in *Der Freischütz*, for the infernal apparition comes straight to us from the nether world. Every note in *Euryanthe* breathes the spirit of mediæval romance; and the fairies in *Oberon* have a real existence, quite distinct from the tinsel of the stage. And this it is,—this uncompromising reality, even in face of the unreal,—that forms the strongest characteristic of the pure "romantic school," as Weber understood and created it. It is true to nature even when dealing with the supernatural, for it treats its wildest subjects in earnest, and without a doubt as to the reality of the scenes it ventures to depict, or the truthfulness of their dramatic interpretation.

Weber and Kind sketched the *scenario* of the new opera in February, 1817. On March 1 the poet placed the complete libretto in the hands of the composer, who wrote the first note of the music on July 2—beginning with the duet which opens the second act. But so numerous were the interruptions caused by Morlacchi's intrigues, the insolence of unfriendly courtiers, and the attacks of jealous critics that nearly three years elapsed before the piece was completed. In the meantime the performances at the opera-house were no less successfully remodelled at Dresden than they had already been at Prague, though the work of reformation was far more difficult; for the new kapellmeister was surrounded by enemies who openly subjected him to every possible annoyance, and even the king himself was at one time strongly prejudiced against him. Happily, he no longer stood alone in the world. Having, after much difficulty, broken off his miserable intimacy with Margarethe Lang, he married the well-known vocalist, Carolina Brandt, a noble-minded woman and consummate artiste, whose advice, even on subjects connected with the new opera, was extremely valuable. The great work was completed May 13, 1820, on which day Weber wrote the last note of the overture,—a portion of the design which, for obvious reasons, it was his custom to postpone until the rest of the music was finished. There is abundant evidence to prove that he was well satisfied with the result of his labors; but he gave himself no rest. He had engaged to compose the music to Wolff's Gipsy drama, *Preciosa*. Two months later this also was finished, and both pieces ready for the stage.

---

[1] As the MS. of *Das Waldmädchen* has been lost, it is impossible now to determine its exact relation to the later work.

[2] Spitta gives a different account of the occurrence, and attributes the robbery to a servant.

In consequence of the unsatisfactory state of affairs at Dresden, it had been arranged that both *Preciosa* and *Der Freischütz*—no longer known by its original title, *Des Jägers Braut*—should be produced at Berlin. In February, 1821, Sir Julius Benedict was accepted by Weber as a pupil; and to his pen we owe a delightful account of the rehearsals and first performance of his master's *chef d'œuvre*. *Preciosa* was produced with great success at the old Berlin opera-house on June 14, 1821. On June 18, the anniversary of the battle of Waterloo, the opening of the new "Schauspielhaus" was celebrated by the production of *Der Freischütz*. Much anxiety was caused by unforeseen difficulties at the rehearsals; yet, so calm was Weber's mind that he devoted his leisure time to the composition of his *Concertstück* in F minor—one of his finest pianoforte pieces. Until the last moment his friends were anxious; the author was not, and the result justified his confidence in his own powers. The success of the piece was triumphant. The work was received with equal enthusiasm at Vienna on October 3, and at Dresden on January 26, 1822. Yet Weber's position as kapellmeister was not much improved by his success, though, in order to remain faithful to his engagements, he had refused tempting offers at Berlin and Cassel, and, at the last-named place, had installed Ludwig Spohr in a position much more advantageous than his own.

For his next opera Weber accepted a libretto based, by Frau Wilhelmine von Chezy, on the story of *Euryanthe*, as originally told in the 13th century, in Gilbert de Montreuil's *Roman de la Violette*, and repeated with alterations in the *Decamerone*, in Shakespeare's *Cymbeline*, and in several later forms. In place of the ghostly horrors of *Der Freischütz*, the romantic element was here supplied by the chivalric pomp of the Middle Ages. The libretto, though soundly abused by shallow critics, is really an exceptionally good one—in one respect superior to that of *Der Freischütz*, inasmuch as it substitutes elaborate recitative for the spoken dialogue peculiar to the German "Schauspiel" and French "opéra comique." It is, in fact, a "grand opera" in every sense of the words,—the prototype of the "musical drama" perfected fifty years later by Wagner. The overture—as usual, written last—presents a feature that has never been imitated. During its performance the curtain temporarily rises, to exhibit, in a *tableau vivant*, the scene in the sepulchral vault upon which the whole story turns. This episode is now rarely presented; but Weber himself well knew how much the interest of the piece depended on it. The work was produced at the Kärntnerthor theatre in Vienna, October 25, 1823, and received with enthusiasm. Being of a less popular character than *Der Freischütz*, it is not so frequently performed; but it still retains its place upon the stage, and ranks among the finest "romantic operas" that have ever been written.

Weber's third and last dramatic masterpiece was an English opera, written for Covent Garden theatre, upon a libretto adapted by Planché from Wieland's *Oberon*. Destined for the English stage sixty years ago, this was necessarily disfigured by the spoken dialogue abandoned in *Euryanthe*; but in musical beauty it is quite equal to it, while its fairies and mermaids are as vividly real as the spectres in *Der Freischütz*. Though already far gone in consumption, Weber began to compose the music on January 23, 1825. Charles Kemble had offered him £1000 [$4860] for the work, and he could not afford to rest. He finished the overture in London, at the house of Sir George Smart, soon after his arrival, in March, 1826; and on April 12 the work was produced with triumphant success. But it cost the composer his life. Wearied out with rehearsals and performances of the opera, and concerts at which he was received with rapturous applause, he grew daily perceptibly weaker; and, notwithstanding the care of his kind host, Sir George Smart, and his family, he was found dead in his bed on the morning of June 5, 1826. For eighteen years his remains rested in a temporary grave in Moorfields chapel; but in 1844 they were removed and placed in the family vault at Dresden.

Besides his three great dramatic masterpieces and the other works already mentioned, Weber wrote two masses, two symphonies, eight cantatas, and a vast amount of songs, orchestral and pianoforte pieces, and music of other kinds, amounting altogether to more than 250 compositions.

(W. S. R.)

WEBER'S LAW is the principal generalization of that branch of scientific investigation which has come to be known as "psycho-physics." According to Fechner, who has done most to prosecute these inquiries and to consolidate them under a separate name "psycho-physics is an an exact doctrine of the relation of function or dependence between body and soul." In other words, it is throughout an attempt to submit to definite measurement the relation of physical stimuli to the resulting psychical or mental facts, and forms an important department of experimental psychology. It deals with the quantitative aspects of mental facts—their intensity or quantity proper and their duration. Physical science enables us, at least in the case of some of the senses, to measure with accuracy the objective amount of the stimulus, and introspection enables us to state the nature of the subjective result. Thus we are able to say whether a stimulus produces *any* psychical result, and can fix in that way the *minimum sensibile* or "threshold of consciousness" for each of the senses. In like manner (though with less accuracy, owing to the disturbing nature of the conditions) we can fix the sensational maximum, or upper limit of sensibility, in the different senses, that is to say, the point beyond which no increase of stimulus produces any appreciable increase of sensation. We thus determine, as Wundt puts it, the limit-values between which changes of intensity in the stimulus are accompanied by changes in sensation. But the central inquiry of psycho-physics remains behind. Between the quantitative minimum and the quantitative maximum thus fixed can we discover any definite relation between changes in the objective intensity of the stimuli and changes in the intensity of the sensations as estimated by consciousness? The answer of psycho-physics to this inquiry is given in the generalization variously known as "Weber's law," "Fechner's law," or the "psycho-physical law," which professes to formulate with exactitude the relations which exist between change of stimulus and change of sensation.

As we have no means of subjectively measuring the absolute intensity of our sensations, it is necessary to depend upon the mental estimate or comparison of two or more sensations. Comparison enables us to say whether they are equal in intensity, or if unequal which is the greater and which is the less. But as they approach equality in this respect it becomes more and more difficult to detect the difference. By a series of experiments, therefore, it will be possible, in the case of any particular individual, to determine the least observable difference in intensity between two sensations of any particular sense. This least observable difference is called by Fechner the "Unterschiedsschwelle," or "difference-threshold," that is to say, the limit of the discriminative sensibility of the sense in question. That such a "threshold," or least observable difference, exists is plain from very simple examples. Very small increases may be made in the objective amount of light, sound, or pressure—that is, in the physical stimuli applied to these senses—without the subject on whom the experiment is made detecting any change. It is further evident that, by means of this "Unterschiedsschwelle," it is possible to compare the discriminative sensibility of different individuals, or of different senses, or (as in the case of the skin) of different parts of the same sense organ: the smaller the difference observable the finer the discriminative sensibility. Thus the discrimination of the muscular sense is much more delicate than that of the sense of touch or pressure, and the discriminative sensibility of the skin and the retina varies very much according to the parts of the surface affected. Various methods have been adopted with a view to determine these *minima* of discriminative sensibility with an approach to scientific precision. The first is that employed by Weber himself, and has been named the method of just observable differences. It consists either in gradually adding to a given stimulus small amounts which at first cause no perceptible difference in sensation but at a certain point do cause a difference to emerge in consciousness, or, *vice versa*, in gradually decreasing the amount of additional stimulus, till the difference originally perceived becomes imperceptible. By taking the average of a number of such results, the minimum may be determined with tolerable accuracy. The second method is called by Fechner the method of correct and incorrect instances. When two stimuli are very nearly equal the subject will often fail to recognize which is the greater, saying sometimes that A is greater, sometimes that B is greater. When in a large number of trials the right and wrong guesses exactly balance one another we may conclude that the difference between the two stimuli is not appreciable by the sense. On the other hand, as soon as the number of correct guesses definitely exceeds half of the total number of cases, it may be inferred that there is a certain subjective appreciation of difference. This method was first employed by Vierordt. The third method, that of average errors, is very similar to the one just explained. Here a certain weight (to take a concrete example) is laid upon the hand of the person experimented upon, and he is asked, by the aid of subjective impression alone, to fix upon a second weight exactly equal to the first. It is found that the second weight sometimes slightly exceeds the first, sometimes slightly falls below it. Whether above or below is of no consequence to the method, which depends solely on the amount of the error. After a number of experiments, the different errors are added together, and the result being divided by the number of experiments gives us the average error which the subject may be calculated upon to make. This marks the amount of stimulus which is just below the difference-threshold for him. This method was first employed by Fechner and Volkmann. The different methods were first named, and the theory of their application developed by Fechner, in his *Elemente der Psychophysik* (1860).

These methods have been chiefly applied to determine the relation of the difference-threshold to the absolute magnitude of the stimuli employed. For a very little reflection tells us that the smallest perceivable difference is not an amount whose absolute intensity is constant even within the same sense. It varies with the intensity of the stimuli employed. We are unable, for example, to recognize slight differences in weight when the weights compared are heavy, though we should be perfectly able to make the distinction if the weights compared were both light. Ordinary observation would lead us, therefore, to the conclusion that the greater the intensity of the original stimulus at work the greater must be the increase of stimulus in order that there may be a perceptible difference in the resulting sensation. E. H. Weber (1795–1878) was the first (after a prolonged series of experiments on the sensations of sight, hearing, and touch) to clothe this generality with scientific precision by formulating the law which has since gone by his name. The purport of the law is that, in order that the sensational difference may remain unchanged, the increase of stimulus must maintain the same proportion to the intensity of the preceding stimulus. The smallest perceptible difference is therefore not absolutely the same, but it remains relatively the same, that is, it remains the same fraction of the preceding stimulus. For example, if we can distinguish 16 oz. and 17 oz., we shall be able to distinguish 32 oz. and 34 oz. but not 32 oz. and 33 oz., the addition being in each case $\frac{1}{16}$ of the preceding stimulus. This fraction (supposing it to be the difference-threshold of the muscular sense) remains a constant, however light or however heavy the weights compared. The law may be formulated thus: The difference between any two stimuli is experienced as of equal magnitude, in case the mathematical relation of these stimuli remains unaltered. Or, otherwise expressed, in order that the intensity of a sensation may increase in arithmetical progression, the stimulus must increase in geometrical progression. It is also expressed by Fechner in the form—The sensation increases as the logarithm of the stimulus.

The law has been variously interpreted. Fechner himself designated it the psycho-physical law, and treated it as the fundamental formula of the relation between body and mind, thus assigning to it an ontological dignity and significance. But in this "psycho-physical" interpretation of his results he has not had a numerous following. Wundt interprets the law in a purely "psychological" sense, making it a special instance of the general law of relativity which governs our mental states. Introspection can give us no information as to the absolute intensity of the stimulus; for a stimulus is known in consciousness only through its sensational resultant. Hence, he argues, we can only compare one psychical state with another, and our standard of measurement is therefore necessarily a relative one; it depends directly upon the preceding state with which we compare the present. Others have attempted to give the law a purely physical or "physiological" explanation. Instead of holding with Fechner that the law expresses a recondite relation between the material and the spiritual world, they prefer to regard the quantitative relation between the last physical antecedent in the brain and the resultant mental change as *prima facie* one of simple proportion, and to treat Weber's law as holding between the initial physical stimulus and the final action of the nerve-centres. According to this interpretation, the law would be altogether due to the nature of nervous action. As a nerve, says Sully, after a temporary degree of stimulation temporarily loses its sensibility, so the greater the previous stimulation of a nerve the greater is the additional stimulus required to produce an appreciable amount of sensation.

Weber's law, it must be added, holds only within certain limits. In the "chemical" senses of taste and smell experiments are almost impossible. It is not practicable to limit the amount of the stimulus with the necessary exactitude, and the results are further vitiated by the long continuance of the physiological effects. The same considerations apply with still more force to the organic sensations, and the results in the case of temperature sensations are completely uncertain. The law is approximately true in the case of sight, hearing, pressure, and the muscular sense,—most exactly in the case of sound. As this is the sense which affords the greatest facilities for measuring the precise amount of the stimulus, it may perhaps be inferred that, if we could attain the same exactitude in the other senses, with the elimination of the numerous disturbing extraneous influences at work, the law would vindicate itself with the same exactitude and certainty. It is further to be noted, however, that even in those senses in which it has been approximately verified, the law holds with stringency only within certain limits. The results are most exact in the middle regions of the sensory scale; on the contrary, when we approach the upper or lower limit of sensibility, they become quite uncertain.

Literature.—Weber's investigations were given to the public in his article in Wagner's *Handwörterbuch der Physiologie.* Fechner's *Elemente der Psycho-pkysik,* referred to above, was published in 1860, and contains an elaborate exposition of the whole subject. He replied to his critics in two later works, *In Sachen der Psycho-physik* (1877) and *Rreision der Hauptpunkte der Psysho-physik* (1882). Delbœuf's *Étude psychophysique* (1873), and G. E. Müller's *Zur Grundlegung der Psycho-physik,* are also important documents; and the subject is fully treated in Wundt's *Physiologische Psychologie* and in Ladd's *Physiological Psychology,* which is based upon Wundt. Two English monographs may be referred to as containing important criticisms of the law,—the paper of Messrs. Dewar and McKendrick in the *Transactions of the Royal Society of Edinburgh* for 1873, and Mr. James Ward's "Attempt to Interpret Fechner's Law," in *Mind,* i. 452 *sq.* (A. SE.)

WEBSTER, DANIEL (1782–1852), American statesman, was born at Salisbury, New Hampshire, January 18, 1782. His family can be traced back without difficulty to Thomas Webster, of Scottish ancestry,[1] who settled in New Hampshire in 1636, but no further. Ebenezer Webster, the father of Daniel, rose to the rank of captain in the "French and Indian War." From him his sons Ezekiel and Daniel inherited great physical force; their mother, Abigail Eastman, gave them their intellectual powers. Daniel always insisted on considering his elder brother, who became a leading lawyer in his native State, as really his superior in intellect, and the correspondence between them was close and confidential until Ezekiel's death in 1829. Living on the frontier, Daniel was compelled to depend for early education on his mother and on the scanty schooling customary in winter; and for much of this he was indebted to the fact that he was physically the weakest of his family. It is a little odd, however, that he failed utterly in that with which his final reputation was so closely connected. In his own words: "There was one thing I could not do: I could not make a declamation; I could not speak before the school." When he was fifteen years old a family council decided to send him to college, a step involving severe abstinence and additional struggle on the part of his immediate relatives. After an imperfect preparation, he graduated at Dartmouth College in 1801, studied law, and was admitted to the bar in Boston in 1805, from the office of Christopher Gore.

Regard for his father made Webster begin practice in the town of Boscawen, near his early home; but his father died within a year, and he removed to Portsmouth, the largest town of the State. Here he took a leading place at the bar, having but one rival. In May, 1813, he entered Congress as a representative from New Hampshire, being placed at once on the committee of foreign affairs. As a moderate Federalist, he held that attacks on Canada should cease, and that the war should be confined to the ocean. His first speech[2] showed that the raw New Hampshire boy of a dozen years before had developed new powers. "If the war must continue, go to the ocean. If you are seriously contending for maritime rights, go to the theatre where alone those rights can be defended. Thither every indication of your fortune points you. There the united wishes and exertions of the nation will go with you. Even our party divisions, acrimonious as they are, cease at the water's edge." The position of any Federalist in Congress, however, was not a wide sphere of influence; and Webster, removing to Boston in 1816, gave up political life for some years.

At the Massachusetts bar Webster soon gained a place as prominent as he had held in New Hampshire, and within three years his reputation as a lawyer had become national. His national standing was gained by his argument in the "Dartmouth College case," practically endorsed by the Supreme Court. Dartmouth College had been chartered by the king in 1769. In 1816 the New Hampshire legislature undertook to alter the charter and reorganize the corporation; and the State courts sustained the legislature in a suit brought by the old trustees against the new. On appeal to the Supreme Court of the United States in 1818, Webster contended that the College was an eleemosynary corporation, over which the legislature had no more power than the king who chartered it; that the king had no power to void such a charter, and the New Hampshire legislature no such sovereign powers as parliament; that the legislature's action came within the Federal constitution's prohibition of State legislation altering contracts; that "the charter of 1769 is a contract;" that "the acts in question impair this contract;" and that they were therefore unconstitutional and void. The Supreme Court upheld Webster's view, and it was soon seen that he had worked a serious change in the relations of the States to corporations, as they had thus far been understood. The States endeavored to meet the new rule by inserting in their charters clauses retaining the right to alter them; but the spirit of the "Dartmouth College case," which has always had its opponents among American lawyers, has had its influence upon judges everywhere, in every variety of cognate cases. From this time Webster was recognized as the leading lawyer of the country, and his services were in constant demand.

His cases are quite beyond statement within the space here available. Some of his leading constitutional cases were those of Gibbons *v.* Ogden, in 1824, in which he overthrew the action of the New York legislature, in granting to Ogden, assignee of Fulton and Livingston, a monopoly of steam navigation in New York waters, as an interference with the right of Congress to regulate commerce; Ogden *v.* Saunders, in 1827, in which he attacked the right of a State to pass bankruptcy laws; the Girard College case, in 1844, in which he maintained that Christianity was an essential part of the common law; and the case of Luther *v.* Borden, commonly known as the Rhode Island case, in 1848, in which he laid the foundation for the subsequent definition of the "guarantee clause" of the constitution, and stated the meaning of the "republican government" of a State. Like other American lawyers, he made no distinction in his practice between kinds of cases, and was often retained in criminal causes. The most celebrated of these were the trials of Goodridge and Knapp; in the latter (6 Webster's *Works,* 53) is the passage on the power of conscience, which has been declaimed by countless American schoolboys.

Webster's reputation as an orator began with his address at Plymouth in 1820, on the 200th anniversary of the landing of the Pilgrims. It was increased by his address at the laying of the corner-stone of the Bunker Hill monument in 1825, on the 50th anniversary of the battle, and by that which commemorated in 1826 the 50th anniversary of the Declaration of Independence and the coincident deaths of Jefferson and John Adams. On every great public occasion thereafter, if Webster was obtainable, he was held to be the natural speaker to be chosen. His finest subsequent speeches were made on the completion of the Bunker Hill monument in 1843, and at the laying of the corner-stone of the addition to the Capitol at Washington in 1851.

---

[1] [Thomas Webster, of Ormsby, Norfolk county, England, came to Hampton, N. H., about 1636. His son Thomas, born at Hampton, 1656, died there in 1718. There were three successive Ebenezer Websters; viz.—a son of Thomas born 1667; his son born 1714; and the father of Daniel, born 1739.—AM. ED.]

[2] [His first congressional speech was on the Berlin and Milan decrees.—AM. ED.]

In December, 1823, Webster returned to Congress as a representative from Massachusetts, and his first speech, in January, 1824, in support of a resolution to send a commissioner to Greece, then in insurrection, made him the first of Congressional speakers. During his service in the house the tariff of 1824 came up for discussion. Representing a commercial district, Webster's speech has always been a source of gratification to American opponents of protection. He repudiated the name of "American system" claimed by Clay for the system of protection which he was introducing. He cited with cordial approval the expressed belief of English statesmen that English manufactures had prospered in spite of protection, not because of it, and their desire for "unrestricted trade." He attacked the "old notion" of the balance of trade with such vigor that he felt compelled to apologize "for speaking irreverently of the dead." He stated the manner in which, under unrestricted trade, the American production in cotton, woollens, and iron had already come to rival that of England, protected for hundreds of years, and the loss in labor which would come from an attempt, by legal protection, to "support a business that cannot support itself." The whole speech would be a very striking free-trade argument even at the present day. When the tariff of 1828, which was still more protective, came up for discussion, Webster had ceased to oppose protection; but his speech does not attempt to argue in favor of it. It states that his people, after giving warning in 1824 that they would consider protection as the policy of the Government, had gone into protected manufactures, and that he now asks that that policy be not reversed to the injury of his constituents. It can hardly escape notice that in his published *Works*, Webster has but two subsequent speeches in Congress on the tariff, both defending protection rather as a policy under which industries had been called into being than as an advisable policy, if the stage had been clear for the adoption of a new policy.

In 1827 Webster was sent to the senate, in which he remained until his death, with the exception of his service in the cabinet in Tyler's administration.[1] In January, 1830, came the crowning event of his political life. A debate on public lands, under a resolution offered by Senator Foote, thence known as "Foote's resolution," had wandered off into all possible fields. In course of it, Hayne, of South Carolina, attacked New England for having pursued a selfish policy as to western lands. Webster replied. During Hayne's answer Webster drew from him the first distinct and public statement of the new doctrine of nullification, of the constitutional right of a State to forbid the execution within its jurisdiction of Acts of Congress which it considered unconstitutional. This had been the product of Calhoun's intellect, which was generally taken to be the source of Hayne's inspiration. Webster's reply is his famous "second speech on Foote's resolution." He began by a defence of Massachusetts, which has been severely criticised, and is perhaps open to criticism. But if effect is to be taken as a test, it is above criticism. The remainder of the speech was of intense interest, not merely to New England, but to the whole North and West, and to all the progressive elements of the country. He stated the anarchistic doctrine of nullification in its nakedness, extorted from Hayne an unwilling half-admission of the exactness of his statement, and then went on to trample on it with such an exhibition of logic, sarcasm, and elephantine humor as has never been heard in the senate before or since. It is on this speech that Webster's fame was built. Southern men had taken the lead so long that it was a new sensation to the North and West to see a Southern leader completely overmatched by their champion; and "Black Dan Webster," a popular name, due to his dark complexion, beetling brows, and heavy cast of features, was for twenty years the representative of Northern sentiment as to the nature of the Union.

Calhoun took Hayne's place in the senate in 1833, introduced and defended resolutions endorsing the right of nullification, and was still more fully answered by Webster. For the next seventeen years the records of the senate are full of constitutional arguments between the two. Webster's oratory made him an invaluable member of the Whig party, and his addresses at political meetings are so numerous as to defy special mention. A leader so distinguished had a fair right to think of the presidency, but it always remained just beyond his reach. In the general Whig confusion of 1836 he received the fourteen electoral votes of Massachusetts. In 1840 the candidature of Harrison left him no chance. In 1844 Webster's retention of his position under Tyler gave Clay an overwhelming advantage with his party. In 1848 the nomination of Taylor, which Webster declared to be "one not fit to be made,"[2] was a fatal blow to the prospects of the Massachusetts leader. His final failure to obtain the Whig nomination in 1852 put an end to his political career.

When the Whig party came into power in 1841, Webster was appointed secretary of state (foreign affairs), and he retained his post under Tyler, after his colleagues had broken with the new president and resigned. There was good reason for his action. When he entered office war with Great Britain was a probable event of the near future. The McLeod case, in which the State of New York insisted on trying a British subject, with whose trial the Federal Government had no power to interfere, while the British Government had declared that it would consider conviction and execution a *casus belli;* the exercise of the right of search by British vessels on the coast of Africa, of which Americans had a deep-seated detestation, quite apart from any feeling about the slave-trade; the Maine boundary, as to which the action of a State might at any time bring the Federal Government into armed collision with Great Britain,—all these at once met the new secretary, and he felt that he had no right to abandon his work for party reasons. With the special commissioner from Great Britain, Lord Ashburton, he concluded the treaty of 1842, which settled all these questions satisfactorily to both parties. At the same time Webster took the opportunity to end the long controversy as to the right of impressment. Sixteen years afterwards the British Government admitted at last the correctness of the American position.

The treaty of 1842 also introduced the principle of extradition into the connection between the two countries. It had been admitted once before, in Jay's treaty of 1794, but only as to murder and forgery, and only until 1806.

Leaving the cabinet in 1843, Webster was returned to the senate in 1845 and spent the remainder of his life there.[3] He opposed the annexation of Texas and the Mexican War, and was, as before, the recognized spokesman of his party. As the growing intensity of the quarrel over the organization of the territory acquired from Mexico revealed the depth of the chasm which now yawned between the sections, Webster's standing-ground in American politics disappeared. His 7th of March speech, in 1850, which stamped him, in the opinion of many of his former Northern worshippers as a recreant bidding for Southern votes for the presidency, was really little different from his former words. It was the country that had changed. He was still for the Union as the one controlling consideration, with an equal dislike for the abolitionist and the secessionist, who endangered the Union. But the North and the South were already so far apart that not even Webster could stand with one foot in one and the other foot in the other section; and his fate was parallel with that of John Dickinson,[1] who essayed a similar rôle during the revolution. Angered at the spirit with which his speech was received, Webster threw all his influence towards driving through the Whig Convention of 1852 an endorsement of the compromise of 1850 "in all its parts," including, of course, the Fugitive Slave Act.[2] The result was his own failure to receive the Whig nomination for the presidency, and the downfall of his party. Just before the election he died at his home, Marshfield, Massachusetts, October, 1852.

---

[1] [He was appointed Secretary of State by President Harrison, and remained in Tyler's cabinet until 8th May, 1843, or eighteen months after his original colleagues had resigned. He re-entered the senate in 1845, and remained there until appointed Secretary of State by Fillmore, 20th July, 1850, in which office he died. Both his terms of Cabinet service were in administrations continued by Vice-Presidents whose policy was not in accord with the party electing them.—AM. ED.]

[2] [An expression of opinion uttered in a speech at Marshfield, 1st Sept., 1848.—AM. ED.]

[3] [See note 1, preceding column.—AM. ED.]

Webster was twice married—to Grace Fletcher, of New Hampshire, in 1808, and two years after her death to Catherine Bayard le Roy, of New York, in 1829. One of his sons, Edward, lost his life in the Mexican War;[3] his only surviving child, Fletcher Webster, colonel of a Massachusetts regiment, was killed at Bull Run. In marked contrast to Webster's wonderfully able treatment of public financial affairs, his management of his private finances was notoriously shiftless,—so much so that, in his later years, the care of them was assumed by a voluntary committee of Boston business men. Like many men of his time, he was neither careful nor temperate in table enjoyments. Washington people still tell of the enthusiasm with which, after dinner, he once insisted on standing up in a theatre-box, to join in the chorus of the American national hymn. He was a devoted angler, and intensely interested in scientific agriculture; much of his *Private Correspondence* is connected with the latter subject.

Webster named as his literary executors Edward Everett, C. C. Felton, George Ticknor, and George Ticknor Curtis. By this arrangement the standard edition of his *Works*, in six volumes, appeared (1851). In the first volume is a Life by Everett. See also Webster's *Private Correspondence*, Knapp's *Life of Webster* (1835), March's *Reminiscences of Congress* (1850), Lanman's *Private Life of Webster* (1856), Curtis's *Life of Webster* (1869), Harvey's *Reminiscences of Webster* (1877), Lodge's *Life of Webster* (1883). (A. J.)

WEBSTER, JOHN, the greatest of Shakespeare's contemporaries or successors, was a writer for the stage in the year 1601, and published in 1624 the city pageant for that year, "invented and written by John Webster, merchant-tailor." In the same year a tragedy by Ford and Webster was licensed for the stage; it is one of the numberless treasures now lost to us through the carelessness of genius or the malignity of chance. Beyond the period included between these two dates there are no traces to be found of his existence; nor is anything known of it with any certainty during that period, except that seven plays appeared with his name on the title page, three of them only the work of his unassisted hand. His first noteworthy appearance in print, as far as we know, was as the author of certain additions to Marston's tragi-comedy of *The Malcontent*; these probably do not extend beyond the induction, a curious and vivacious prelude to a powerful and irregular work of somewhat morbid and sardonic genius. Three years later, in 1607, two comedies and a tragedy, "written by Thomas Dekker and John Webster," were given to the press. The comedies are lively and humorous, full of movement and incident; but the beautiful interlude of poetry which distinguishes the second scene of the fourth act of *Westward Ho!* is unmistakably and unquestionably the work of Dekker; while the companion comedy of *Northward Ho!* is composed throughout of homespun and coarse-grained prose. *The Famous History of Sir Thomas Wyatt* is apparently a most awkward and injurious abridgment of a historical play in two parts on a pathetic but undramatic subject, the fate of Lady Jane Grey. In this lost play of *Lady Jane* Heywood, Chettle, and Smith had also taken part; so that even in its original form it can hardly have been other than a rough piece of patchwork. There are some touches of simple eloquence and rude dramatic ability in the mangled and corrupt residue which is all that survives of it; but on the whole this "history" is crude, meagre, and unimpressive. In 1612 John Webster stood revealed to the then somewhat narrow world of readers as a tragic poet and dramatist of the very foremost rank in the very highest class. *The White Devil*, also known as *Vittoria Corombona*, is a tragedy based on events then comparatively recent—on a chronicle of crime and retribution in which the leading circumstances were altered and adapted with the most delicate art and the most consummate judgment from the incompleteness of incomposite reality to the requisites of the stage of Shakespeare. By him alone among English poets have the finest scenes and passages of this tragedy been ever surpassed or equalled in the crowning qualities of tragic or dramatic poetry,—in pathos and passion, in subtlety and strength, in harmonious variety of art and infallible fidelity to nature. Eleven years had elapsed when the twin masterpiece of its author —if not indeed a still greater or more absolute masterpiece—was published by the poet who had given it to the stage seven years before. *The Duchess of Malfy* (an Anglicized version of Amalfi, corresponding to such designations as Florence, Venice, and Naples) was probably brought on the stage about the time of the death of Shakespeare; it was first printed in the memorable year which witnessed the first publication of his collected plays. This tragedy stands out among its compeers as one of the imperishable and ineradicable landmarks of literature. All the great qualities apparent in *The White Devil* reappear in *The Duchess of Malfy*, combined with a yet more perfect execution, and utilized with a yet more consummate skill. No poet has ever so long and so successfully sustained at their utmost height and intensity the expressed emotions and the united effects of terror and pity. The transcendent imagination and the impassioned sympathy which inspire this most tragic of all tragedies save *King Lear* are fused together in the fourth act into a creation which has hardly been excelled for unflagging energy of impression and of pathos in all the dramatic or poetic literature of the world. Its wild and fearful sublimity of invention is not more exceptional than the exquisite justice and tenderness and subtlety of its expression. Some of these executive merits may be found in an ill-constructed and ill-conditioned tragi-comedy which was printed in the same year; but few readers will care to remember much more of *The Devil's Law-Case* than the admirable scenes and passages which found favor in the unerring and untiring sight of Webster's first and final interpreter or commentator, Charles Lamb. Thirty-one years later the noble tragedy of *Appius and Virginia* was given to the world,—a work which would alone have sufficed to perpetuate the memory of its author among all competent lovers of English poetry at its best. Seven years afterwards an unprincipled and ignorant bookseller published, under the title of *A Cure for a Cuckold*, a play of which he assigned the authorship to John Webster and William Rowley. This attribution may or may not be accurate; the play is a mixture of coarsely realistic farce and gracefully romantic comedy. An elegy on Henry, prince of Wales, and a few slight occasional verses, compose the rest of Webster's remaining works.

---

[1] [John Dickinson (1732-1808) refused to sign the Declaration of Independence because he thought it unwise to complete the breach with Great Britain until some guarantees of national existence had been obtained. But he afterwards served zealously in the revolutionary army both as a private and as a brigadier, also in the Continental Congress, and as president successively of Delaware and Pennsylvania. He contributed to the formation and adoption of the Federal Constitution, and in his political career there was no issue between Northern and Southern States, but rather between the greater and smaller ones, and the nature of a federated government.—AM. ED.]

[2] [His last speech was upon the Compromise Measures of 17th July, 1850, and closed with the words, "No man can suffer too much and no man can fall too soon, if he suffer or if he fall in defence of the liberties and Constitution of his country."—AM. ED.]

[3] [He had served in this war, but he died at San Angel, Mexico, of typhoid fever, and with the rank of major of Massachusetts volunteers.—AM. ED.]

Webster's claims to a place among the chief writers of his country were ignored for upwards of two centuries. In 1830 the Rev. Alexander Dyce first collected and edited the works of a poet who had found his first adequate recognition twenty-two years earlier at the pious and fortunate hands of Lamb. But we cannot imagine that a presentiment or even a foreknowledge of this long delay in the payment of a debt so long due from his countrymen to the memory of so great a poet would seriously have disturbed or distressed the mind of the man who has given us the clue to his nature in a single and an imperishable sentence—"I rest silent in my own work." (A. C. S.)

WEBSTER, Noah (1758–1843), American lexicographer, was descended on the father's side from John Webster of Warwickshire, England, one of the original settlers at Hartford, and for a time governor of Connecticut, and on the mother's side from William Bradford, second governor of Plymouth and one of the founders of that colony. He was the son of a farmer, and was born in West Hartford, Connecticut, 16th October, 1758. In his early years he was engaged in agricultural work, but attended a district school in the winter, and when fourteen years of age began the study of the classics under the Rev. Nathan Perkins, D.D. He entered the freshman's class at Yale College in 1774, and while in his junior year there he took part as a volunteer in the expedition against General Burgoyne. After graduating in 1778 he supported himself by teaching while prosecuting the study of law. Having begun at this time to note down every word whose meaning he did not properly understand, he was first led to conceive the scheme of a new dictionary from his frequent inability to find proper definitions of words in those in current use. His experience as a teacher soon convinced him also of the need of better instruction books in English, and this he endeavored to supply by his *Grammatical Institute of the English Language*, the first part of which appeared in 1783, and a second and third part in the following years. It comprehended a spelling-book, English grammar, and compilation of English reading, and very soon found a place in most of the schools of the United States. In 1785 he prepared a course of lectures on the English language, which he delivered in the principal American cities, and published in 1789 under the title *Dissertations on the English Language*. Meanwhile he also continued to take a deep interest in all prominent political questions. In his *Sketches of American Policy* (1784) he made the first distinct proposal for a new constitution for the United States, and when the work of the commissioners was completed in 1787 he was asked by them to recommend the new constitution to the American people, which he did in an *Examination of the Leading Principles of the Federal Constitution*. After his marriage in 1789 he established himself in the practice of law at Hartford. In 1793 he was induced to found at New York a paper called *Minerva*, with which was connected the *Herald*, a semiweekly; the titles of the papers were subsequently altered respectively to the *Commercial Advertiser* and the *New York Spectator*. In 1795 he contributed to his paper several articles, under the signature of Curtius, in vindication of Jay's treaty with Great Britain, which were reprinted and had considerable effect in allaying opposition to it. In 1798 he removed to New Haven, which town he was chosen soon afterwards to represent in the general assembly of Connecticut. In 1802 appeared his well-known treatise on *The Rights of Neutrals*. Having removed in 1812 to Amherst, he took there a leading part in the establishment of the academy and then of the college, of which he was chosen the first president. He also represented Amherst in the court[1] of Massachusetts. In 1822 he returned to New Haven. Meanwhile his lexicographical studies, though much interrupted by his professional and political duties, had never been entirely suspended. In 1806 he published his *Compendious Dictionary of the English Language*, but this was only preparatory to a larger work. In 1824 he sailed for Europe to complete his researches, and after spending some time in Paris continued his labors in the library at Cambridge, where he finished the dictionary. It was published in 1828 and a second edition with many additions appeared in 1841. He also completed the revision of an appendix a few days before his death, which took place 20th[2] May, 1843.

In 1833 Webster published an edition of the Bible, "with amendments of the language," and again in 1839 an edition of the New Testament. In early life he wrote a *History of the United States*, of which a revised edition appeared in 1839. He was also the author of *Historical Notices of Banking Institutions and Insurance Companies* (1802), and a *Collection of Papers on Political and Literary Subjects* (1843). Since his death several revised and enlarged editions of the *Dictionary* have appeared. It was the result of much labor and research, and on this account, as well as for the clearness and carefulness of its definitions, it still holds a leading place among dictionaries of the English language, especially in America. A biography of Webster, by C. A. Goodrich, D.D., is prefixed to the quarto editions of the *Dictionary*.[3]

WEBSTER, Thomas (1800–1886), figure painter, was born at Ranelagh Street, Pimlico, London, on March 20, 1800. His father was a member of the household of George III.; and the son, having shown an aptitude for music, became a chorister in the Chapel Royal, St. James's. He, however, developed a still stronger love for painting, and in 1821 he was admitted student of the Royal Academy, to whose exhibition he contributed, in 1824, portraits of Mrs. Robinson and Family. In the following year he gained the first medal in the school of painting. Till 1879 he continued to exhibit in the Royal Academy work of a genial and gently humorous character, dealing commonly with subjects of familiar incident, and especially of child life. Many of these were exceedingly popular, particularly his Punch (1840), which procured in 1841 his election as A.R.A., followed five years later by full membership. He became an honorary retired academician in 1877, and died at Cranbrook, Kent, on September 23, 1886. His Going into School, or the Truant (1836), and his Dame's School (1845) are in the National Gallery, and five of his works are in the South Kensington Museum. Many of his paintings have been transcribed by Lumb Stocks, A.R.A., and others of the best engravers of the time.

WEDDERBURN, Alexander (1733–1805), Baron Loughborough in 1780, earl of Rosslyn in 1801, lord high chancellor of Great Britain, was the eldest son of Peter Wedderburn (a lord of session as Lord Chesterhall), and was born in East Lothian on 13th February, 1733. He acquired the rudiments of his education at Dalkeith, and in his fourteenth year was sent to the university of Edinburgh, where he matriculated on 18th March, 1746. It was from the first his desire to practice at the English bar, though in deference to his father's wishes he qualified as an advocate at Edinburgh on 29th June, 1754, and he did not neglect to enter himself at the Inner Temple on 8th May, 1753, so that he might keep the Easter and Trinity terms in that year. His father was called to the bench in 1755, and for the next three years Wedderburn stuck to his practice in Edinburgh, during which period he zealously, with an eye to the main chance, employed his oratorical powers in the General Assembly of the Church of Scotland, and passed his evenings in the social and argumentative clubs which abound in its capital. In 1755 a short-lived precursor of the more famous *Edinburgh Review* of a later generation was started in Edinburgh, and it is chiefly remembered now from the circumstance that in its pages Adam Smith criticised the dictionary of Dr. Johnson, and that the contents of its two numbers were edited by Wedderburn. The dean of faculty at this time, Lockhart, afterwards Lord Covington, a lawyer notorious for his harsh demeanor, in the autumn of 1757 assailed Wedderburn with more than ordinary insolence. His victim retorted with extraordinary powers of invective, and on being rebuked by the bench declined to retract or apologize, but placed his gown upon the table, and with a low bow left the court forever. It was long supposed that this step was unpremeditated, but it is now believed that the altercation only made him act upon his previous decision of quitting the Scottish for the English courts. Through his prudence in having taken the preliminary steps some years previously he was called to the English bar at the Inner Temple on 25th November, 1757. In his new position he acted with characteristic energy. To shake off his native accent and to acquire the graces of oratorical action, he engaged the services of Sheridan and Macklin. To secure business and to conduct his cases with adequate knowledge, he diligently studied the forms of English law, he solicited Strahan, the printer, "to get him employed in city causes," and he entered into social intercourse (as is noted in Alexander Carlyle's autobiography) with busy London solicitors, such as the brothers Dagge. His local connections and the incidents of his previous career introduced him to the notice of his countrymen Lords Bute and Mansfield. When Bute was prime minister this legal satellite used, says Dr. Johnson, to go on errands for him, and it is to Wedderburn's credit that he first suggested to the premier the propriety of granting Johnson a pension. Through the favor of the royal favorite he was returned to parliament (28th December, 1761) for the Ayr burghs, and in consequence of the same patronage he was introduced into Churchill's *Rosciad* as "a pert prim prater," conspicuous for "guilt in his heart and famine in his face." In 1763 he became king's counsel and bencher of Lincoln's Inn, and for a short time went the northern circuits, but was more successful in obtaining business in the Court of Chancery. He obtained a considerable addition to his resources (Carlyle puts the amount at £10,000) [$48,600] on his marriage (31st December, 1767) to Betty Anne, sole child and heiress of John Dawson, of Marly in Yorkshire. When George Grenville, whose principles leaned to Toryism, quarrelled with the court, Wedderburn affected to regard him as his leader in politics. At the dissolution in the spring of 1768 he was returned by Sir Lawrence Dundas for Richmond as a Tory, but in the struggles over Wilkes he took the popular side of "Wilkes and liberty," and resigned his seat (May, 1769). In the opinion of the people he was now regarded as the embodiment of all legal virtue; his health was toasted at the dinners of the Whigs amid rounds of applause, and, in recompense for the loss of his seat in parliament, he was returned by Lord Clive for his pocket-borough of Bishop's Castle, in Shropshire (January, 1770). During the next session he acted vigorously in opposition, but his conduct was always viewed with distrust by his new associates, and his attacks on the ministry of Lord North grew less and less animated in proportion to its apparent fixity of tenure. In January, 1771, he was offered and accepted the prize of solicitor-general. The high road to the woolsack was now open to his steps, but his defection from his former path has stamped his character with general infamy. Junius wrote of him—"As for Mr. Wedderburn, there is something about him which even treachery cannot trust," and Colonel Barré attacked him in the House of Commons. The new law officer defended his conduct with the assertion that his alliance in politics had been with Mr. George Grenville, and that the connection had been severed on his death. In his new position his services were warmly appreciated. He was cool and ready in debate, and when his advice was sought for the deliberation of the cabinet it was given with promptness and energy. The expression of Gibbon that Lord North "was upholden on either hand by the majestic sense of Thurlow and the skilful eloquence of Wedderburn" was not overstrained. All through the lengthened folly of the American War his declamation was consistently employed against the cause of the colonies, but one incident in his conduct is indelibly written in history. Dr. Franklin obtained in 1773, by means of some unknown member of parliament, certain letters from crown officials in Massachusetts, written before the outbreak of hostilities,[1] and recommending the employment of a military force for the suppression of the discontent which prevailed in America. These letters he sent to the speaker of the house of assembly, and that body thereupon prayed for the recall of the officials. The application came before a committee of the privy council, when Wedderburn, amid the unrestrained applause of the majority of the judges, denounced Franklin in unmeasured terms, comparing "the coolness and apathy of the wily New Englander" with the "revengeful temper of the negro Zanga" in Dr. Young's play of the *Revenge*. His victim preserved an impassive demeanor, but was cut to the quick. Years afterwards, on the termination of the war, when articles of peace were signed at Versailles—this is the usually accepted version of a story on which some doubt has been cast—Franklin wore the same clothes which he had worn when exposed to this invective. In June, 1778, Wedderburn was promoted to the post of attorney-general, and in the same year he refused the dignity of chief baron of the exchequer because the offer was not accompanied by the promise of a peerage. At the dissolution in 1774 he had been returned for Okehampton in Devonshire, and for Castle Rising in Norfolk, and selected the former constituency; on his promotion as leading law officer of the crown he returned to his old love of Bishop's Castle. The coveted peerage was not long delayed. In June, 1780, he was created chief justice of the Court of Common Pleas, and he was at the same time gratified by the title of Baron Loughborough. For thirteen years he presided over this court, and, although his knowledge of the principles and precedents of law was always deficient, his skill in marshalling his facts and his clearness of diction made his appointment generally acceptable.

---

[1] [That is the legislature or general court.—AM. ED.]

[2] [Died 28th May. See *memoir* in the *Dictionary*.—AM. ED.]

[3] [The children of Noah Webster were one son, William G. Webster, one of the editors of the revised edition of the Dictionary known as the Unabridged, and six daughters, of whom the eldest was married to Governor William W. Ellsworth (1791–1868); the second to Professor Chauncey A. Goodrich, the principal reviser of the Dictionary (1790–1860); the third to Edward Cobb, of Portland, Maine, and afterwards to Professor William Chauncey Fowler, editor of the University edition of Webster's Dictionary (1793–1881).—AM. ED.]

During the existence of the coalition ministry of North and Fox, the great seal was in commission (April to December, 1783), and Lord Loughborough held the leading place among the commissioners. For some time after its fall he was considered as the leader of the Whig party in the House of Lords, and, had the illness of the king brought about the return of the Whigs to power, the great seal would have been placed in his hands. The king's restoration to health secured Pitt's continuance in office, and disappointed the expectations of the Whigs. In 1792, during the period of the French Revolution, Lord Loughborough seceded from Fox, and on the 28th January, 1793, he received the great seal in the Tory cabinet of Pitt. In legal knowledge he was exceeded by many of his predecessors, but his judgments were always remarkable for their perspicuity, and in the appeal cases to the House of Lords, where it was his function to criticise and elucidate the opinions of others, he shone pre-eminent. All the political acts of the administration in which he served met with his zealous support, and he remained faithful to his leader until the question of Catholic emancipation became of urgent importance, when he is supposed to have influenced by unfair means the mind of his sovereign. It was probably through his advice that George III. refused his assent to Pitt's proposals, and that the removal of the disabilities under which the Catholics groaned was delayed for another quarter of a century. When the prime minister found that he could not carry out his compact with his Catholic fellow-subjects he resigned, and Addington succeeded to his place. Much to Lord Loughborough's surprise, no place was found for him in Addington's cabinet, and he was obliged to resign his post of lord chancellor (14th April, 1801). His first wife died 15th February, 1781, without leaving issue, and he married in the following year (12th September) Charlotte, youngest daughter of William, Viscount Courtenay, but her only son died in childhood. Lord Loughborough accordingly obtained in 1795 a re-grant of his barony with remainder to his nephew, Sir James St. Clair Erskine. His fall in 1801 was softened by the grant of an earldom (he was created earl of Rosslyn 21st April, 1801, with remainder to his nephew), and by a pension of £4000 [$19,440] per annum. After this date he rarely appeared in public, but he was a constant figure at all the royal festivities. He attended one of those gatherings at Frogmore, 31st December, 1804. On the following day he was seized with an attack of gout in the stomach, and on 2d January, 1805, he died at his seat, Baylis, near Salt Hill, Windsor. His remains were buried in St. Paul's Cathedral on the 11th January.

---

[1] [The statement is unimpeachable that letters obtained in 1773 were written before the outbreak of hostilities in 1775.—AM. ED.]

At the bar Wedderburn was the most elegant speaker of his time, but in legal erudition he was excelled by many of his contemporaries, and he is said to have been markedly afraid of Dunning's forensic powers. For cool and sustained declamation he stood unrivalled in parliament, and his readiness in debate was universally acknowledged. In social life, in the company of the wits and writers of his day, his faculties seemed to desert him. He was not only dull but the cause of dulness in others, and even Alexander Carlyle confesses that in conversation his illustrious countryman was "stiff and pompous." In Wedderburn's character ambition banished all rectitude of principle, but the love of money for money's sake was not among his faults. (W. P. C.)

WEDGWOOD, Josiah (1730–1795), the most distinguished of English manufacturers of pottery. Many members of the Wedgwood family had been established as potters in Staffordshire throughout the 17th century, but their productions were in no way remarkable. Josiah, born in 1730, was the youngest child of Thomas Wedgwood, who owned a thriving pottery in Burslem. At a very early age he distinguished himself by keen powers of observation and love for all that was curious and beautiful. Soon after the death of his father in 1739, Josiah, then scarcely ten years of age, was taken away from school and set to learn the art of moulding or "throwing" clay pottery, at which he soon became extraordinarily skilful. In 1744 he was apprenticed to his eldest brother, who had succeeded to the management of his father's pottery, and in 1751, when the term of his apprenticeship had expired, Josiah Wedgwood became manager of the neighboring Alder pottery, with a very moderate salary. In 1759 he started as an independent potter at the Ivy-House works in Burslem, and soon introduced many improvements among the simple classes of pottery which were then made in Staffordshire. Soon, however, Wedgwood's tastes were turned in an archæological direction by the increasing interest then taken in Greek or (as they were then called) Etruscan vases. His enthusiasm was specially aroused by the illustrations in Comte de Caylus's *Recueil d'Antiquités* (1752–67); aided by this work he began to attempt to copy Greek designs, and in later years he was further assisted by loans of vases from the fine collection of Greek pottery possessed by Sir William Hamilton. In 1769 Wedgwood opened new potteries on a larger scale at Etruria in Staffordshire, having entered into partnership with Thomas Bentley of Liverpool, a man of great taste and culture, and in all respects a kindred spirit. Many able artists, and among them the young Flaxman, were engaged to design and model reliefs, busts, and other designs for the Wedgwood and Bentley pottery; and in a short time the productions of their kilns were widely sold and highly esteemed in all the chief countries of Europe. After Bentley's death in 1780, Wedgwood became sole owner of the Etruria pottery till 1790, when he took some of his sons into partnership. His chief artistic feat was perhaps the production of an accurate copy in clay of the celebrated glass Portland vase; reproductions of this were sold at £50 ($243) a piece, and about 50 copies—not all of equal merit—were produced during Wedgwood's lifetime. In 1764 Josiah married his cousin Sarah Wedgwood. He died on January 3, 1795, in the 65th year of his age, leaving to his children a well-earned fortune of more than half a million.

Josiah Wedgwood was a man of the highest moral worth and skilled in many branches of knowledge. He was the intimate friend of Dr. Erasmus Darwin and other distinguished men of science. For the chief characteristics of the Wedgwood pottery the reader is referred to the article Pottery, vol. xix. p. 652. See also Jewitt, *Life of Wedgwood*, 1865; and Eliza Meteyard, *Life of Wedgwood*, 1st ed., 1865–66.

WEDNESBURY, a market-town and parliamentary borough of Staffordshire, England, is situated near the source of the Tame, on the Great Western and London and Northwestern railway lines, 8 miles northwest of Birmingham, and 136½ miles northwest of London. The church of St. Bartholomew, a fine building in the Perpendicular style, is supposed to occupy the site of a heathen temple to Woden, and some remains of the ancient castle adjoin it. The church was erected probably in the 11th century, and from 1301 the advowson, tithes, etc., belonged to the abbot of Halesowen until 1535. It was partially rebuilt towards the close of the 15th century, and restored in 1766, in 1827, in 1878, and in 1885. Among other public buildings are the town-hall (1871–72), the free library in the Gothic style (1878), containing about 9000 volumes, the Liberal club (1875), the assembly rooms, the public baths, and the temperance hall. The neighborhood of Wednesbury has been long celebrated for its iron and coal mines, the coal being unequalled as fuel for the smith's forge. A special kind of iron ore is obtained which is manufactured into axes and other edge-tools. The town possesses large steel and iron works, the more important manufactures being those of the large kind of iron work used by railway companies (such as bridges, cranes, switches, roofs, wheels, axletrees, boiler-plates, and rails), water, steam, and gas pipes, and various kinds of wrought-iron work. The population of the urban sanitary district (area 2124 acres), which is identical with the township, in 1871 was 25,030, and in 1881 it was 24,566. In 1811 the population was only 5372. Until 1885 the parliamentary borough had an area of 11,340 acres, with a population in 1871 of 116,809 and in 1881 of 124,437. West Bromwich, formerly included in it, has been erected into a separate borough, leaving in Wednesbury an area which in 1881 had a population of 68,142.

At Wednesbury (Wodensborough), Ethelfleda, widow of Ethelred of Mercia, in 916 constructed a castle. The place is not mentioned in Domesday, but appears to have belonged to the barony of Dudley. After the Conquest it became a demesne of the crown, and it was bestowed by Henry II. on the Heronvilles. It first received parliamentary representation in 1867.

WEEK. See Calendar and Sabbath.

WEEVER. The weevers (*Trachinus*) are small marine fishes which are common on the coasts of

Europe, and which have attained notoriety from the painful and sometimes dangerous wounds they are able to inflict upon those who incautiously handle them. They belong to a family of spiny-rayed fishes (*Trachinidæ*), and are distinguished by a long low body with two dorsal fins, the anterior of which is composed of six or seven spines only, the posterior being long and many-rayed; their anal resembles in form and composition the second dorsal fin. The ventral fins are placed in advance of the pectorals, and consist of a spine and five rays. The caudal fin has the hind margin not excised. The body is covered with very small scales, sunk in and firmly adherent to the skin, but the upper surface of the head is bony, without integument. The head, like the body, is compressed, with the eyes of moderate size and placed on the side of the head; the mouth is wide, oblique, and armed with bands of very small teeth.

Several species of weevers are known, but two only occur on the British coasts, viz., the Greater Weever (*Trachinus draco*) and the Lesser Weever (*T. vipera*); the former is frequently found of a length of 12 inches, and possesses some thirty rays in the second dorsal fin, whilst the latter grows only to about half that length, and has about ten rays less in the dorsal. The coloration of both is plain, but the short first dorsal fin is always of a deep black color. The weevers are bottom fish, burying and hiding themselves in the sand or between shingle,—the lesser species living close inshore and the greater preferring deeper water, and being found sometimes floating on the surface at a distance of several miles from the shore. Although weevers, especially the lesser, are in the habit of burying themselves in the sand, and are abundant in some localities much resorted to by bathers, accidents from stepping upon them are much more rare than from incautiously handling them after capture. They probably make their escape on perceiving the approach of a person. The wounds are inflicted by the dorsal and opercular spines, are very painful, and sometimes cause violent local inflammation. In the absence of any special poison organ it is most probable that the mucous secretion in the vicinity of the spines has poisonous properties. The spines are deeply grooved, the poisonous fluid which is lodged in the grooves being thus introduced into the punctured wound.

WEEVIL, a very old Anglo-Saxon term, now commonly applied to the members of a group of *Coleoptera* termed the *Rhyncophora* (see vol. vi. p. 120). This group is characterized by the prolongation of the head into a rostrum or proboscis, at the end of which the mouth, with its appendages, is placed. The antennæ are short, usually elbowed, and often end in a club-shaped swelling. The basal portion of the antennæ frequently lies in a depression at the side of the rostrum, and this gives the antennæ the appearance of emerging half-way along the rostrum. The mouth appendages are small; the mandibles, however, are stout. The palps are very short and conical as a rule. The body is usually small; in shape it varies very much. The elytra are very hard, and in some cases fused with one another, rendering flight impossible. The larvæ are white, fleshy, apodal grubs, with a series of tubercles along each side of the body; the head is round, and bears strong jaws, and sometimes rudimentary ocelli. They are exclusively phytophagous. The *Rhyncophora* embrace three families,—(1) the *Curculionidæ*, or true weevils, (2) the *Brenthidæ*, and (3) the *Bruchidæ*.

The *Curculionidæ* form one of the largest families amongst the *Coleoptera*, the number of species described exceeding 10,000, arranged in 1150 genera. The antennæ are elbowed, and clavate, with the basal portion inserted in a groove. The third tarsal joint is generally bilobed. Over 400 species exist in Great Britain, few of which exceed half an inch in length. The genera *Phyllobius* and *Polydrosus* include some of the most beautiful insects found in Britain—their brilliancy, like that of the *Lepidoptera*, being due to the presence of microscopic scales. The diamond beetle of South America, *Entimus imperialis*, is another singularly beautiful weevil; its color is black, studded with spangles of golden green. The immense family of the *Curculionidæ* includes members which differ greatly from one another in size, color, and appearance; even the rostrum, the most striking common characteristic, varies greatly. The form of the body is very various: some are rounded or oval, others elongated, almost linear; some are covered with warty protuberances, whilst others are smooth and shining, often with a metallic lustre.

One of the commonest members of this family in Great Britain is the Nut Weevil, *Balaninus nucum*. It is of a brownish color, varied with yellow, the legs reddish. Its rostrum is unusually long, being five-sixths of the body length in the female, and slightly shorter in the male. The antennæ are 7-jointed. The first three joints are much longer than thick; the four following are shorter, and the seventh not longer than thick. The larva is very common in hazel nuts and filberts. When the nuts are about half-grown, the female bores, with its rostrum, a minute hole in the still comparatively soft nut shell, and deposits an egg within the nut. The egg is said to be pushed in by means of the long rostrum. As the nut grows the slight puncture becomes almost obliterated, so that it is unnoticed by all but the most observant eye. The larva is a thick white grub with a brownish head, bearing fleshy tubercles along its side. It feeds upon the substance of the nut. The nuts which are infested by this insect are usually the first to fall to the ground; the larva then bores a round hole through the nut shell, by means of its jaws, and creeps out. It hides itself in the ground during the winter, and in the spring it passes into the pupa stage, from which it emerges about August as the full-grown insect. A nearly allied form, *Balaninus glandium*, attacks both hazel nuts and acorns.

2. The same, natural size.
3. The larva, magnified.
4. The same, natural size.
5. Head and snout of the female, magnified.
6. The same parts of the male, magnified, to show arrangement of antennæ.

In an unobtrusive way weevils do immense harm to vegetation. This is effected not so much by their numbers and their powers of consumption, as amongst caterpillars, but by their habits of attacking the essential parts of a plant, and causing by their injuries the death of the plant affected. They destroy the young buds, shoots, and fruits, and attack the young plants in their most delicate organs. Many of them devour seed, as the Corn Weevils, *Calandra granaria* (see WHEAT) and *C. oryzæ*, and in this way vegetation is severely injured, and its spread seriously checked. Others cause much damage in forests, by boring under the bark and through the wood of trees, whilst some even burrow in the tissue of the leaves.

The *Brenthidæ* are by some authorities included in the family *Curculionidæ*. They include some 275 species, and are almost exclusively tropical. Their antennæ are 11-jointed, not elbowed. The rostrum is straight and very long. The shape of the body is very long and narrow, the first and second abdominal segment being very long. Allied to these is the subfamily *Attelabides*.

The *Bruchidæ* form a somewhat larger family than the foregoing, containing over 400 species. The antennæ are straight, and inserted upon the head just in front of the eyes; they are 11-jointed, and serrated or toothed in the inside. The rostrum is short. *Bruchus pisi* causes considerable damage to pease; during the spring the beetle lays its eggs in the young pea, which is devoured by the larva which hatches out in it. (A. E. S.)

WEIGHING MACHINES. See BALANCE; also MECHANICS (vol. xv. pp. 781–2) and MINT (vol. xvi. pp. 513–14).

WEIGHTS AND MEASURES.

THIS subject may be best divided for convenience of reference into three parts: I. SCIENTIFIC, including the facts and data usually needed for scientific reference; II. HISTORICAL, including the principles of research and results in ancient metrology; and III. COMMERCIAL, including the weights and measures of modern countries as used in commerce.

I. SCIENTIFIC.

A unit of length is the distance between two points defined by some natural or artificial standard, or a multiple of that. For instance, in Britain the unit of the yard is defined by the distance between two parallel lines on gold studs sunk in a bar of bronze, when at 62° F., which bar is preserved in the Standards Office. There are other units, such as the inch, foot, mile, etc.; but, as these are aliquot parts or multiples of the yard, there is no separate standard provided for them. A unit is an abstract quantity, represented by a certain standard, and more or less perfectly by copies of the standard.

A unit of mass is the matter of a standard of mass, or a multiple of that. For instance, in Britain the unit of the pound is defined by a piece of platinum preserved in the Standards Office.

A unit of weight is the attractive force exerted between a unit of mass and some given body at a fixed distance,—this force being the weight of the unit in relation to the given body, or any other body of equal mass.[1] Usually the given body is the earth, and the distance a radius of the earth. For instance, the unit of weight in Britain is the attraction between the earth and the standard pound when that is placed at sea-level at London, in a vacuum. For astronomical comparisons the unit of mass is the sun, and a unit of weight is not needed.

Standards of length are all defined on metal bars at present in civilized countries. Various natural standards have been proposed, such as the length of the polar diameter of the earth (inch), the circumference of the earth (metre) in a given longitude, a pendulum vibrating in one second at a fixed distance from the earth, a wave of light emitted by an incandescent gas, etc. But the difficulty of ascertaining the exact value of these lengths prevents any material standard being based upon them with the amount of accuracy that actual measurements, to be taken from the standard, require. A natural standard is therefore only a matter of sentiment.

Standards of length are of two types, the defining points being either at a certain part of two parallel lines engraven in one plane (a line-standard), or else points on two parallel surfaces, which can only be observed by contact (an end-standard). The first type is always used for accurate purposes. Units of surface are always directly related to standards of length, without any separate standards. Volume is either determined by the lineal dimensions of a space or a solid, or, for accurate purposes, by the mass of water contained in a volume at a given temperature, which again is measured either by liquid measure, or, more accurately, by weight. The standard of volume in Britain is a hollow cylinder of bronze, with a plate glass cover, when at 62° (gallon), legally defined as 277.274 cubic inches, or containing 10 pounds of water at 62° F.

Comparisons.—Lengths nearly equal are compared accurately by fixing two micrometer microscopes with their axes parallel, and at the required distance apart, on a massive support which will not quickly vary with temperature; then the two lengths to be compared, *e.g.*, the standard yard and another, are alternately placed beneath the microscopes, and their lengths observed several times. The error of a single observation in the Standards Department is stated to be a 100,000th of an inch. For fractional lengths a divided bar is required, the accuracy of which is ascertained by a shorter measure, which can be compared with successive sections of the whole length by micrometers. For ordinary purposes, where not less than .001 inch is to be observed, measures may be placed in contact if one is divided on the edge, and the comparison made with a magnifier. In large field work the ends of a measure are transferred vertically to the ground by a small transit instrument or theodolite. End-measures between surfaces are read by means of a pair of contact pieces bearing line marks, the value of which is ascertained separately, or by a second end-measure; if both measures bear a line for observation, reversals then give the value of each measure.

Volumes are always most accurately defined by their weight of water, as weighing can be more accurately done than measuring. If the volume is hollow, it may be filled with water and closed with a sheet of plate glass, or if solid the body may be weighed in water and out, the difference giving the weight of its volume of water. Unfortunately the relation between water-weight and absolute volume is not yet accurately known. Volumes of liquid are similarly ascertained by their weight. Volumes of gas are measured in a graduated glass vessel inverted over a liquid, or for commercial purposes by some form of registering flow-meter.

Masses are compared by the BALANCE (*q.v.*), which may be made to indicate a 100,000,000th of the mass. They may also be estimated, not by their attractive force being balanced by an equal mass, but by the elasticity of a spring; this, which is the only true weighing-machine showing weight and not mass, is useful for rough purposes, owing to its quick indication; the most accurate form probably is that with angular readings.[2]

Temperature and the Atmosphere.—All the serious difficulties of weighing and measuring result from these causes, the effects of which and their corrections we will briefly notice. In measurement, since all bodies expand by heat, the temperature at which any measure or standard bar represents the abstract unit requires to be accurately stated and observed, the accuracy of optical observation being about equal to $\frac{1}{100}$ of a degree F. of expansion in a standard. Great accuracy is therefore needed in the manufacture and reading of thermometers, and care that the standard and the thermometer shall be at the same temperature. Another method is to attach a parallel bar of very expansible metal to one end of the standard, and read its length on the standard at the other end; this ensures a more thorough uniformity of mean temperature between the standard and the heat measurer. The most accurate method is by immersing the measures in a liquid, of which the temperature is read by several thermometers; but this is scarcely needful unless high or low temperatures are required to ascertain the rate of expansion. A room with thick walls, double windows, and the temperature regulated by a gas stove is practically sufficiently equable for comparisons.

The temperature adopted for the standards is not the same in different countries. In Britain 62° F. has been adopted since the revision of the standards in 1822 as being a convenient average temperature for work; but, as it is purely a temperature of convenience, the rather higher point of 68° F. would be better. In any case an aliquot part of the thermal unit from freezing to boiling of water should be adopted; 62° is ⅙ and 68° is ⅕ of this interval. Whether a much higher temperature would not be more conducive to accuracy is a question; 92°, or ⅓ of the thermal unit, would be so near the temperature of the observer's skin and breath that measures and balances could be approached with less production of error; and such a heat does not at all hinder accurate observing. The French temperature of 32° F. for standards has abandoned all other considerations in favor of readily fixing the temperature in practice by melting ice. This is a ready means of regulation, but a point so far from ordinary working temperatures has two great disadvantages: the observer's warmth produces more error, and the corrections for all observations not iced are so large that the rates of expansion require to be known very accurately for every substance employed. For water their standard temperature is 39.2° F., when it is at its maximum density; this has the advantage that the density varies less with temperature than at any other point, but it is very doubtful if this is much used for actual work.

---

[1] The word weight has in common use two meanings,—(1) the force exerted between the earth and a body, and (2) a mass which is weighed against other bodies. In scientific use, however, weight means only a property of matter by which it is most convenient to compare the relative amounts of masses.

[2] See *Nature*, xxx. 205.

No substance expands uniformly with temperature, most materials expanding more rapidly at higher temperatures. The expansion of rods of the following metals, of 100 inches long, is given in decimals of an inch for the 90° from 32° to 122° F. (0 to 50° C.), and from 122° to 212° F. (50° to 100° C.):[1]

	Platinum.	Platino-iridium.	Steel.	Iron.	Bronze.	Brass.	Zinc.
32° to 122°	.0445	.0435	.0536	.0591	.0876	.0915	.1469
122° to 212°	.0471	.0454	.0574	.0637	.0927	.0964	.1437

But variations of 3 or 4 per cent. may easily be found in the rates of different specimens apparently alike; hence the individual expansion of every important measure needs to be ascertained.

Weighing is complicated by being done in a dense and variable atmosphere, unless—as in the most refined work—the whole balance is placed in a vacuum. When in the air all bodies placed in the balance must, for accurate purposes, have their volume known; and the weight of an equal volume of such air as they are weighed in must be added to their apparent weight to get their true weight. The weight of air displaced by a pound of the following materials is given in grains at temperature 62° F., barometer 30 inches,—also with barometer 29 inches (temperature 62°), and with temperature 32° (barometer 30 inches), to illustrate the variation[2] (allowing for contraction of the material as well):

	Platinum.	Brass.	Gilt Bronze.	Iron, with Lead Adjustment.	Quartz.	Glass.	Water.
Sp. Gr.	21.157	8.143	8.283	7.127	2.650	2.518	1.000
62°, 30	.403	1.047	1.029	1.196	3.217	3.385	8.523
62°, 29	.390	1.012	.995	1.156	3.110	3.272	8.240
32°, 30	.429	1.112	1.093	1.271	3.422	3.600	9.056

The above is for London at sea-level; but where the force of gravity is less 30 inches height of mercury will weigh less, and will therefore balance a less weight of air; the air allowance must therefore be less for 30 inches of mercury barometer in lower latitudes and greater heights over sea-level. The change, for instance, in the allowance of air equal to the brass pound will make it, instead of 1.047 grains, become 1.046 when 15,000 feet above the sea, or 10° S. of London. Hence this reduction need rarely be noticed. The composition of the air also varies, and most seriously in the amount of aqueous vapor; the above is ordinary air, but if quite dry the 1.047 grains would become 1.052 grains; the change in carbonic acid is quite immaterial, unless in very close rooms, so that it may be concluded that the moisture of the air is the main point to be noted, after its temperature and pressure,—small errors in any of these three data making far more difference than any other compensation that can be made in the weight of air.

The more complex allowances for the expansion of water in glass, brass, or other vessels we need not enter on here; the principles are simple, but the data require to be accurately determined for the material in question. The expansion of water is, however, so often in question, especially for taking specific gravities, that it is here given. A constant volume which contains or displaces 10,000 grains of water at 62° will contain[3]—

At 32° F. (0° C.),	10,009.84 grains	At 62° F. (16⅔° C.),	10,000.00 gr.
" 39.2° F. (4° C.),	10,011.20 "	" 68° F. (20° C.),	9,993.76 "
" 50° F. (10° C.),	10,008.89 "	" 86° F. (30° C.),	9,968.76 "

Hence if a specific gravity is observed at any of these temperatures it must be × the corresponding weight ÷ 10,000 to reduce it to a comparison with water at 62°; the expansion of the body observed is another question altogether, and must be compensated also.

The weight of a cubic inch, or other linearly measured volume, of water is not yet very accurately known. The observations have been made by weighing closed hollow metal cases in and out of water (thus obtaining the weight of an equal volume of water), and then gauging the size of the case with exactitude. Cubes, cylinders, and spheres have been employed. The results are:[4]

		Cubic Inch at 62° F.	Cubic Foot at 62° F.	Cubic Decimetre at 4°C.
		Grains.	Ounces.	Grammes
1795	In France, by Lefevre-Gineau (legal French)	252.603	997.70	1000.000
1797 1821	In England, by Shuckburgh and Kater (legal British)	252.724	998.18	1000.480
1825	In Sweden, by Berzelius, Svanberg, and Akermann	252.678	998.00	1000.296
1830	In Austria, by Stampfer	252.515	997.35	999.653
1841	In Russia, by Kupffer	252.600	997.69	999.989

National Standards and Copies.—Having now noticed the principles and constants involved, we will consider the British and metric standards, the only ones now used in scientific work.

The imperial standard yard is a bronze bar 38 inches long, 1 inch square; the defining lines, 36 inches apart, are cut on gold studs, sunk in holes, so that their surface passes through the axis of the bar. Thus flexure does not tend to tip the engraved surfaces nearer or farther apart. This bar when in use rests on a lever frame, which supports it at 8 points, 4.78 inches apart, on rollers which divide the pressure exactly equally.[5] This standard is in actual use for all important comparisons at the Standards Office. Four copies, which are all equal to it, within ⅛° of temperature, are deposited in other places in case of injury or loss of the standard. The standard pound is a thick disk of platinum about 1⅛ inches across, and 1 inch high, with a shallow groove around it near the top. Four copies are deposited with the above copies of the yard. For public use there are a series of end-standards exposed on the outer wall of Greenwich observatory; and a length of 100 feet, and another of 66 feet (1 chain), marked on brass plates let into the granite step along the back of Trafalgar Square. As this is a practically invariable earth-fast standard, and most convenient for reference, it is important to know the minute errors of it, as determined by the Standards Department.[1] Starting from 0 the errors are in inches—

---

[1] Computed from Fizeau, *Ann. Bur. Long.*, 1878.

[2] Computed from Chisholm, *Weighing and Measuring*, 1877, p. 162; also see p. 158.

[3] Computed from *Report* of Standards Department, 1883.

[4] Computed from Chisholm, *op. cit.*, p. 112.

[5] See Chisholm, *op. cit.*, pp. 188, 189. For less refined purposes measuring bars should be supported on two points, 21 per cent. of the whole length from the ends. This equalizes the strains in the curves, and makes a minimum distortion.

at	0	10	20	30	40	50	60	70	80	90	100 ft.
error	0	—.007	-.019	-.022	-.015	-.008	-.007	+.011	+.021	+0.17	-.008 in.

The mean uncertainty in these values is .003, and the greatest uncertainty .01. The total length of the chain standard is — .019 inch from the truth. There is also a public balance provided at Greenwich observatory, which shows the accuracy of any pound weight placed upon it. For important scientific standards comparisons are made gratuitously, as a matter of courtesy, by the officials of the Standards Office, 7 Old Palace Yard, Westminster. The most delicate weighings are all performed in a vacuum case with glass sides, which is so constructed that the weights can be exchanged from one arm to the other without opening the case, so as to obtain double weighings.

The toleration of error in copies for scientific purposes, by the Standards Department, is .0005 inch on the yard or lesser lengths, about equal to 15 divisions of the micrometer; on the pound .0025 grain, about ½ a division of the official balances; on the ounce .001 grain; on the gallon 1 grain; and on the cubic foot 4 grains. The toleration for commercial copies is .005 on the yard, .001 on the foot and under, and .1 grain on weights of 1 ounce to 1 pound.[2] The Standards Commission of 1851 recommended a limit of 1 in 20,000.

For practical work of moderate accuracy the most convenient forms of measures are—for lengths under a foot, feather-edge metal scales divided to $\frac{1}{50}$ inch (finer divisions are only confusing, and $\frac{1}{1000}$ of an inch can be safely read by estimation); for lengths of 1 to 10 feet, metal tubes or deep bars bearing line-divisions, and with permanent feet attached at 21 per cent. from either end, so that the deformation by flexure is always the same; for long distances a steel tape with fine divisions scratched across it and numbered by etching. The most accurate way of using such a tape is not to prepare a flat bed for it, but to support it at points not more than 50 feet apart; then by observing the distances and levels of these points, and knowing the weight of the tape, the correction for the sloping distance between the points and the difference of the catenary length of the tape from the straight distance can be precisely calculated; the corrections for stretching of the tape (best done by a lever arm with fixed weight), and for temperature, are all that are needful besides.

The first French standard metre (of 1799) is a platinum bar end-standard of about 1 inch wide and ¼ inch thick; the new standard of the International Metric Commission is a line-standard of platino-iridium, 40 inches long and .8 inches square, grooved out on all four sides so that its section is between ✕ and H form; this provides the greatest rigidity, and also a surface in the axis of the bar to bear the lines of the standard. The new standard kilogramme, like the old one, is a cylinder of platinum of equal diameter and height. These new standards are preserved in the International Metric Bureau at Paris, to which seventeen nations contribute in support and direction, and in which the most refined methods of comparison are adopted. For lineal comparisons the alternate substitution of the measures on a sliding bed beneath fixed micrometer microscopes is provided as in the British office, and a bath for the heating of one measure in a liquid to ascertain its expansion. For weighing four balances are provided, each with mechanism for the transposition of the weights, and the lowering of the balance into play on its bearings, so that weighings can be performed at 13 feet distance from the balance, thus avoiding the disturbance caused by the warmth of the observer. The readings of the balance scale are made by a fixed telescope, the motion being observed by the reflection of a fixed scale from a mirror attached to the beam of the balance. In this bureau are also an equally fine hydrostatic balance for taking specific gravities by water weighing, a standard barometer, and an air thermometer, with all subsidiary apparatus. The special work of the bureau is the construction and comparison of metric standards for all the countries supporting it, and for scientific work of all kinds.

The legal theory of the British system of weights and measures is—(A) the standard yard, with all lineal measures and their squares and cubes based upon that; (B) the standard pound of 7000 grains, with all weights based upon that, with the troy pound of 5760 grains for trade purposes; (C) the standard gallon (and multiples and fractions of it), declared to contain 10 ℔ of water at 62° F., being in volume 277.274 cubic inches, which contain each 252.724 grains of water in a vacuum at 62°, or 252.458 grains of water weighed with brass weights in air of 62° with the barometer at 30 inches.

The legal theory of the metric system of weights and measures is—(A) the standard metre, with decimal fractions and multiples thereof; (B) the standard kilogramme, with decimal fractions and multiples thereof; (C) the litre (with decimal fractions and multiples), declared to be a cube of $\frac{1}{10}$ metre, and to contain a kilogramme of water at 4° C., in a vacuum. No standard litre exists, all liquid measures being legally fixed by weight. The metre was supposed, when established in 1799, to be a ten-millionth of the quadrant of the earth through Paris; it differs from this theoretical amount by about 1 in 4000.

The legal equivalents between the British and French systems are — metre = 39.37079 inches; kilogramme = 15432.34874 grains. By the more exact comparisons of Captain Clarke (1866) the metre (at 0° C., 32° F.) is equal to 39.37043196 inches of the yard at 62° F.; but Rogers in 1882 compared the metre as 39.37027. It must always be remembered that a French metre of perfect legal exactitude will, by expanding from 32° to 62° F., become equal to a greater number of inches when the two measures are placed together; thus a brass metre is equal to 39.382 inches when compared with British measures at the same temperature, and this is its true commercial equivalent. The kilogramme determination above is that of Professor Miller (1844), against the kilogramme des Archives, but in 1884 the international kilogramme yielded 15432.35639.

For further details, see H. W. Chisholm, *Weighing and Measuring* (Nature series), 1877, and *Reports* of the Warden of the Standards, subsequently of the Standards Department (all in British Museum Newspaper Room), for all practical details,—especially reports on metre (1868–1869), errors of grain weights (1872), principles of measuring (long paper of German Standards Commission, translated 1872), Trafalgar Square standards (1876), density of water (1883), toleration of error, British and international (1883), standard wire and plate gauges in inches (1883), besides numerous practical tables, mainly in the earlier numbers before the wardenship was merged in the Board of Trade.

II. HISTORICAL.

Though no line can be drawn between ancient and modern metrology, yet, owing to neglect, and partly to the scarcity of materials, there is a gap of more than a thousand years over which the connection of units[1] of measure is mostly guess-work. Hence, except in a few cases, we shall not here consider any units of the Middle Ages. A constant difficulty in studying works on metrology is the need of distinguishing the absolute facts of the case from the web of theory into which each writer has woven them,—often the names used, and sometimes the very existence of the units in question, being entirely an assumption of the writer. Therefore we shall here take the more pains to show what the actual authority is for each conclusion. Again, each writer has his own leaning: Böckh, to the study of water-volumes and weights, even deriving linear measures therefrom; Queipo, to the connection with Arabic and Spanish measures; Brandis, to the basis of Assyrian standards; Mommsen, to coin weights; and Bortolotti to Egyptian units; but Hultsch is more general, and appears to give a more equal representation of all sides than do other authors. In this article the tendency will be to trust far more to actual measures and weights than to the statements of ancient writers; and this position seems to be justified by the great increase in materials, and the more accurate means of study of late. The usual arrangement by countries has been mainly abandoned in favor of following out each unit as a whole, without recurring to it separately for every locality.

---

[1] *Report* of Warden of the Standards, 1875.

[2] *Report* of Warden, 1868, see also 1872.

The materials for study are of three kinds. (1) *Literary*, both in direct statements in works on measures (*e.g.*, Elias of Nisibis), medicine (Galen), and cosmetics (Cleopatra), in ready-reckoners (Didymus), clerk's (kátib's) guides, and like handbooks, and in indirect explanations of the equivalents of measures mentioned by authors (*e.g.*, Josephus). But all such sources are liable to the most confounding errors, and some passages relied on have in any case to submit to conjectural emendation. These authors are of great value for connecting the monumental information, but must yield more and more to the increasing evidence of actual weights and measures. Besides this, all their evidence is but approximate, often only stating quantities to a half or quarter of the amount, and seldom nearer than 5 or 10 per cent.; hence they are entirely worthless for all the closer questions of approximation or original identity of standards in different countries; and it is just in this line that the imagination of writers has led them into the greatest speculations, unchecked by accurate evidence of the original standards. (2) *Weights and measures actually remaining.* These are the prime sources, and, as they increase and are more fully studied, so the subject will be cleared and obtain a fixed basis. A difficulty has been in the paucity of examples, more due to the neglect of collectors than the rarity of specimens. The number of published weights did not exceed 600 of all standards a short time ago; but the collections in the last three years from Naucratis (28),[2] Defenneh (29), and Memphis (44) have supplied over six times this quantity, and of an earlier age than most other examples, while existing collections have been more thoroughly examined; hence there is need for a general revision of the whole subject. It is above all desirable to make allowances for the changes which weights have undergone; and, as this has only been done for the above Egyptian collections and that of the British Museum, conclusions as to the accurate values of different standards will here be drawn from these rather than Continental sources. (3) *Objects which have been made by measure or weight*, and from which the unit of construction can be deduced. Buildings will generally yield up their builder's foot or cubit when examined (*Inductive Metrology*, p. 9). Vases may also be found bearing such relations to one another as to show their unit of volume. And coins have long been recognized as one of the great sources of metrology,—valuable for their wide and detailed range of information, though most unsatisfactory on account of the constant temptation to diminish their weight, a weakness which seldom allows us to reckon them as of the full standard. Another defect in the evidence of coins is that, when one variety of the unit of weight was once fixed on for the coinage, there was (barring the depreciation) no departure from it, because of the need of a fixed value, and hence coins do not show the range and character of the real variations of units as do buildings, or vases, or the actual commercial weights.

PRINCIPLES OF STUDY.—(1) *Limits of Variation in Different Copies, Places, and Times.*—Unfortunately, so very little is known of the ages of weights and measures that this datum—most essential in considering their history—has been scarcely considered. In measure, Egyptians of Dynasty IV. at Gizeh on an average varied 1 in 350 between different buildings (27). Buildings at Persepolis, all of nearly the same age, vary in unit 1 in 450 (25). Including a greater range of time and place, the Roman foot in Italy varied during two or three centuries on an average $\frac{1}{400}$ from the mean. Covering a longer time, we find an average variation of $\frac{1}{200}$ in the Attic foot (25), $\frac{1}{150}$ in the English foot (25), $\frac{1}{170}$ in the English itinerary foot (25). So we may say that an average variation of $\frac{1}{400}$ by toleration, extending to double that by change of place and time, is usual in ancient measures. In weights of the same place and age there is a far wider range; at Defenneh (29), within a century probably, the average variation of different units is $\frac{1}{36}$, $\frac{1}{60}$, and $\frac{1}{67}$, the range being just the same as in all times and places taken together. Even in a set of weights all found together, the average variation is only reduced to $\frac{1}{60}$, in place of $\frac{1}{36}$ (29). Taking a wider range of place and time, the Roman libra has an average variation of $\frac{1}{50}$ in the examples of better period (43), and in those of Byzantine age $\frac{1}{35}$ (44). Altogether, we see that weights have descended from original varieties with so little intercomparison that no rectification of their values has been made, and hence there is as much variety in any one place and time as in all together. Average variation may be said to range from $\frac{1}{40}$ to $\frac{1}{70}$ in different units, doubtless greatly due to defective balances.

2. *Rate of Variation.*—Though large differences may exist, the rate of general variation is but slow,—excluding, of course, all monetary standards. In Egypt the cubit lengthened $\frac{1}{170}$ in some thousands of years (25,44). The Italian mile has lengthened $\frac{1}{100}$ since Roman times (2); the English mile lengthened about $\frac{1}{300}$ in four centuries (31). The English foot has not appreciably varied in several centuries (25). Of weights there are scarce any dated, excepting coins, which nearly all decrease; the Attic tetradrachm, however, increased $\frac{1}{50}$ in three centuries (28), owing probably to its being below the average trade weight to begin with. Roughly dividing the Roman weights, there appears a decrease of $\frac{1}{40}$ from imperial to Byzantine times (43).

3. *Tendency of Variation.*—This is, in the above cases of lengths, to an increase in course of time. The Roman foot is also probably $\frac{1}{300}$ larger than the earlier form of it, and the later form in Britain and Africa perhaps another $\frac{1}{300}$ larger (25). Probably measures tend to increase and weights to decrease in transmission from time to time or place to place; but far more data are needed to study this.

4. *Details of Variation.*—Having noticed variation in the gross, we must next observe its details. The only way of examining these is by drawing curves (28, 29), representing the frequency of occurrence of all the variations of a unit; for instance, in the Egyptian unit—the kat—counting in a large number how many occur between 140 and 141 grains, 141 and 142, and so on; such numbers represented by curves

---

[1] In the absence of the actual standards of ancient times the units of measure and of weight have to be inferred from the other remains; hence unit in this division is used for any more or less closely defined amount of length or weight in terms of which matter was measured.

[2] These figures refer to the list of publications at the end of the present section, p. 517.

show at once where any particular varieties of the unit lie (see *Naukratis*, i. p. 83). This method is only applicable where there is a large number of examples; but there is no other way of studying the details. The results from such a study—of the Egyptian kat, for example—show that there are several distinct families or types of a unit, which originated in early times, have been perpetuated by copying, and reappear alike in each locality (see *Tanis*, ii. pl. l.). Hence we see that if one unit is derived from another it may be possible, by the similarity or difference of the forms of the curves, to discern whether it was derived by general consent and recognition from a standard in the same condition of distribution as that in which we know it, or whether it was derived from it in earlier times before it became so varied, or by some one action forming it from an individual example of the other standard without any variation being transmitted. As our knowledge of the age and locality of weights increases these criteria in curves will prove of greater value; but even now no consideration of the connection of different units should be made without a graphic representation to compare their relative extent and nature of variation.

5. *Transfer of Units.*—The transfer of units from one people to another takes place almost always by trade. Hence the value of such evidence in pointing out the ancient course of trade, and commercial connections (17). The great spread of the Phœnician weight on the Mediterranean, of the Persian in Asia Minor, and of the Assyrian in Egypt are evident cases; and that the decimal weights of the laws of Manu (43) are decidedly not Assyrian or Persian, but on exactly the Phœnician standard, is a curious evidence of trade by water and not overland. If, as seems probable, units of length may be traced in prehistoric remains, they are of great value; at Stonehenge, for instance, the earlier parts are laid out by the Phœnician foot, and the later by the Pelasgo-Roman foot (26). The earlier foot is continually to be traced in other megalithic remains, whereas the later very seldom occurs (25). This bears strongly on the Phœnician origin of our prehistoric civilization. Again, the Belgic foot of the Tungri is the basis of the present English land measures, which we thus see are neither Roman nor British in origin, but Belgic. Generally a unit is transferred from a higher to a less civilized people; but the near resemblance of measures in different countries should always be corroborated by historical considerations of a probable connection by commerce or origin (Head, *Historia Numorum*, xxxvii). It should be borne in mind that in early times the larger values, such as minæ, would be transmitted by commerce, while after the introduction of coinage the lesser values of shekels and drachmæ would be the units; and this needs notice, because usually a borrowed unit was multiplied or divided according to the ideas of the borrowers, and strange modifications thus arose.

6. *Connections of Lengths, Volumes, and Weights.*—This is the most difficult branch of metrology, owing to the variety of connections which can be suggested, to the vague information we have, especially on volumes, and to the liability of writers to rationalize connections which were never intended. To illustrate how easy it is to go astray in this line, observe the continual reference in modern handbooks to the cubic foot as 1000 ounces of water; also the cubic inch is very nearly 250 grains, while the gallon has actually been fixed at 10 ℔ of water; the first two are certainly mere coincidences, as may very probably be the last also, and yet they offer quite as tempting a base for theorizing as any connections in ancient metrology. No such theories can be counted as more than coincidences which have been adopted, unless we find a very exact connection, or some positive statement of origination. The idea of connecting volume and weight has received an immense impetus through the metric system, but it is not very prominent in ancient times. The Egyptians report the weight of a measure of various articles, amongst others water (6), but lay no special stress on it; and the fact that there is no measure of water equal to a direct decimal multiple of the weight-unit, except very high in the scale does not seem as if the volume was directly based upon weight. Again, there are many theories of the equivalence of different cubic cubits of water with various multiples of talents (2, 3, 18, 24, 33); but connection by lesser units would be far more probable, as the primary use of weights is not to weigh large cubical vessels of liquid, but rather small portions of precious metals. The Roman amphora being equal to the cubic foot, and containing 80 libræ of water is one of the strongest cases of such relations, being often mentioned by ancient writers. Yet it appears to be only an approximate relation and therefore probably acccidental, as the volume by the examples is too large to agree to the cube of the length or to the weight, differing $\frac{1}{20}$, or sometimes even $\frac{1}{12}$. All that can be said therefore to the many theories connecting weight and measure is that they are possible, but our knowledge at present does not admit of proving or disproving their exactitude. Certainly vastly more evidence is needed before we would, with Böckh (2), derive fundamental measures through the intermediary of the cube roots of volumes. Soutzo wisely remarks on the intrinsic improbability of refined relations of this kind (*Étalons Ponderaux Primitifs*, note, p. 4).

Another idea which has haunted the older metrologists, but is still less likely, is the connection of various measures with degrees on the earth's surface. The lameness of the Greeks in angular measurement would alone show that they could not derive itinerary measures from long and accurately determined distances on the earth.

7. *Connections with Coinage.*—From the 7th century B.C. onward the relations of units of weight have been complicated by the need of the interrelations of gold, silver, and copper coinage; and various standards have been derived theoretically from others through the weight of one metal equal in value to a unit of another. That this mode of originating standards was greatly promoted, if not started, by the use of coinage we may see by the rarity of the Persian silver weight (derived from the Assyrian standard), soon after the introduction of coinage, as shown in the weights of Defenneh (29). The relative value of gold and silver (17, 21) in Asia is agreed generally to have been 13⅓ to 1 in the early ages of coinage; at Athens in 434 B.C. it was 14 : 1; in Macedon, 350 B.C., 12½ : 1; in Sicily, 400 B.C., 15 : 1, and 300 B.C., 12 : 1; in Italy, in 1st century, it was 12 : 1, in the later empire 13.9 : 1, under Justinian 14.4 : 1, and in modern times 15.5 : 1, but at present 23 : 1,—the fluctuations depending mainly on the opening of large mines. Silver stood to copper in Egypt as 80 : 1 (Brugsch), or 120 : 1 (Revillout); in early Italy and Sicily as 250 : 1 (Mommsen), or 120 : 1 (Soutzo), under the empire 120 : 1, under Justinian 100 : 1; at present it is 150 : 1. The distinction of the use of standards for trade in general, or for silver or gold in particular, should be noted. The early observance of the relative values may be inferred from Num. vii. 13, 14, where silver offerings are 13 and 7 times the weight of the gold, or of equal value and one-half value.

8. *Legal Regulation of Measures.*—Most states have preserved official standards, usually in temples under priestly custody. The Hebrew "shekel of the sanctuary" is familiar; the standard volume of the apet was secured in the dromus of Anubis at Memphis (35); in Athens, besides the standard weight, twelve copies for public comparison were kept in the city; also standard volume measures in several places (2); at Pompeii the block with standard volumes cut in it was found in the portico of the forum (33); other such standards are known in Greek cities (Gythium,

Panidum, and Trajanopolis) (11, 33); at Rome the standards were kept in the Capitol, and weights also in the temple of Hercules (2); the standard cubit of the Nilometer was before Constantine in the Serapæum, but was removed by him to the church (2). In England the Saxon standards were kept at Winchester before 950 A.D., and copies were legally compared and stamped; the Normans removed them to Westminster to the custody of the king's chamberlains at the exchequer; and they were preserved in the crypt of Edward the Confessor, while remaining royal property (9). The oldest English standards remaining are those of Henry VII. Many weights have been found in the temenos of Demeter at Cnidus, the temple of Artemis at Ephesus, and in a temple of Aphrodite at Byblus (44); and the making or sale of weights may have been a business of the custodians of the temple standards.

9. *Names of Units.*—It is needful to observe that most names of measures are generic and not specific, and cover a great variety of units. Thus foot, digit, palm, cubit, stadium, mile, talent, mina, stater, drachm, obol, pound, ounce, grain, metretes, medimnus, modius, hin, and many others mean nothing exact unless qualified by the name of their country or city. Also, it should be noted that some ethnic qualifications have been applied to different systems, and such names as Babylonian and Euboic are ambiguous; the normal value of a standard will therefore be used here rather than its name, in order to avoid confusion, unless specific names exist, such as *kat* and *uten*.

All quantities stated in this article without distinguishing names are in British units of inch, cubic inch, or grain.

STANDARDS OF LENGTH.—Most ancient measures have been derived from one of two great systems, that of the cubit of 20.63 inches, or the digit of .729 inch; and both these systems are found in the earliest remains.

20.63 ins. First known in Dynasty IV. in Egypt, most accurately 20.620 in the Great Pyramid, varying 20.51 to 20.71 in Dyn. IV. to VI. (27). Divided decimally in 100ths; but usually marked in Egypt into 7 palms or 28 digits, approximately; a mere juxtaposition (for convenience) of two incommensurate systems (25, 27). The average of several cubit rods remaining is 20.65, age in general about 1000 B.C. (33). At Philæ, etc., in Roman times 20.76 on the Nilometers (44). This unit is also recorded by cubit lengths scratched on a tomb at Beni Hasan (44), and by dimensions of the tomb of Ramessu IV. and of Edfu temple (5) in papyri. From this cubit, *mahi*, was formed the *xylon* of 3 cubits, the usual length of a walking-staff; fathom, *nent*, of 4 cubits, and the *khet* of 40 cubits (18); also the *schœnus* of 12,000 cubits, actually found marked on the Memphis-Faium road (44).

Babylonia had this unit nearly as early as Egypt. The divided plotting scales lying on the drawing boards of the statues of Gudea (*Nature*, xxviii. 341) are of ½ 20.89, or a span of 10.44, which is divided in 16 digits of .653, a fraction of the cubit also found in Egypt. Buildings in Assyria and Babylonia show 20.5 to 20.6. The Babylonian system was sexagesimal, thus (18) —

uban,	5=qat,	6=ammat,	6=qanu,	60=sos,	30=parasang	2=kaspu
.69 inch	3.44	20.6	124	7430	223,000	446,000

Asia Minor had this unit in early times,—in the temples of Ephesus 20.55, Samos 20.62; Hultsch also claims Priene 20.90, and the stadia of Aphrodisias 20.67, and Laodicea 20.94. Ten buildings in all give 20.63 mean (18, 25); but in Armenia it rose to 20.76 in late Roman times, like the late rise in Egypt (25). It was specially divided into ⅙th, the foot of ⅗ths being as important as the cubit.

12.45 ins. ⅗ of 20.75. This was especially the Greek derivative of the 20.63 cubit. It originated in Babylonia as the foot of that system (24), in accordance with the sexary system applied to the early decimal division of the cubit. In Greece it is the most usual unit, occurring in the Propylæa at Athens 12.44, temple at Ægina 12.40, Miletus 12.51, the Olympic course 12.62, etc. (18); thirteen buildings giving an average of 12.45, mean variation .06 (25), = ⅗ of 20.75, m. var. .10. The digit = ¼ palæste, = ¼ foot of 12.4; then the system is

$$\text{foot,}\left\{\begin{array}{l}1\tfrac{1}{2}=\text{cubit},\quad 4=\text{orguia}\ldots\ldots\ldots\ldots\ldots\ldots\ 100= \\ 10\ldots\ldots\ldots\ldots\ldots\ldots=\text{acæna},\ 10=\text{plethron},\quad 6=\end{array}\right\}\text{stadion.}$$

12.4 inch 18.7 74.7 124.5 1245 7470

In Etruria it probably appears in tombs as 12.45 (25); perhaps in Roman Britain; and in mediæval England as 12.47 (25).

13.8 ins. ⅔ of 20.7. This foot is scarcely known monumentally. On three Egyptian cubits there is a prominent mark at the 19th digit or 14 inches, which shows the existence of such a measure (33). It became prominent when adopted by Philetærus about 280 B.C. as the standard of Pergamum (42), and probably it had been shortly before adopted by the Ptolemies for Egypt. From that time it is one of the principal units in the literature (Didymus, etc.), and is said to occur in the temple of Augustus at Pergamum as 13.8 (18). Fixed by the Romans at 16 digits (13⅓ = Roman foot), or its cubit at 1⅘ Roman feet, it was legally = 13.94 at 123 B.C. (42); and 7½ Philetærean stadia were = Roman mile (18). The multiples of the 20.63 cubit are in late times generally reckoned in these feet of ⅔ cubit. The name "Babylonian foot" used by Böckh (2) is only a theory of his, from which to derive volumes and weights; and no evidence for this name, or connection with Babylon, is to be found. Much has been written (2, 3, 33) on supposed cubits of about 17-18 inches derived from 20.63,—mainly, in endeavoring to get a basis for the Greek and Roman feet, but these are really connected with the digit system; and the monumental or literary evidence for such a division of 20.63 will not bear examination. There

17.30 ⅚ of 20.76. is, however, fair evidence for units of 17.30 and 1.730 or 1/12 of 20.76 in Persian buildings (25); and the same is found in Asia Minor as 17.25 or ⅚ of 20.70. On the Egyptian cubits a small cubit is marked as about 17 inches, which may well be this unit, as ⅚ of 20.6 is 17.2; and, as these marks are placed *before* the 23d digit or 17.0, they cannot refer to 6 palms, or 17.7, which is the 24th digit, though they are usually attributed to that (33).

We now turn to the second great family based on the digit. This has been so usually confounded with the 20.63 family, owing to the juxtaposition of 28 digits with that cubit in Egypt, that it should be observed how the difficulty of their incommensurability has been felt. For instance, Lepsius (3) supposed two primitive cubits of 13.2 and 20.63, to account for 28 digits being only 20.4 when free from the cubit of 20.63,—the first 24 digits being in some cases made shorter on the cubits to agree with the true digit standard, while the remaining 4 are lengthened to fill up to 20.6. In

.727 ins. the Dynasties IV. and V. in Egypt the digit is found in tomb sculptures as .727 (27); while from a dozen examples in the later remains we find the mean .728 (25). A length of 10 digits is marked on all the inscribed Egyptian cubits as the "lesser span" (33). In Assyria the same digit appears as .730, particularly at Nimrud (25); and in Persia buildings show the 10-digit length of 7.34 (25). In Syria it was about .728, but variable; in eastern Asia Minor more like the Persian, being .732 (25). In these cases the digit itself, or decimal multiples, seem to have been used.

18.23 25×.729. The pre-Greek examples of this cubit in Egypt, mentioned by Böckh (2), give 18.23 as a mean, which is 25 digits of .729, and has no relation to the 20.63 cubit. This cubit, or one nearly equal, was used in Judæa in the times of the kings, as the Siloam inscription names a distance of 1758 feet as roundly 1200 cubits, showing a cubit of about 17.6 inches. This is also evidently the Olympic cubit; and, in pursuance of the decimal multiple of the digit found in Egypt and Persia, the cubit of 25 digits was ¼ of the orguia of 100 digits, the series being

$$\text{old digit,}\left\{\begin{array}{l}25=\text{cubit},\qquad 4= \\ \quad 100\ldots\ldots\ldots\ldots\ldots= \end{array}\right\}\text{orguia},\quad 10=\text{amma},\quad 10=\text{stadion.}$$

.729 inch 18.2 72.9 729 7296

Then, taking ⅔ of the cubit, or ⅙ of the orguia, as a foot, the Greeks arrived at their foot of 12.14; this, though very well known in literature, is but rarely found, and then generally in the form of the cubit, in monumental measures. The Parthenon step, celebrated as 100 feet wide, and apparently 225 feet long, gives by Stuart 12.137, by Penrose 12.165, by Paccard 12.148, differences due to scale and not to slips in measuring. Probably 12.16 is the nearest value. There are but few buildings wrought on this foot in Asia Minor, Greece, or Roman remains. The Greek system, however, adopted this foot as a basis for decimal multiplication, forming

foot,	10=acæna,	10=plethron,
12.16 inches	121.6	1216

which stand as ⅙th of the other decimal series based on the digit. This is the agrarian system, in contrast to the orguia system, which was the itinerary series (33).

Then a further modification took place, to avoid the inconvenience of dividing the foot in 16⅔ digits, and a new digit was formed—longer than any value of the old digit—of $\frac{1}{16}$ of the foot, or .760, so that the series ran

digit,	10 = lichas			
	96	= orguia,	10 = amma,	10 = stadion.
.76 inch	7.6	72.9	729	7296

This formation of the Greek system (25) is only an inference from the facts yet known, for we have not sufficient information to prove it, though it seems much the simplest and most likely history.

11.62 16 × .726.

Seeing the good reasons for this digit having been exported to the west from Egypt—from the presence of the 18.23 cubit in Egypt, and from the .729 digit being the decimal base of the Greek long measures—it is not surprising to find it in use in Italy as a digit, and multiplied by 16 as a foot. The more so, as the half of this foot, or 8 digits, is marked off as a measure on the Egyptian cubit rods (33). Though Queipo has opposed this connection (not noticing the Greek link of the digit), he agrees that it is supported by the Egyptian square measure of the plethron, being equal to the Roman actus (33). The foot of 11.6 appears probably first in the prehistoric and early Greek remains, and is certainly found in Etrurian tomb dimensions as 11.59 (25). Dörpfeld considers this as the Attic foot, and states the foot of the Greek metrological relief at Oxford as 11.65 (or 11.61, Hultsch). Hence we see that it probably passed from the East through Greece to Etruria, and thence became the standard foot of Rome; there, though divided by the Italian duodecimal system into 12 unciæ, it always maintained its original 16 digits, which are found marked on some of the foot-measures. The well-known ratio of 25 : 24 between the 12.16 foot and this we see to have arisen through one being ⅙ of 100 and the other 16 digits,—16⅔ : 16 being as 25 : 24, the legal ratio. The mean of a dozen foot-measures (1) gives 11.616 ± .008, and of long lengths and buildings 11.607 ± .01. In Britain and Africa, however, the Romans used a rather longer form (25) of about 11.68, or a digit of .730. Their series of measures was

digitus,	4 = palmus,	4 = pes,	5 = passus,	125 = stadium,
.726 inch	2.90	11.62	58.1	7262

8 = milliare;
58,100

also

uncia .968 = $\frac{1}{12}$ pes, palmipes 14.52 = 5 palmi, cubitus 17.43 = 6 palmi.

Either from its Pelasgic or Etrurian use or from Romans, this foot appears to have come into prehistoric remains, as the circle of Stonehenge (26) is 100 feet of 11.68 across, and the same is found in one or two other cases. 11.60 also appears as the foot of some mediæval English buildings (25).

We now pass to units between which we cannot state any connection.

25.1.—The earliest sign of this cubit is in a chamber at Abydos (44) about 1400 B.C.; there, below the sculptures, the plain wall is marked out by red designing lines in spaces of 25.13 ± .03 inches, which have no relation to the size of the chamber or to the sculpture. They must therefore have been marked by a workman using a cubit of 25.13. Apart from mediæval and other very uncertain data, such as the Sabbath day's journey being 2000 middling paces for 2000 cubits, it appears that Josephus, using the Greek or Roman cubit, gives half as many more to each dimension of the temple than does the Talmud; this shows the cubit used in the Talmud for temple measures to be certainly not under 25 inches. Evidence of the early period is given, moreover, by the statement in 1 Kings (vii. 26) that the brazen sea held 2000 baths; the bath being about 2300 cubic inches, this would show a cubit of 25 inches. The corrupt text in Chronicles of 3000 baths would need a still longer cubit; and if a lesser cubit of 21.6 or 18 inches be taken, the result for the size of the bath would be impossibly small. For other Jewish cubits see 18.2 and 21.6. Oppert (24) concludes from inscriptions that there was in Assyria a royal cubit of $\frac{7}{6}$ the U cubit, or 25.20; and four monuments show (25) a cubit averaging 25.28. For Persia Queipo (33) relies on, and develops, an Arab statement that the Arab *hashama* cubit was the royal Persian, thus fixing it at about 25 inches; and the Persian guerze at present is 25, the royal guerze being 1½ times this, or 37½ inches. As a unit of 1.013, decimally multiplied, is most commonly to be deduced from the ancient Persian buildings, we may take 25.34 as the nearest approach to the ancient Persian unit.

21.6.—The circuit of the city wall of Khorsabad (24) is minutely stated on a tablet as 24,740 feet (U), and from the actual size the U is therefore 10.806 inches. Hence the recorded series of measures on the Senkereh tablet are valued (Oppert) as—

susi,	20 = (palm),	3 = U,	6 = qanu,	2 = sa,	5 = (n),	12 = us,
	60	= U,	60		= (n).	
.18 inch	3.6	10.80	64.8	129.6	648	7,776

30 = kasbu.
223,280

Other units are the suklum or ½U = 5.4, and cubit of $2\dot{U}$ = 21.6, which are not named in this tablet. In Persia (24) the series on the same base was—

vitasti,	2 = arasni,	360 = asparasa,	30 = parathañha,	2 = gāv;
10.7 inches	21.4	7704	231,120	462,240

probably

yava,	6 = angusta,	10 = vitasti;	and gama = $\frac{3}{5}$ arasni;
.18 inch	1.07	10.7	12.8 = 21.4

also bāzu = 2 arasni.
42.8 21.4

The values here given are from some Persian buildings (25), which indicate 21.4, or slightly less; Oppert's value, on less certain data, is 21.52. The Egyptian cubits have an arm at 15 digits or about 10.9 marked on them, which seems like this same unit (33).

This cubit was also much used by the Jews (33), and is so often referred to that it has eclipsed the 25.1 cubit in most writers. The Gemara names 3 Jewish cubits (2) of 5, 6, and 7 palms; and, as Oppert (24) shows that 25.2 was reckoned 7 palms, 21.6 being 6 palms, we may reasonably apply this scale to the Gemara list, and read it as 18, 21.6, and 25.2 inches. There is also a great amount of mediæval and other data showing this cubit of 21.6 to have been familiar to the Jews after their captivity; but there is no evidence for its earlier date, as there is for the 25-inch cubit (from the brazen sea) and for the 18-inch cubit from the Siloam inscription.

From Assyria also it passed into Asia Minor, being found on the city standard of Ushak in Phrygia (33), engraved as 21.8, divided into the Assyrian foot of 10.8, and half and quarter, 5.4 and 2.7. Apparently the same unit is found (18) at Heraclea in Lucania, 21.86; and, as the general foot of the South Italians, or Oscan foot (18), best defined by the 100 feet square being $\frac{3}{10}$ of the jugerum, and therefore = 10.80 or half of 21.60. A cubit of 21.5 seems certainly to be indicated in prehistoric remains in Britain, and also in early Christian buildings in Ireland (25).

22.2.—Another unit not far different, but yet distinct, is found apparently in Punic remains at Carthage (25), about 11.16 (22.32), and probably also in Sardinia as 11.07 (22.14), where it would naturally be of Punic origin. In the Hauran 22.16 is shown by a basalt door (British Museum), and perhaps elsewhere in Syria (25). It is of some value to trace this measure, since it is indicated by some prehistoric English remains as 22.4.

20.0.—This unit may be that of the pre-Semitic Mesopotamians, as it is found at the early temple of Mukayyir (Ur); and, with a few other cases (25), it averages 19.97. It is described by Oppert (24), from literary sources, as the great U of 222 susi or 39.96, double of 19.98; from which was formed a reed of 4 great U or 159.8. The same measure decimally divided is also indicated by buildings in Asia Minor and Syria (25).

19.2.—In Persia some buildings at Persepolis and other places (25) are constructed on a foot of 9.6, or cubit of 19.2; while the modern Persian arish is 38.27 or 2×19.13. The same is found very clearly in Asia Minor (25), averaging 19.3; and it is known in literature as the Pythic foot (18, 33) of 9.75, or ½ of 19.5, if Censorinus is rightly understood. It may be shown by a mark (33) on the 26th digit of Sharpe's Egyptian cubit = 19.2 inches.

13.3.—This measure does not seem to belong to very early times, and it may probably have originated in Asia Minor. It is found there as 13.35 in buildings. Hultsch gives it rather less, at 13.1 as the "small Asiatic foot." Thence it passed to Greece, where it is found (25) as 13.36. In Romano-African remains it is often found, rather higher, or 13.45 average (25). It lasted in Asia apparently till the building of the palace at Mashita (620 A.D.), where it is 13.22, according to the rough measures we have (25). And it may well be the origin of the dirá' Stambuli of 26.6, twice 13.3. Found in Asia Minor and northern Greece, it does not appear unreasonable to connect it, as Hultsch does, with the Belgic foot of the Tungri, which was legalized (or perhaps introduced) by Drusus when governor, as ⅛ longer than the Roman foot, or 13.07; this statement was evidently an approximation by an increase of 2 digits, so that the small difference from 13.3 is not worth notice. Further the pertica was 12 feet of 18 digits, *i.e.*, Drusian feet.

Turning now to England, we find (25) the commonest building foot up to the 15th century averaged 13.22. Here we see the Belgic foot passed over to England, and we can fill the gap to a considerable extent from the itinerary measures. It has been shown (31) that the old English mile, at least as far back as the 13th century, was of 10 and not 8 furlongs. It was therefore equal to 79,200 inches, and divided decimally into 10 furlongs, 100 chains, or 1000 fathoms. For the existence of this fathom (half the Belgic pertica) we have the proof of its half, or yard, needing to be suppressed by statute (9) in 1439, as "the yard and full hand," or about 40 inches,—evidently the yard of the most usual old English foot of 13.22, which would be 39.66. We can restore then the old English system of long measure from the buildings, the statute-prohibition, the surviving chain and furlong, and the old English mile shown by maps and itineraries, thus:—

foot,	3 = yard,	2 = fathom,	10 = chain,	10 = furlong,	10 = mile.
13.22	39.66	79.32	793	7932	79,320

Such a regular and extensive system could not have been put into use throughout the whole country suddenly in 1250, especially as it must have had to resist the legal foot now in use, which was enforced (9) as early as 950. We cannot suppose that such a system would be invented and become general in face of the laws enforcing the 12-inch foot. Therefore it must be dated some time before the 10th century, and this brings it as near as we can now hope to the Belgic foot, which lasted certainly to the 3d or 4th century, and is exactly in the line of migration of the Belgic tribes into Britain. It is remarkable how near this early decimal system of Germany and Britain is the double of the modern metric system. Had it not been unhappily driven out by the 12-inch foot, and repressed by statutes both against its yard and mile, we should need but a small change to place our measures in accord with the metre.

The Gallic leuga, or league, is a different unit, being 1.59 British miles by the very concordant itinerary of the Bordeaux pilgrim. This appears to be the great Celtic measure, as opposed to the old English, or Germanic mile. In the northwest of England and in Wales this mile lasted as 1.56 British miles till 1500; and the perch of those parts was correspondingly longer till this century (31). The "old London mile" was 5000 feet, and probably this was the mile which was modified to 5280 feet, or 8 furlongs and so became the British statute mile.

STANDARDS OF AREA.—We cannot here describe these in detail. Usually they were formed in each country on the squares of the long measures. The Greek system was—

foot,	36 = hexapodes	100 = ...acæna,	25 = aroura,	4 = plethron.
1.027 sq. ft.	36.96	102.68	2567	10,268

The Roman system was—

pes,	100 = decempeda,	36 = clima,	4 = actus,	2 = jugerum,
.94 sq. ft.	94	3384	13,536	27,072

jugerum,	2 = heredium,	100 = centuria,	4 = saltus.
.6205 acre	1.241	124.1	496.4

STANDARDS OF VOLUME.—There is great uncertainty as to the exact values of all ancient standards of volume,—the only precise data being those resulting from the theories of volumes derived from the cubes of feet and cubits. Such theories, as we have noticed, are extremely likely to be only approximations in ancient times, even if recognized then; and our data are quite inadequate for clearing the subject. If certain equivalences between volumes in different countries are stated here, it must be plainly understood that they are only known to be approximate results, and not to give a certain basis for any theories of derivation. All the actual monumental data that we have are alluded to here, with their amounts. The impossibility of safe correlation of units necessitates a division by countries.

Egypt.—The hon was the usual small standard; by 8 vases which have contents stated in hons (8, 12, 20, 22, 33, 40) the mean is 29.2 cubic inches ± .6; by 9 unmarked pottery measures (30) 29.1 ± .16, and divided by 20; by 18 vases, supposed multiples of hon (1), 32.1 ± .2. These last are probably only rough, and we may take 29.2 cubic inches ± .5. This was reckoned (6) to hold 5 utens of water (uten ∴ 1470 grains), which agrees well to the weight; but this was probably an approximation, and not derivative, as there is (14) a weight called shet of 4.70 or 4.95 uten, and this was perhaps the actual weight of a hon. The variations of hon and uten, however, cover one another completely. From ratios stated before Greek times (35) the series of multiples was

ro,	8 = hon,	4 = honnu,	10 = apet or besha	4 = tama	......10 = (Theban),	10 = sa.
3.65 cub. in.	29.2	116.8	1168	4672	11,680	116,800

(Theban) is the "great Theban measure."

In Ptolemaic times the artaba (2336.), modified from the Persian, was general in Egypt, a working equivalent to the Attic metretes,—value 2 apet or $\frac{1}{2}$ tama; medimnus = tama or 2 artabas, and fractions down to $\frac{1}{400}$ artaba (35). In Roman times the artaba remained (Didymus), but $\frac{1}{3}$ was the usual unit (name unknown), and this was divided down to $\frac{1}{24}$ or $\frac{1}{144}$ artaba (35),—thus producing, by $\frac{1}{72}$ artaba a working equivalent to the xestes and sextarius (35). Also a new Roman artaba (Didymus) of 1540, was brought in. Beside the equivalence of the hon to 5 utens weight of water, the mathematical papyrus (35) gives 5 besha = $\frac{2}{3}$ cubic cubit (Revillout's interpretation of this as 1 cubit^3 is impossible geometrically, see *Rev. Eg.*, 1881, for data); this is very concordant, but it is very unlikely for 3 to be introduced in an Egyptian derivation, and probably therefore only a working equivalent. The other ratio of Revillout and Hultsch, 320 hons = cubit^3 is certainly approximate.

Syria, Palestine, and Babylonia.—Here there are no monumental data known; and the literary information does not distinguish the closely connected, perhaps identical, units of these lands. Moreover, none of the writers are before the Roman period, and many relied on are mediæval rabbis. A large number of their statements are rough (2, 18, 33), being based on the working equivalence of the bath or epha with the Attic metretes, from which are sometimes drawn fractional statements which seem more accurate than they are. This, however, shows the bath to be about 2500 cubic inches. There are two better data (2) of Epiphanius and Theodoret,—Attic medimnus = $1\frac{1}{2}$ baths, and saton ($\frac{1}{3}$ bath) = $1\frac{2}{3}$ modii; these give about 2240 and 2260 cubic inches. The best datum is in Josephus (*Ant.*, iii. 15, 3), where 10 baths = 41 Attic or 31 Sicilian medimni, for which it is agreed we must read modii (33); hence the bath = 2300 cubic inches. Thus these three different reckonings agree closely, but all equally depend on the Greek and Roman standards, which are not well fixed. The Sicilian modius here is $\frac{10}{31}$, or slightly under $\frac{1}{3}$, of the bath, and so probably a Punic variant of the $\frac{1}{3}$ bath or saton of Phœnicia. One close datum, if trustworthy, would be log of water = Assyrian mina ∴ bath about 2200 cubic inches. The rabbinical statement of cubic cubit of 21.5 holding 320 logs puts the bath at about 2250 cubic inches; their log-measure, holding six hen's eggs, shows it to be over rather than under this amount; but their reckoning of bath = $\frac{1}{8}$ cubit cubed is but approximate; by 21.5 it is 1240, by 25.1 it is 1990 cubic inches. The earliest Hebrew system was—

(log.	4 = kab).........	3 = hin, 6	'issarón......... 10	= bath, or epha,	10 = homer—wet. or kor—dry.
32 cub. in.	128	230	283	2300	23,000

'Issarón ("tenth-deal") is also called gomer.. The log and kab are not found till the later writings; but the ratio of hin to 'issarón is practically fixed in early times by the proportions in Num. xv. 4–9. Epiphanius stating great hin = 18 xestes, and holy hin = 9, must refer to Syrian xestes, equal to 24 and 12 Roman; this makes holy hin as above, and great hin a double hin, *i.e.*, seah or saton. His other statements of saton = 56 or 50 sextaria remain unexplained, unless this be an error for bath = 56 or 50 Syr. sext. and ∴ = 2290 or 2560 cubic inches. The wholesale theory of Revillout (35) that all Hebrew and Syrian measures were doubled by the Ptolemaic revision, while retaining the same names, rests entirely on the resemblance of the names apet and epha, and of log to the Coptic and late measure lok. But there are other reasons against accepting this, besides the improbability of such a change.

The Phœnician and old Carthaginian system was (18)—

log,	4 = kab,	6 = saton,	30 = corus,
31 cub. in.	123	740	22,200

valuing them by 31 Sicilian = 41 Attic modii (Josephus, above).

The old Syrian system was (18)—

cotyle,	2 = Syr. xestes,	18 = sabitha or saton,	$1\frac{1}{2}$ = collathon,	2 = bath-artaba;
21 cub. in.	41	740	1110	2220

also

Syr. xestes,	45 = maris,	2 = metretes or artaba.
41	1850	3700

The later or Seleucidan system was (18)—

cotyle,	2 = Syr. xestes,	90 = Syr. metretes,
22	44	4000

the Syrian being $1\frac{1}{3}$ Roman sextarii.

The Babylonian system was very similar (18)—

($\frac{1}{4}$),	4 = capitha,	15 = maris	18 ....epha,	10 = homer,	6 = achane.
33 cub. in.	132	1980	2380	23,800	142,800

The approximate value from capitha = 2 Attic chœnices (Xenophon) warrants us in taking the achane as fixed in the following system, which places it closely in accord with the preceding.

In Persia Hultsch states—

capetis	...............48 = artaba, 40	maris.................. 72	= achane,
74.4 cub. in.	1983	3570	142,800

the absolute values being fixed by artaba = 51 Attic chœnices (Herod., i. 192). The maris of the Pontic system is $\frac{1}{2}$ of the above, and the Macedonian and Naxian maris $\frac{1}{10}$ of the Pontic (18). By the theory of maris $\frac{1}{8}$ of 20.6^3 it is 1755.; by maris = Assyrian talent, 1850, in place of 1850 or 1980 stated above; hence the more likely theory of weight, rather than cubit, connection is nearer to the facts.

Æginetan System.—This is so called from according with the Æginetan weight. The absolute data are all dependent on the Attic and Roman systems, as there are no monumental data. The series of names is the same as in the Attic system (18). The values are $1\frac{1}{2}$ × the Attic (Athenæus, Theophrastus, etc.) (2, 18), or more closely 11 to 12 times $\frac{1}{8}$ of Attic. Hence, the Attic cotyle being 17.5 cubic inches, the Æginetan is about 25.7. The Bœotian system (18) included the achane; if this = Persian, then cotyle = 24.7. Or, separately through the Roman system, the mnasis of Cyprus (18) = 170 sextarii; then the cotyle = 24.8. By the theory of the metretes being $1\frac{1}{2}$ talents Æginetan, the cotyle would be 23.3 to 24.7 cubic inches by the actual weights, which have tended to decrease. Probably then 25.0 is the best approximation. By the theory (18) of 2 metretes = cube of the 18.67 cubit from the 12.45 foot, the cotyle would be about 25.4, within .4; but then such a cubit is unknown among measures, and not likely to be formed, as 12.4 is $\frac{3}{5}$ of 20.6. The Æginetan system then was—

$$\begin{matrix} \text{cotyle,} & 4 = \text{chœnix,} & \left\{\begin{matrix} 3 = \text{chous} \ldots\ldots\ldots\ldots\ldots\ldots & & 16 \\ 8 = \ldots\ldots \text{hecteus,} & 4 = \text{metretes,} & 1\frac{1}{3} \end{matrix}\right\} \\ \text{25 cub. in.} & 100 & 300 \quad 800 \qquad 3200 \\ & & = \text{medimnus.} \\ & & 4800 \end{matrix}$$

This was the system of Sparta, of Bœotia (where the aporryma = 4 chœnices, the cophinus = 6 chœnices, and saites or saton or hecteus = 2 aporrymæ, while 30 medimni = achane, evidently Asiatic connections throughout), and of Cyprus (where 2 choes = Cyprian medimnus of which 5 = medimnus of Salamis, of which 2 = mnasis) (18).

Attic or Usual Greek System.—The absolute value of this system is far from certain. The best data are three stone slabs, each with several standard volumes cut in them (11, 18), and two named vases. The value of the cotyle from the Naxian slab is 15.4 (best, others 14.6–19.6); from a vase about 16.6; from the Panidum slab 17.1 (var. 16.2–18.2); from a Capuan vase 17.8; from the Ganus slab 17.8 (var. 17. 18.). From these we may take 17.5 as a fair approximation. It is supposed that the Panathenaic vases were intended as metretes; this would show a cotyle of 14.4–17.1. The theories of connection give for the value of the cotyle metretes = Æginetan talent, ∴ 15.4–16.6; metretes $\frac{4}{5}$ of 12.16 cubed, ∴ 16.6; metretes = $\frac{27}{25}$ of 12.16 cubed, ∴ 16.8; medimnus = 2 Attic talents hecteus = 20 minæ, chœnix = $2\frac{1}{2}$ minæ, ∴ 16.75; metretes = 3 cubic spithami ($\frac{1}{2}$ cubit = 9.12), ∴ 17.5; 6 metretes = 2 feet of 12.45 cubed, ∴ 17.8 cubic inches for cotyle. But probably as good theories could be found for any other amount; and certainly the facts should not be set aside, as almost every author has done, in favor of some one of half a dozen theories. The system of multiples was for liquids—

cyathus,	$1\frac{1}{2}$ = oxybaphon,	4 = cotyle,	12 = chous,
2.9 cub. in.	4.4	17.5	210

12 = metretes,
2520

with the tetarton (8.8), 2 = cotyle, 2 = xestes (35.), introduced from the Roman system. For dry measure—

cyathus,	6 = cotyle,	4 = chœnix,	8 = hecteus,
2.9 cub. in.	17.5	70	560

6 = medimnus,
3360

with the xestes, and amphoreus (1680) = $\frac{1}{2}$ medimnus, from the Roman system. The various late provincial systems of division are beyond our present scope (18).

System of Gythium.—A system differing widely both in units and names from the preceding is found on the standard slab of Gythium in the southern Peloponnesus (*Rev. Arch.*, 1872). Writers have unified it with the Attic, but it is decidedly larger in its unit, giving 19.4 (var. 19.1–19.8) for the supposed cotyle. Its system is—

cotyle,	4 = hemihecton,	4 = chous,	3 = (*n*).
58 cub. in.	232	932	2796

And with this agrees a pottery cylindrical vessel, with official stamp on it (ΔΗΜΟΣΙΟΝ, etc.), and having a fine black line traced round the inside, near the top, to show its limit; this seems to be probably very accurate, and contains 58.5 cubic inches, closely agreeing with the cotyle of Gythium. It has been described (*Rev. Arch.*, 1872) as an Attic chœnix. Gythium being the southern port of Greece, it seems not too far to connect this 58 cubic inches with the double of the Egyptian hon = 58.4, as it is different from every other Greek system.

Roman System.—The celebrated Farnesian standard congius of bronze of Vespasian, "mensuræ exactæ in Capitolio P. X.," contains 206.7 cubic inches (2), and hence the amphora 1654. By the sextarius of Dresden (2) the amphora is 1695; by the congius of Ste. Geneviève (2) 1700 cubic inches; and by the ponderarium measures at Pompeii (33) 1540 to 1840, or about 1620 for a mean. So the Farnesian congius, or about 1650, may best be adopted. The system for liquid was—

quartarius,	4 = sextarius,	6 = congius.	4 = urna,
8.6 cub. ins.	34.4	206	825

2 = amphora;
1650

for dry measure 16 sextarii = modius, 550 cubic inches; and to both systems were added from the Attic the cyathus (2.87), acetabulum (4.3), and hemina (17.2 cubic inches). The Roman theory of the amphora being the cubic foot makes it 1569 cubic inches, or decidedly less than the actual measures; the other theory of its containing 80 libræ of water would make it 1575 by the commercial or 1605 by the monetary libra,—again too low for the measures. Both of these theories therefore are rather working equivalents than original derivations; or at least the interrelation was allowed to become far from exact.

Indian and Chinese Systems.—On the ancient Indian system see *Numismata Orientalia*, new ed., i. 24; on the ancient Chinese, *Nature*, xxx. 565, and xxxv. 318.

STANDARDS OF WEIGHT.—For these we have far more complete data than for volumes or even lengths, and can ascertain in many cases the nature of the variations, and their type in each place. The main series on which we shall rely here are those—(1) from Assyria (38) about 800 B.C.; (2) from the eastern Delta of Egypt (29) (Defenneh); (3) from western Delta (28) (Naucratis); (4) from Memphis (44),—all these about the 6th century B.C., and therefore before much interference from the decreasing coin standards; (5) from Cnidus; (6) from Athens; (7) from Corfu; and (8) from Italy (British Museum) (44). As other collections are but a fraction of the whole of these, and are much less completely examined, little if any good would be done by including them in the combined results, though for special types or inscriptions they will be mentioned.

146 grains.—The Egyptian unit was the kat, which varied between 138 and 155 grains (28, 29). There were several families or varieties within this range, at least in the Delta, probably five or six in all (29). The original places and dates of these cannot yet be fixed, except for the lowest type of 138–140 grains; this belonged to Heliopolis (7), as two weights (35) inscribed of "the treasury of An" show 139.9 and 140.4, while a plain one from there gives 138.8; the variety 147—149 may belong to Hermopolis (35), according to an inscribed weight. The names of the kat and tema are fixed by being found on weights, the uten by inscriptions; the series was—

(*n*),	10 = kat,	10 = uten,	10 = tema.
14.6 grs.	146	1460	14,600

The tema is the same name as the large wheat measure (35) which was worth 30,000 to 19,000 grains of copper, according to Ptolemaic receipts and accounts (*Rev. Eg.*, 1881, 150), and therefore very likely worth 10 utens of copper in earlier times when metals were scarcer. The kat was regularly divided into 10: but another division, for the sake of interrelation with another system, was in $\frac{1}{3}$ and $\frac{1}{8}$, scarcely found except in the eastern Delta, where it is common (29); and it is known from a papyrus (38) to be a Syrian weight. The uten is found ÷ 6 = 245, in Upper Egypt (rare) (44). Another division (in a papyrus) (38) is a silver weight of $\frac{6}{10}$ kat = about 88,—perhaps the Babylonian siglus of 86. The uten was also binarily divided into 128 peks of gold in Ethiopia; this may refer to another standard (see 129) (33). The Ptolemaic copper coinage is on two bases,—the uten, binarily divided, and the Ptolemaic five shekels (1050), also binarily divided. (This result is from a larger number than other students have used, and study by diagrams). The theory (3) of the derivation of the uten from $\frac{1}{1500}$ cubic cubit of water would fix it at 1472, which is accordant; but there seems no authority either in volumes or weights for taking 1500 utens. Another theory (3) derives the uten from $\frac{1}{1000}$ of the cubic cubit of 24 digits, or better $\frac{8}{9}$ of 20.63; that, however, will only fit the very lowest variety of the uten, while there is no evidence of the existence of such a cubit. The kat is not unusual in Syria (44), and among the hæmatite weights of Troy (44) are nine examples, average 144, but not of extreme varieties.

129 grs.; **258** grs.
7750; 15,500;
465,000.

The great standard of Babylonia became the parent of several other systems; and itself and its derivatives became more widely spread than any other standard. It was known in two forms,—one system (24) of—

um,	60 = sikhir,	6 shekel,	10 = stone,	6 = maneh,
.36 grs.	21.5	129	1290	7750
		60 = talent :		
		465,000		

and the other system double of this in each stage except the talent. These two systems are distinctly named on the weights, and are known now as the light and heavy Assyrian systems (19, 24). (It is better to avoid the name Babylonian, as it has other meanings also.) There are no weights dated before the Assyrian bronze lion weights (9, 17, 19, 38) of the 11th to 8th centuries B.C. Thirteen of this class average 127.2 for the shekel; 9 hæmatite barrel-shaped weights (38) give 128.2; 16 stone duck-weights (38), 126.5. A heavier value is shown by the precious metals,—the gold plates from Khorsabad (18) giving 129, and the gold daric coinage (21, 35) of Persia 129.2. Nine weights from Syria (44) average 128.8. This is the system of the "Babylonian" talent, by Herodotus = 70 minæ Euboic, by Pollux = 70 minæ Attic, by Ælian = 72 minæ Attic, and therefore about 470,000 grains. In Egypt this is found largely at Naucratis (28, 29), and less commonly at Defenneh (29). In both places the distribution, a high type of 129 and a lower of 127, is like the monetary and trade varieties above noticed; while a smaller number of examples are found, fewer and fewer, down to 118 grains. At Memphis (44) the shekel is scarcely known, and a ½ mina weight was there converted into another standard (of 200). A few barrel weights are found at Karnak, and several egg-shaped shekel weights at Gebelen (44); also two cuboid weights from there (44) of 1 and 10 utens are marked as 6 and 60, which can hardly refer to any unit but the heavy shekel, giving 245. Hultsch refers to Egyptian gold rings of Dynasty XVIII. of 125 grains. That this unit penetrated far to the south in early times is shown by the tribute of Kush (34) in Dynasty XVIII.; this is of 801, 1443, and 23,741 kats, or 15 and 27 manehs and 7½ talents when reduced to this system. And the later Ethiopic gold unit of the pek (7), or $\frac{1}{128}$ of the uten, was 10.8 or more, and may therefore be the ½ sikhir or obolos of 21.5. But the fraction $\frac{1}{128}$, or a continued binary division repeated seven times, is such a likely mode of rude subdivision that little stress can be laid on this. In later times in Egypt a class of large glass scarabs for funerary purposes seem to be adjusted to the shekel (30). Whether this system or the Phœnician on 224 grains was that of the Hebrews is uncertain. There is no doubt but that in the Maccabean times and onward 218 was the shekel; but the use of the word darkemôn by Ezra and Nehemiah, and the probabilities of their case, point to the darag-maneh, $\frac{1}{60}$ maneh, or shekel of Assyria; and the mention of ⅓ shekel by Nehemiah as poll tax nearly proves that the 129 and not 218 grains is intended, as 218 was never ÷ 3. But the Maccabean use of 218 may have been a reversion to the older shekel; and this is strongly shown by the fraction ¼ shekel (1 Sam. ix. 8), the continual mention of large decimal numbers of shekels in the earlier books, and the certain fact of 100 shekels being = mina. This would all be against the 129 or 258 shekel, and for the 218 or 224. There is, however, one good datum if it can be trusted; 300 talents of silver (2 Kings xviii. 14) are 800 talents on Sennacherib's cylinder (34), while the 30 talents of gold is the same in both accounts. Eight hundred talents on the Assyrian silver standard would be 267—or roundly 300—talents on the heavy trade or gold system, which is therefore probably the Hebrew. Probably the 129 and 224 systems coexisted in the country; but on the whole it seems more likely that 129 or rather 258 grains was the Hebrew shekel before the Ptolemaic times,—especially as the 100 shekels to the mina is paralleled by the following Persian system (Hultsch)—

$$\text{shekel,}\begin{cases}50 = \text{mina}\ldots\ldots\ldots\quad 60 = \text{talent of gold}\\ 60 = \ldots\ldots\ldots\text{mina}\ldots\ldots\ldots\ldots\ldots\ldots\ldots\quad 60 = \text{talent of trade,}\end{cases}$$

129 grs. 6450 7750 387,000 465,000

the Hebrew system being

gerah,	20 = shekel,	100 = maneh,	30 = talent,
12.9 grs.	258 ?	25,800	774,000

and, considering that the two Hebrew cubits are the Babylonian and Persian units, and the volumes are also Babylonian, it is the more likely that the weights should have come with these. From the east this unit passed to Asia Minor; and six multiples of 2 to 20 shekels (av. 127) are found among the hæmatite weights of Troy (44), including the oldest of them. On the Ægean coast it often occurs in early coinage (17),—at Lampsacus 131–129, Phocæa 256–4, Cyzicus 252–247, Methymna 124.6, etc. In later times it was a main unit of North Syria, and also on the Euxine, leaden weights of Antioch (3), Callatia, and Tomis being known (38). The mean of these eastern weights is 7700 for the mina, or 128. But the leaden weights of the west (44) from Corfu, etc., average 7580, or 126.3; this standard was kept up at Cyzicus in trade long after it was lost in coinage. At Corinth the unit was evidently the Assyrian and not the Attic, being 129.6 at the earliest (17) (though modified to double Attic, or 133, later) and being ÷ 3, and not into 2 drachms. And this agrees with the mina being repeatedly found at Corcyra, and with the same standard passing to the Italian coinage (17) similar in weight, and in division into ⅓,—the heaviest coinages (17) down to 400 B.C. (Terina, Velia, Sybaris, Posidonia, Metapontum, Tarentum, etc.) being none over 126, while later on many were adjusted to the Attic, and rose to 134. Six disk weights from Carthage (44) show 126. It is usually the case that a unit lasts later in trade than in coinage; and the prominence of this standard in Italy may show how it is that this mina (18 unciæ = 7400) was known as the "Italic" in the days of Galen and Dioscorides (2).

126 grs.
6300.

A variation on the main system was made by forming a mina of 50 shekels. This is one of the Persian series (gold), and the ¼ of the Hebrew series noted above. But it is most striking when it is found in the mina form which distinguishes it. Eleven weights from Syria and Cnidus (44) (of the curious type with two breasts on a rectangular block) show a mina of 6250 (125.0); and it is singular that this class is exactly like weights of the 224 system found with it, but yet quite distinct in standard. The same passed into Italy and Corfu (44), averaging 6000,—divided in Italy into unciæ ($\frac{1}{12}$), and scripulæ ($\frac{1}{288}$), and called litra (in Corfu ?). It is known in the coinage of Hatria (18) as 6320. And a strange division of the shekel in 10 (probably therefore connected with this decimal mina) is shown by a series of bronze weights (44) with four curved sides and marked with circles (British Museum, place unknown), which may be Romano-Gallic, averaging 125 ÷ 10. This whole class seems to cling to sites of Phœnician trade, and to keep clear of Greece and the north,—perhaps a Phœnician form of the 129 system, avoiding the sexagesimal multiples.

If this unit have any connection with the kat, it is that a kat of gold is worth 15 shekels or ¼ mina of silver; this agrees well with the range of both units, only it must be remembered that 129 was used as gold unit, and another silver unit deduced from it. More likely then the 147 and 129 units originated independently in Egypt and Babylonia.

86 grs.
8600;
516,000

From 129 grains of gold was adopted an equal value of silver = 1720, on the proportion of 1 : 13⅓, and this was divided in 10 = 172,—which was used either in this form, or its half, 86, best known as the siglus (17). Such a proportion is indicated in Num. vii., where the gold spoon of 10 shekels is equal in value to the bowl of 130 shekels, or double that of 70, *i.e.*, the silver vessels were 200 and 100 sigli. The silver plates at Khorsabad (18) we find to be 80 sigli of 84.6. The Persian silver coinage shows about 86.0; the danak was ⅓ of this, or 28.7. Xenophon and others state it at about 84. As a monetary weight it seems to have spread, perhaps entirely, in consequence of the Persian dominion; it varies from 174. downwards, usually 167, in Aradus, Cilicia, and on to the Ægean coast, in Lydia and in Macedonia (17). The silver bars found at Troy averaging 2744, or ⅓ mina of 8232, have been attributed to this unit (17); but no division of the mina in ⅓ is to be expected, and the average is rather low. Two hæmatite weights from Troy (44) show 86 and 87.2. The mean from leaden weights of Chios, Tenedos (44), etc., is 8430. A duck-weight of Camirus, probably early, gives 8480; the same passed on to Greece and Italy (17) averaging 8610; but in Italy it was divided, like all other units, into unciæ and scripulæ (44). It is perhaps found in Etrurian coinage as 175–172 (17). By the Romans it was used on the Danube (18), two weights of the first legion there showing 8610; and this is the mina of 20 unciæ (8400) named by Roman writers. The system was—

obol.	6 = siglus,	100 = mina,	60 = talent.
14.3 grs.	86	8600	516,000

A derivation from this was the ⅓ of 172, or 57.3, the so-called Phocæan drachma, equal in silver value to the $\frac{1}{60}$ of the gold 258 grains. It was used at Phocæa as 58.5, and passed to the colonies of Posidonia and Velia as 59 or 118. The colony of Massilia brought it into Gaul as 58.2–54.9.

224 grs.
11,200;
672,000.

That this unit (commonly called Phœnician) is derived from the 129 system can hardly be doubted, both being so intimately associated in Syria and Asia Minor. The relation is 258 : 229 : : 9 : 8; but the exact form in which the descent took place is not settled: $\frac{1}{30}$ of 129 of gold is worth 57 of silver or a drachm, ¼ of 230 (or by trade weights 127 and 226); otherwise, deriving it from the silver weight of 86 already formed, the drachm is ⅓ of the stater, 172, or double of the Persian danak of 28.7, and the sacred unit of Didyma in Ionia was this half drachm, 27; or thirdly, what is indicated by the Lydian coinage (17), 86 of gold was equal to 1150 of silver, 5 shekels, or $\frac{1}{10}$ mina. Other proposed derivations from the kat or pek are not satisfactory. In actual use this unit varied greatly: at Naucratis (29) there are groups of it at 231, 223, and others down to 208; this is the earliest form in which we can study it, and the corresponding values to these are 130 and 126, or the gold and trade varieties of the Babylonian, while the lower tail down to 208 corresponds to the shekel down to 118, which is just what is found. Hence the 224 unit seems to have been formed from the 129, after the main families or types of that had arisen. It is scarcer at Defenneh (29) and rare at Memphis (44). Under the Ptolemies, however, it became the great unit of Egypt, and is very prominent in the later literature in consequence (18, 35). The average of coins (21) of Ptolemy I. gives 219.6, and thence they gradually diminish to 210, the average (33) of the whole series of Ptolemies being 218. The "argenteus" (as Revillout transcribes a sign in the papyri) (35) was of 5 shekels, or 1090; it arose about 440 B.C., and became after 160 B.C. a weight unit for copper. In Syria, as early as the 15th century B.C., the tribute of the Rutennu, of Naharaina, Megiddo, Anaukasa, etc. (34), is on a basis of 454–484 kats, or 300 shekels ($\frac{1}{10}$ talent) of 226 grains. The commonest weight at Troy (44) is the shekel, averaging 224. In coinage it is one of the commonest units in early times; from Phœnicia, round the coast to Macedonia, it is predominant (17); at a maximum of 230 (Ialysus), it is in Macedonia 224, but seldom exceeds 220 elsewhere, the earliest Lydian of the 7th century being 219, and the general average of coins 218. The system was—

($\frac{1}{8}$).	8 = drachm,	4 = shekel,	25 = mina,	120 = talent.
7 grs.	56	224	5600	672,000

From the Phœnician coinage it was adopted for the Maccabean. It is needless to give the continual evidences of this being the later Jewish shekel, both from coins (max. 223) and writers (2, 18, 33); the question of the early shekel we have noticed already under 129. In Phœnicia and Asia Minor the mina was specially made in the form with two breasts (44), 19 such weights averaging 5600 (= 224); and thence it passed into Greece, more in a double value of 11,200 (= 224). From Phœnicia this naturally became the main Punic unit; a bronze weight from Iol (18), marked 100, gives a drachma of 56 or 57 (224-228); and a Punic inscription (18) names 28 drachmæ = 25 Attic, and ∴ 57 to 59 grains (228–236); while a probably later series of 8 marble disks from Carthage (44) show 208, but vary from 197 to 234. In Spain it was 236 to 216 in different series (17), and it is a question whether the Massiliote drachmæ of 58–55 are not Phœnician rather than Phocaic. In Italy this mina became naturalized, and formed the "Italic mina" of Hero, Priscian, etc.; also its double, the mina of 26 unciæ or 10,800 = 50 shekels of 216; the average of 42 weights gives 5390 (= 215.6), and it was divided both into 100 drachmæ, and also in the Italic mode of 12 unciæ and 288 scripulæ (44). The talent was of 120 minæ of 5400, or 3000 shekels, shown by the talent from Herculaneum, TA, 660,000 and by the weight inscribed PONDO CXXV. (*i.e.*, 125 libræ) TALENTUM SICLORVM, iii. *i.e.*, talent of 3000 shekels (2) (the M being omitted; just as Epiphanius describes this talent as 125 libræ, or θ (= 9) nomismata, for 9000). This gives the same approximate ratio 96 : 100 to the libra as the usual drachma reckoning. The Alexandrian talent of Festus, 12,000 denarii, is the same talent again. It is believed that this mina ÷ 12 unciæ by the Romans is the origin of the Arabic ratl of 12 úkíyas, or 5500 grains (33), which is said to have been sent by Harun al-Rashid to Charlemagne, and so to have originated the French monetary pound of 5666 grains. But as this is probably the same as the English monetary pound, or tower pound of 5400, which was in use earlier (see Saxon coins), it seems more likely that this pound (which is common in Roman weights) was directly inherited from the Roman civilization.

80 grs.
4000;
400,000.

Another unit, which has scarcely been recognized in metrology hitherto, is prominent in the weights from Egypt,—some 50 weights from Naucratis and 15 from Defenneh plainly agreeing on this and on no other basis. Its value varies between 76.5 and 81.5,—mean 79 at Naucratis (29) or 81 at Defenneh (29). It has been connected theoretically with a binary division of the 10 shekels or "stone" of the Assyrian systems (28), 1290 ÷ 16 being 80.6; this is suggested by the most usual multiples being 40 and 80 = 25 and 50 shekels of 129; it is thus akin to the mina of 50 shekels previously noticed. The tribute of the Asi, Rutennu, Khita, Assaru, etc., to Thothmes III. (34), though in uneven numbers of kats, comes out in round thousands of units when reduced to this standard. That this unit is quite distinct from the Persian 86 grains is clear in the Egyptian weights, which maintain a wide gap between the two systems. Next, in Syria three inscribed weights of Antioch and Borytus (18) show a mina of about 16,400, or 200 × 82. Then at Abydus, or more probably from Babylonia, there is the large bronze lion-weight, stated to have been originally 400,500 grains; this has been continually ÷ 60 by different writers, regardless of the fact (*Rev. Arch.*, 1862, 30) that it bears the numeral 100; this therefore is certainly a talent of 100 minæ of 4005; and as the mina is generally 50 shekels in Greek systems it points to a weight of 80.1. Farther west the same unit occurs in several Greek weights (44) which show a mina of 7800 to 8310, mean 8050 ÷ 100 = 80.5. Turning to coinage we find this often, but usually overlooked as a degraded form of the Persian 86 grains siglos. But the earliest coinage in Cilicia, before the general Persian coinage (17) about 380 B.C., is Tarsus, 164 grains; Soli, 169, 163, 158; Nagidus, 158, 161–153 later; Issus, 166; Mallus, 163–154,—all of which can only by straining be classed as Persian; but they agree to this standard, which, as we have seen, was used in Syria in earlier times by the Khita, etc. The Milesian or "native" system of Asia Minor (18) is fixed by Hultsch at 163 and 81.6 grains,—the coins of Miletus (17) showing 160, 80, and 39. Coming down to literary evidence, this is abundant. Böckh decides that the "Alexandrian drachma" was $\frac{6}{5}$ of the Solonic 67, or = 80.5, and shows that it was not Ptolemaic, or Rhodian, or Æginetan, being distinguished from these in inscriptions (2). Then the "Alexandrian mina" of Dioscorides and Galen (2) is 20 unciæ = 8250; in the "Analecta" (2) it is 150 or 158 drachmæ = 8100. Then Attic: Euboic or Æginetan : : 18 : 25 in the metrologists (2), and the Euboic talent = 7000 "Alexandrian" drachmæ; the drachma therefore is 80.0. The "Alexandrian" wood talent : Attic talent : : 6 : 5 (Hero, Didymus), and ∴ 480,000, which is 60 minæ of 8000. Pliny states the Egyptian talent at 80 libræ = 396,000, evidently = the Abydus lion talent, which is ÷ 100, and the mina is ∴ 3960, or 50 × 79.2. The largest weight is the "wood" talent of Syria (18) = 6 Roman talents, or 1,860.000, evidently 120 Antioch minæ of 15,500 or 2 × 7750. This evidence is too distinct to be set aside; and, exactly confirming as it does the Egyptian weights and coin weights, and agreeing with the early Asiatic tribute, it cannot be overlooked in future. The system was

drachm	2 = stater,	50 = mina,	{ 50 = talent,	60 = Greek talent,
80 grs.	160	8000	400,000	480,000

207 grs. to
190 9650;
579,000.

This system, the Æginetan, one of the most important to the Greek world, has been thought to be a degradation of the Phœnician (17, 21), supposing 220 grains to have been reduced in primitive Greek usage to 194. But we are now able to prove that it was an independent system—(1) by its not ranging usually over 200 grains in Egypt before it passed to Greece; (2) by its earliest example, perhaps before the 224 unit existed, not being over 208; and (3) by there being no intermediate linking on of this to the Phœnician unit in the large number of Egyptian weights, nor in the Ptolemaic coinage, in which both standards are used. The first example (30) is one with the name of Amenhotep I. (17th century B. C.) marked as "gold 5," which is 5 × 207.6. Two other marked weights are from Memphis (44), showing 201.8 and 196.4, and another Egyptian 191.4. The range of the (34) Naucratis weights is 186 to 199, divided in two groups averaging 190 and 196, equal to the Greek monetary and trade varieties. Ptolemy I. and II. also struck a series of coins (32) averaging 199. In Syria hæmatite weights are found (30) averaging 198.5, divided into 99.2, 49.6, and 24.8; and the same division is shown by gold rings from Egypt (38) of 24.9. In the medical papyrus (38) a weight of $\frac{2}{3}$ kat is used, which is thought to be Syrian; now $\frac{2}{3}$ kat = 92 to 101 grains, or just this weight which we have found in Syria; and the weights of $\frac{2}{3}$ and $\frac{1}{3}$ kat are very rare in Egypt except at Defenneh (29), on the Syrian road, where they abound. So we have thus a weight of 207–191 in Egypt on marked weights, joining therefore completely with the Æginetan unit in Egypt of 199 to 186, and coinage of 199, and strongly connected with Syria, where a double mina of Sidon (18) is 10,460 or 50 × 209.2. Probably before any Greek coinage we find this among the hæmatite weights of Troy (44), ranging from 208 to 193.2 (or 104-96.6), *i.e.*, just covering the range from the earliest Egyptian down to the early Æginetan coinage. Turning now to the early coinage, we see the fuller weight kept up (17) at Samos (202), Miletus (201), Calymna (100, 50), Methymna and Scepsis (99, 49),[1] Ionia (197); while the coinage of Ægina (17, 12), which by its wide diffusion made this unit best known, though a few of its earliest staters go up even to 207, yet is characteristically on the lower of the two groups which we recognize in Egypt, and thus started what has been considered the standard value of 194, or usually 190, decreasing afterwards to 184. In later times, in Asia, however, the fuller weight, or higher Egyptian group, which we have just noticed in the coinage, was kept up (17) into the series of cistophori (196–191), as in the Ptolemaic series of 199. At Athens the old mina was fixed by Solon at 150 of his drachmæ (18) or 9800 grains, according to the earliest drachmæ, showing a stater of 196; and this continued to be the trade mina in Athens, at least until 160 B.C., but in a reduced form, in which it equalled only 138 Attic drachmæ, or 9200. The Greek mina weights show (44), on an average of 37, 9650 (= stater of 193), varying from 186 to 199. In the Hellenic coinage it varies (18) from a maximum of 200 at Pharæ to 192, usual full weight; this unit occupied (17) all central Greece, Peloponnesus, and most of the islands. The system was—

---

[1] That this unit was used for gold in Egypt, one thousand years before becoming a silver coin weight in Asia Minor, need not be dwelt on, when we see in the coinage of Lydia (17) gold pieces and silver on the same standard, which was expressly formed for silver alone, *i.e.*, 84 grains. The Attic and Assyrian standards were used indifferently for either gold or silver.

obol.	6 = drachm,	2 = stater,	50 = mina,	60 = talent.
16 grs.	96	192	9600	576,000

It also passed into Italy, but in a smaller multiple of 25 drachmæ, or ¼ of the Greek mina; 12 Italian weights (44) bearing value marks (which cannot therefore be differently attributed) show a libra of 2400 or ¼ of 9600, which was divided in unciæ and sextulæ, and the full-sized mina is known as the 24 uncia mina, or talent of 120 libræ of Vitruvius and Isidore (18) = 9900. Hultsch states this to be the old Etruscan pound.

412
4950 grs.

With the trade mina of 9650 in Greece, and recognized in Italy, we can hardly doubt that the Roman libra is the half of this mina. At Athens it was 2 × 4900, and on the average of all the Greek weights it is 2 × 4825, so that 4950—the libra—is as close as we need expect. The division by 12 does not affect the question, as every standard that came into Italy was similarly divided. In the libra, as in most other standards, the value which happened to be first at hand for the coinage was not the mean of the whole of the weights in the country; the Phœnician coin weight is below the trade average, the Assyrian is above, the Æginetan is below, but the Roman coinage is above the average of trade weights, or the mean standard. Rejecting all weights of the lower empire, the average (44) of about 100 is 4956; while 42 later Greek weights (nomisma, etc.) average 4857, and 16 later Latin ones (solidus, etc.) show 4819. The coinage standard however, was always higher (18); the oldest gold shows 5056, the Campanian Roman 5054, the consular gold 5037, the aurei 5037, the Constantine solidi 5053, and the Justinian gold 4996. Thus, though it fell in the later empire, like the trade weight, yet it was always above that. Though it has no exact relation to the congius or amphora, yet it is closely = 4977 grains, the $\frac{1}{80}$ of the cubic foot of water. If, however, the weight in a degraded form, and the foot in an undegraded form, come from the East, it is needless to look for an exact relation between them, but rather for a mere working equivalent, like the 1000 ounces to the cubic foot in England. Böckh has remarked the great diversity between weights of the same age,—those marked "Ad Augusti Temp" ranging 4971 to 5535, those tested by the fussy præfect Q. Junius Rusticus vary 4362 to 5625, and a set in the British Museum (44) belonging together vary 4700 to 5168. The series was—

siliqua,	6 = scripulum,	4 = sextula,	6 = uncia,	12 = libra,
2.87 grs.	17.2	68.7	412	4950

the greater weight being the centumpondium of 495,000. Other weights were added to these from the Greek system—

obolus,	6 = drachma,	2 = sicilicus,	4 = uncia;
8.6 grs.	51.5	103	412

and the sextula after Constantine had the name of solidus as a coin weight, or nomisma in Greek, marked N on the weights. A beautiful set of multiples of the scripulum was found near Lyons (38), from 1 to 10 × 17.28 grains, showing a libra of 4976. In Byzantine times in Egypt glass was used for coin-weights (30), averaging 68.0 for the solidus = 4896 for the libra. The Saxon and Norman ounce is said to average 416.5 (*Num. Chron.*, 1871, 42), apparently the Roman uncia inherited.

67 grs.
6700;
402,000.

The system which is perhaps the best known, through its adoption by Solon in Athens, and is thence called Attic or Solonic, is nevertheless far older than its introduction into Greece, being found in full vigor in Egypt in the 6th century B.C. It has been usually reckoned as a rather heavier form of the 129 shekel, increased to 134 on its adoption by Solon. But the Egyptian weights render this view impossible. Among them (29) the two contiguous groups can be discriminated by the 129 being multiplied by 30 and 60, while the 67 or 134 is differently × 25, 40, 50, and 100. Hence, although the two groups overlap owing to their nearness, it is impossible to regard them as all one unit. The 129 range is up to 131.8, while the Attic range is 130 to 138 (65–69). Hultsch reckons on a ratio of 24 : 25 between them, and this is very near the true values; the full Attic being 67.3, the Assyrian should be 129.2, and this is just the full gold coinage weight. We may perhaps see the sense of this ratio through another system. The 80 grain system, as we have seen, was probably formed by binarily dividing the 10 shekels, or "stone;" and it had a talent (Abydus lion) of 5000 drachmæ; this is practically identical with the talent of 6000 Attic drachmæ. So the talent of the 80 grain system was sexagesimally divided for the mina which was afterwards adopted by Solon. Such seems the most likely history of it, and this is in exact accord with the full original weight of each system. In Egypt the mean value at Naucratis (29) was 66.7, while at Defenneh (29) and Memphis (44)—probably rather earlier—it was 67.0. The type of the grouping is not alike in different places, showing that no distinct families had arisen before the diffusion of this unit in Egypt; but the usual range is 65.5 to 69.0. Next it is found at Troy (44) in three cases, all high examples of 68.2 to 68.7; and these are very important, since they cannot be dissociated from the Greek Attic unit and yet they are of a variety as far removed as may be from the half of the Assyrian, which ranges there from 123.5 to 131; thus the difference of unit between Assyrian and Attic in these earliest of all Greek weights is very strongly marked. At Athens a low variety of the unit was adopted for the coinage, true to the object of Solon in depreciating debts; and the first coinage is of only 65.2, or scarcely within the range of the trade weights (28); this seems to have been felt, as contrary to all other states, Athens slowly increased its coin weight up to 66.6, or but little under the trade average. It gradually supplanted the Æginetan standard in Greece and Italy as the power of Athens rose; and it was adopted by Philip and Alexander (17) for their great gold coinage of 133 and 66.5. This system is often known as the "Euboic," owing to its early use in Eubœa, and its diffusion by trade from thence. The series was—

chalcous,	8 = obolus,	6 = drachma,	100 = mina,	60 = talanton.
1.4 grs.	11.17	67	6700	402,000

Turning now to its usual trade values in Greece (44), the mean of 113 gives 67.15; but they vary more than the Egyptian examples, having a sub-variety both above and below the main body, which itself exactly coincides with the Egyptian weights. The greater part of those weights which bear names indicate a mina of double the usual reckoning, so that there was a light and a heavy system, a mina of the drachma and a mina of the stater, as in the Phœnician and Assyrian weights. In trade both the minæ were divided in ½, ¼, ⅛, ⅓, and ⅙, regardless of the drachmæ. This unit passed also into Italy, the libra of Picenum and the double of the Etrurian and Sicilian libra (17); it was there divided in unciæ and scripulæ (44), the mean of 6 from Italy and Sicily being 6600; one weight (bought in Smyrna) has the name "Leitra" on it. In literature it is constantly referred to; but we may notice the "general mina" (Cleopatra), in Egypt, 16 unciæ = 6600; the Ptolemaic talent, equal to the Attic in weight and divisions (Hero, Didymus); the Antiochian talent, equal to the Attic (Hero); the treaty of the Romans with Antiochus, naming talents of 80 libræ, *i.e.*, mina of 16 unciæ; the Roman mina in Egypt, of 15 unciæ, probably the same diminished; and the Italic mina of 16 unciæ. It seems even to have lasted in Egypt till the Middle Ages, as Jabarti and the "kátíb's guide" both name the ratl misri (of Cairo) as 144 dirhems = 6760.

We have now ended our outline of ancient metrology, omitting all details that were not really necessary to a fair judgment on the subject, but trying to make as plain as possible the actual bases of information, to trust to no opinions apart from facts, and to leave what is stated as free as possible from the influence of theorics. Theoretical values have nowhere been adopted here as the standards, contrary to the general practice of metrologists; but in each case the standard value is stated solely from the evidence in hand, quite regardless of how it will agree with the theoretical deduction from other weights or measures. Great refinement in statements of values is needless, looking to the uncertainties which beset us. There are innumerable theories unnoticed here; only those are explained which seem to have a reasonable likelihood, and others are only mentioned where it is needful to show that they have not been overlooked. In many cases fuller detail is given of less important points, when they have not been published before, and no other information can be referred to elsewhere; when any point is abundantly proved and known, it has been passed with a mere mention. Finally, to indicate where further information on different matters may be found reference is frequently made by a number to the list of works given below, some early and other works being omitted, of which all the data will be found in later books.

For historical reference we may state the following units legally abolished.

English Weights and Measures Abolished.—The yard and handful, or 40 inch ell, abolished in 1439. The yard and inch, or 37 inch ell (cloth measure), abolished after 1553; known later as the Scotch ell = 37.06. Cloth ell of 45 inches, used till 1600. The yard of Henry VII. = 35.963 inches. Saxon moneyers pound, or Tower pound, 5400 grains, abolished in 1527. Mark, $\frac{2}{3}$ pound = 3600 grains. Troy pound in use in 1415, established as monetary pound 1527, now restricted to gold, silver, and jewels, excepting diamonds and pearls. Merchant's pound, in 1270 established for all except gold, silver, and medicines = 6750 grains, generally superseded by avoirdupois in 1303. Merchant's pound of 7200 grains, from France and Germany, also superseded. ("Avoirdupois" occurs in 1336, and has been thence continued; the Elizabethan standard was probably 7002 grains.) Ale gallon of 1601 = 282 cubic inches, and wine gallon of 1707 = 231 cubic inches, both abolished in 1824. Winchester corn bushel of 8 × 268.8 cubic inches and gallon of $274\frac{1}{4}$ are the oldest examples known (Henry VII.), gradually modified until fixed in 1826 at 277.274, or 10 pounds of water.

French Weights and Measures Abolished.—Often needed in reading older works.

ligne.	12 = pouce,	12 = pied,	6 = toise,	2000 = lieue de poste.
.08883 in.	1.0658	12.7892	76.735	2.42219 miles.

grain,	72 = gros,	8 = once,	8 = marc,	2 = poids de marc.
.8197 gr.	59.021	472.17	3777.33	1.0792 lb.

Rhineland foot, much used in Germany, = 12.357 inches = the foot of the Scotch or English cloth ell of 37.06 inches, or 3 × 12.353.

III. Commercial.

In this section we shall only refer to such measures as are in actual use at the present time; the various systems of the Continental towns have been superseded by the metric system now in force, and are therefore not needed now except for historical purposes.

English weights and measures.

Great Britain.—Length:

inch,	12 = foot,	3 = yard,	$5\frac{1}{2}$ = pole,
1 in.	12	36	198

4 = chain,	10 = furlong,	8 = mile.
792	7920	63360

Hand, 4 inches; fathom, 2 yards; knot or geographical mile = 1′ = 1.1507 miles. The chain is divided in 100 links for land measure; link = 7.92 inches.

Terms of square measure are squares of the long measures.

Volume: dry:

	pint,	2 = quart,	4 = gallon,	2 = peck,	4 = bushel,	8 = quarter
cub. in.	34.659	69.318	277.274	554.548	2218.19	17745.6

Gill = $\frac{1}{4}$ pint; pottle = 2 quarts; 5 quarters = wey or load; 2 weys = last.

Volume: wet:

Pint and quart as above gallon,	9 = firkin	4 = barrel or hogshead,	2 = pipe, butt, or puncheon.
cub. ins. 277.274	2495.5	9981.9	19963.8

Avoirdupois weight, for everything not excepted below:

drachm,	16 = ounce,	16 = pound,	14 = stone,
27.3 grains.	437.5	7000	98,000

2 = quarter,	4 = hundred,	20 = ton.
196,000 grs.	112 lb.	2240 lb.

Troy weight (gold, silver, platinum, and jewels, except diamonds and pearls):

grain,	24 = pennyweight,	20 = ounce,	12 = pound.
1 grain	24	480	5760

Diamond and pearl weight:

grain,	4 = carat,	150 = ounce Troy.
.8 grain	3.2	480

Apothecaries' dispensing weight, for prescriptions only:

grain,	20 = scruple,	3 = drachm,	8 = ounce,	12 = pound.
1 grain	20	60	480	5760

Apothecaries' fluid measure:

minim,	60 = drachm,	8 = ounce,	20 = pint,	8 = gallon.
.91 gr., water	54.7	437.5	8,750	70,000
.036 cub. in.	.216	1.733	34.659	277.274

Metric system.

Metric System.—The report to the French National Assembly proposing this system was presented 17th March, 1791, the meridian measurements finished and adopted 22d June, 1799, an intermediate system of division and names tolerated 28th May, 1812, abolished and pure decimal system enforced 1st January, 1840. Since then Netherlands, Spain (1850), Italy, Greece, Austria (legalized 1876), Germany, Norway and Sweden (1878), Switzerland, Portugal, Mexico, Venezuela, Argentine Republic, Hayti, New Grenada, Mauritius, Congo Free State, and other states have adopted this system. The use of it is permissive in Great Britain, India, Canada, Chili, etc. The theory of the system is that the metre is a 10,000,000th of a quadrant of the earth through Paris; the litre is a cube of $\frac{1}{10}$ metre; the gramme is $\frac{1}{1000}$ of the litre filled with water at 4° C.; the franc weighs 5 grammes. The multiples are as follows:

Table I.

British.	France.	Netherlands.	Other Names.
.039 inch	millimetre	streep	strich
.394 "	centimetre	duim	zentimeter
3.937 "	decimetre	palm	...
39.370 "	METRE	elle or aune	metre, stab
.62138 mile	kilometre	mijle	kilometer, stadion
.176 pint	decilitre	maatje	...
1.761 "	LITRE	kop	liter or kanne
17.608 "	decalitre	schepel	...
88.038 "	(50 litres)	...	scheffel
176.077 "	hectolitre	mudde	hektoliter, fasse, kilot
.015 grain	milligramme	...	...
15.43 "	GRAMME	wigtije	drom
154.32 "	decagramme	lood	loth
1543.23 "	hectogramme	ons	...
7716.17 "	(500 grammes)	...	pfund, livre
15432.35 "	kilogramme	pond	...
110.23 lb	(50 kilogr.)	...	zentner, zoll-centner
220.46 "	100 kilogr.	...	centner métrique, quintal
2204.62 "	1000 kilogr.	...	tonne, tonneau

In land measure the unit is the are (10 metres square) = 119.60 square yards; and the hectare = 2.4736 acres. Other multiples of the units are merely nominal and not practically used.

For approximate conversion either way use the following ratios: 8 metres = 315 inches (to $\frac{1}{10000}$); 8 kilometres = 5 miles (to $\frac{1}{170}$); 4 litres = 7 pints (to $\frac{1}{150}$); 7 grammes = 108 grains (to $\frac{1}{4000}$).

TABLE II.—*Table for Conversion of British and Metric Units.*

Inches.	Millimetres.	Metres.	Feet.	Cu. Inches.	Cubic Centimetres.	Cu. Metres.	Cubic Feet.
1	25.399	1	3.2809	1	16.386	1	35.316

9	5.10796	9	1.98220	9	.583190	9	24.1130

Burmah.—Paulgaut 1 inch, taim 18 inches, saundaung 22 inches, dha 154 inches, dain 2.43 miles. Kait 251 grains, vis 3.59 ℔, sait 14.36, ten 57.36, candy 533 ℔.

Candia.—Pic 25.11 inches, carga (corn) 4.19 bushels, rottolo 1.165 ℔, cantaro 116.5 ℔, okka 2.65 ℔.

Ceylon.—Seer 1.86 pints; 10 parrahs, 1 amomam, 5.6 bushels.

China.—Fau .141 inches, tsun 1.41, chik 14.1, cheung 141, yan 1410 = 117.5 feet. Other chiks—itinerary 12.17, imperial 12.61, surveyor's 12.70, Peking 13.12, Canton 14.70 inches. Li = 1800 chiks of 12.17, 13.12, or 14.1. Kop 3.3 cubic inches; 10 = shing tsong .96 pint, tau 9.6 (12 catties of water), hwuh 96 pints. Tael 580.3 grains; 16 = catty, 9328 grains or 1.333 ℔; picul 133.3 ℔.

Denmark.—Tomme 1.03 inches, fod 12.357, aln 24.714; miil 4.6807 miles. Pott .2126 gallons; 2 = kande, 2 = stübchen, 2 = viertel 1.7008 gallons; anker 8.2914 gallons. Pot .02657 bushel, skieppe .47835, fjerding .9567, tonne 3.8268, last 84.188 bushels. Ort 15.1 grains, quintin 60.3, lod 241.2, unze 482.5, mark 3860, pund 7720 = 1.103 ℔ = ½ kilogramme. Lispund 17.646 ℔, skippund 3.151 cwt. Tönde (land) 1.25 acres, (coal) 4.6775 bushels.

Egypt.—Dirá' of Nilometer 21.3 inches, dirá' beledi 22.7, dirá' handasi 25.13, pic or dirá Stambuli 27.65 inches; pic of land, 29.53, kasab 139.8 inches. Feddán 1$\frac{1}{20}$ acre. Rub'a 6.6 pint or quarts, wébe 6.6 gallons, ardeb 39.6 or 46.4 gallons. Dirhem 60.65 grains, ratl 1.0131 ℔, okka 2.7274 ℔, kantár 101.31 ℔.

India. — Bengal—gaz = yard. Bombay—gaz 27 inches, háth 18 inches. Madras—covid 18.6 inches. Bengal—cottah (katthá) 80 square yards; 20 = biggah, 1600 square yards. Madras — 24 mauris = cawri, 6400 square yards. Seer, 40 = maund, 20 = candy. Equivalents of Indian and other weights are given in Table III.

Bengal bazaar weights are $\frac{1}{10}$ greater than factory weights. Grain and native liquids are usually weighed.

Japan.—Boo, 10 = sun, 10 = shaku (11.948 inches = $\frac{10}{33}$ metre), 6 = ken, 60 = cho, 39 = ri (2.647 miles). Go (11.1 cubic inches), 10 = sho, 10 = to, 10 = koku (5.011 bushels). Momme 57.97 grains, 160 = kin or catty (1.325 ℔), 1000 momme = kuamme (8.281 ℔).

Java.—Ell 27¾ inches. Kanno .3282 gallon; rand, 396 = leaguer of arrack, 133¼ gallons; 360 rands = leaguer of wine. Rice—sack, 2 = picul 135⅝ ℔, 5 = timbang; coyang 3581 ℔.

Malacca.—Covid 18¼ inches; buncal 832 grains (gold and silver); kip 41 ℔ (tin); 100 catties = picul, 135 ℔; 3 piculs = bahar; 40 piculs = coyau of salt or rice; 500 gantons = 50 measures = 1 last, nearly 29 cwts.; chupah = 2½ ℔; gautang (= ganton?), 9 ℔ of water at 62°.

Malta.—Palmo 10.3 inches, foot 7.2 and 11.17 inches, canna 82.4 inches; 16 tumoli = salma, 4.44 acres. Caffiso (oil) 4.58 gallons; barile (wine) 9.16 gallons; salma (corn) 7.9 bushels. Ounce 407.2 grains; rottolo 1.745 ℔; cantaro 174.5 ℔.

Mexico.—Vara 32.97 inches. Fanega 1.50 bushels. Libra 1.0142 ℔.

Morocco.—Canna 21 inches; commercial rottolo 1.19 ℔, 100 = quintal; market rottolo 1.785 ℔.

Persia.—Gaz (gueze), 6 handbreadths or 25 inches. Royal gaz 37½ inches. Arash 38.27 inches. Parasang or farsakh 3 geographical miles (an hour's walk for a horse). Sextario (21 cubic inches), 4 = chenica, 2 = capicha (2.4 quarts), 25 = artaba (1.9 bushels). (These, as the native names show, are not native measures. As Chardin remarks, there are no true measures of capacity; even liquids are sold by weight). Dirhem, 143 (Bussora), 147.8 (Tabriz), or 150 grs. Mescal, 2 = dirhem, 50 = ratl (7300 grains), 6 = man or batman.

Russia.—Vershok (1.75 inches), 16 = archine, 3 = sagene (7 feet British, legally), 500 = verst (.663 mile); 2400 square sagenes = deciatine (2.7 acres). Tcharkey (.216 pint), 100 = vedro, 3 = anker, 40 vedros = sarakovaia (324.6 gallons). Garnietz, 2 = tchetverka, 4 = tchetverik, 2 = paiak, 2 = osmin, 2 = tchetvert, (5.77 bushels). Dola (.68578 grains); 96 = zolotnic; 8 = lana; 12 funt (6319.7279 grains); 40 = pud (36.112 ℔); 10 = berkovitz; 3 = packen. Also 3 zolotnices = 1 loth.

Siam.—Nin, 12 = küb (10 inches), 2 = sok, 4 = wa (79.999 inches on silver bar at 85° Fahr.). Thangsat, 10 × 10 × 20 nin, actual standard 1159.8477 cubic inches at 85° = 2.08 pecks. Thanan, 5×5×4 nin, standard 57.8800 at 85° = 1.67 pints. Tical or bat (234.04 grains), 4 = tael, 4 = catty or chang, 50 = picul or hap (133.738 ℔).

Turkey.—Pic 26.8 or 27.06 inches; larger pic 27.9. Almud 1.15 gallons (of oil = 8 okas); 4 killows = fortin of 3.7 bushels (killow of rice = 10 okas). Dram (49.5 grains), 100 = chequi, 4 = oka (2.8286 ℔); dram (49.5 grains), 180 = rotl, 100 = kintal or kantar (127.29 ℔).

United States.—Inch = 1.000049 British inch, and other measures in proportion. Gallon = .83292 British gallon. Bushel = .96946 British bushel. Weight, as Great Britain.

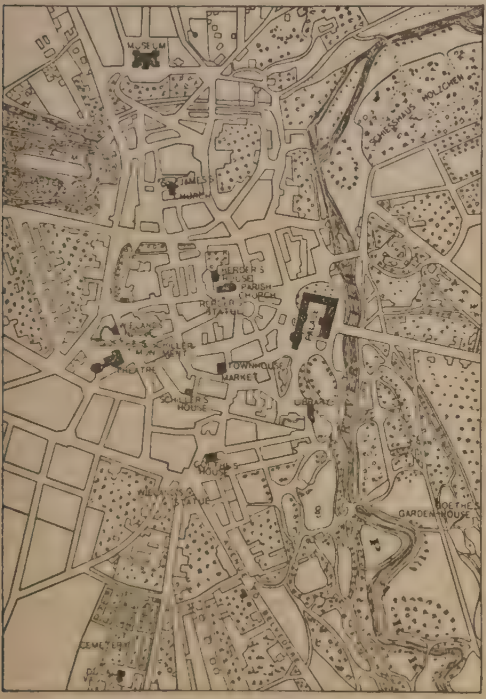
(W. M. F. P.)

WEIMAR, the capital of the grand-duchy of Saxe-Weimar-Eisenach, the largest of the Thuringian states, is situated in a pleasant valley on the Ilm, 50 miles southwest of Leipsic and 136 miles southwest of Berlin. Containing no very imposing edifices, and plainly and irregularly built, the town presents at first a somewhat unpretending and even dull appearance; but there is an air of elegance in its quiet and clean streets, which recalls the fact that it is the residence of a grand-duke and his court, and it still retains an indescribable atmosphere of refinement, dating from its golden age, when it won the titles of "poets' city" and "the German Athens." Weimar has now no actual importance, though it will always remain a literary Mecca. It is a peaceful little German town, abounding in excellent educational, literary, artistic, and benevolent institutions; its society is cultured, though perhaps a little narrow; while the even tenor of its existence is undisturbed by any great commercial or manufacturing activity. The population in 1885 was 21,565; in 1782, six years after Goethe's arrival, it was about 7000; and in 1834, two years after his death, it was 10,638.

The reign of Goethe's friend and patron, the grand-duke Charles Augustus (1775–1828), represents accurately enough the golden age of Weimar; though even during the duke's minority, his mother, the duchess Amalia, had begun to make the little court a focus of light and leading in Germany. The most striking building in Weimar is the extensive palace, erected for Charles Augustus under the superintendence of Goethe in 1789–1803, in place of one burned down in 1770. This building, with the associations of its erection, and its "poets' rooms," dedicated to Goethe, Schiller, Herder, and Wieland, epitomizes the characteristics of the town. The main interest of Weimar centres in these men and their more or less illustrious contemporaries; and, above all, Goethe, whose altar to the "genius hujus loci" still stands in the ducal park, is himself the genius of the place, just as Shakespeare is of Stratford-on-Avon, or Luther of Wittenberg. Goethe's residence from 1782 to 1832 (now opened as a "Goethe museum," with his collections and other reminiscences), the simple "garden-house" in the park, where he spent many summers, Schiller's humble abode, where he lived from 1802 till his death in 1805, and the grand-ducal burial vault, where the two poets rest side by side, are among the most frequented pilgrim resorts in Germany. Rietschel's bronze group of Goethe and Schiller (unveiled in 1857) stands appropriately in front of the theatre (much altered in 1868) which attained such distinction under their combined auspices. Not far off is the large and clumsy parish church, built about 1400, of which Herder became pastor in 1776; close to the church is his statue, and his house is still the parsonage. Within the church are the tombs of Herder and of Duke Bernard of Weimar, the hero of the Thirty Years' War. The altar-piece—a Crucifixion—is said to be the masterpiece of Lucas Cranach, whose house is pointed out in the market-place. Wieland, who came to Weimar in 1772 as the duke's tutor, is also commemorated by a statue, and his house is indicated by a tablet. Among the other prominent buildings in Weimar are the library, containing 200,000 volumes and a valuable collection of portraits, busts, and literary and other curiosities; the museum, built in 1863–68 in the Renaissance style; the ancient church of St. James, with the tombs of Lucas Cranach and Musæus; and the town-house, built in 1841. Various points in the environs of Weimar are also interesting from their associations. Separated from the town by the park, laid out in the so-called English style by Goethe, is the chateau of Belvedere, built in 1724. To the northeast is Tiefurt, often the scene of al-fresco plays, in which the courtiers were the actors and the rocks and trees the scenery; and to the northwest is the chateau of Ettersburg, another favorite resort of Charles Augustus and his court.



Plan of Weimar.

The history of Weimar, apart from its brilliant record at the end of the 18th and the beginning of the 19th century, is of comparatively little interest. The town is said to have existed in the 9th century and in the 10th to have belonged to a collateral branch of the family of the counts of Orlamünde. About 1376 it fell to the landgraves of Thuringia, and in 1440 it passed to the electors of Saxony. In 1806 it was visited by Napoleon, whose half-formed intention of abolishing the duchy was only averted by the tact and address of the duchess Luise. The muses have never left Weimar. Since 1860 it has been the seat of a good school of painting, represented by the landscape painters Preller, Kalckreuth and Max Schmidt, and the historical painters Pauwels, Heumann, and Verlat. The frequent residence here also of the Abbé Liszt, from 1848 till his death in 1886, has preserved for Weimar quite an important place in the musical world.

WEISSENFELS, an industrial town in the province of Saxony, Prussia, is situated on the Saale, 18½ miles southwest of Leipsic and 19 miles south of Halle. It contains three churches, a spacious market-place, and various educational and benevolent institutions. The former palace, called the Augustusburg, built in 1664–90, occupies a site on a sandstone eminence near the town; this spacious edifice is now used as a military school. Weissenfels manufactures machinery, sugar, pasteboard, paper, leather goods, pottery, and gold and silver wares. It contains also an iron-foundry, and carries on trade in timber and grain. In the neighborhood are large deposits of sandstone and lignite. Weissenfels is a place of considerable antiquity, and from 1657 till 1746 it was the capital of the dukes of Saxe-Weissenfels, a branch of the electoral house of Saxony. The body of Gustavus Adolphus was embalmed at Weissenfels after the battle of Lützen.[1] The population of the town in 1885 was 21,766.

WEKA, or **WEEKA**. See OCYDROME.

WELLESLEY, RICHARD WESLEY (or **WELLESLEY**), **MARQUIS OF** (1760–1842), eldest son of the first earl of Mornington, an Irish peer, and eldest brother of the duke of Wellington, was born June 20, 1760. He was sent to Eton, where he was distinguished as an excellent classical scholar, and to Christ Church, Oxford. By his father's death in 1781 he became earl of Mornington, taking his seat in the Irish House of Peers. In 1784 he entered the English House of Commons as member for Beeralston. Soon afterwards he was appointed a lord of the treasury by Pitt, with whom he rapidly grew in favor. In 1793 he became a member of the board of control over Indian affairs; and, although he was best known to the public by his speeches in defence of Pitt's foreign policy, he was now gaining the acquaintance with Oriental affairs which made his rule over India so wonderfully effective from the moment when, in 1797, he accepted the office of governor-general. Wellesley seems in a peculiar manner to have caught Pitt's own large political spirit during the years of his intercourse with him from 1793 to 1797. With equally profound conviction of the antagonism between the French republic and the interests of Great Britain all over the world, he had gained the same habit of dealing with political affairs in vast combinations and on the broadest survey. That Pitt and Wellesley had consciously formed the design of acquiring a great empire in India to compensate for the loss of the American colonies has not been proved; but the rivalry with France, which in Europe placed England at the head of coalition after coalition against the French republic and empire, made Wellesley's rule in India an epoch of enormous and rapid extension of English power. On the journey outwards he formed, after a discussion at the Cape with officials and soldiers returning home, the design of annihilating French influence in the Deccan. Soon after his landing, in April, 1798, he learnt that an alliance had actually been formed between Tippoo Saib and the French republic. Wellesley resolved to anticipate the action of the enemy, and ordered preparations for war. The invasion of Mysore followed in February, 1799, and the campaign was brought to a rapid close by the capture of Seringapatam (see INDIA and WELLINGTON). In 1803 the restoration of the peshwa was taken in hand, which proved the prelude to the great Mahratta war against Sindhia and the raja of Berar. The result of these wars and of the treaties which followed them was that French influence in India was extinguished, that forty millions of population and ten millions of revenue were added to the British dominions, and that the powers of the Mahratta and all other princes were so reduced that England became the really dominant authority over all India. Nor was Wellesley's rule distinguished only by conquest. He was an excellent administrator, and sought to provide, by the foundation of the college of Fort William, for the training of a class of men adequate to the great work of governing India. In connection with this college he established the governor-general's office, to which civilians who had shown great talent at the college were transferred, in order that they might learn something of the highest statesmanship in the immediate service of their chief. A free-trader, like Pitt, he endeavored to remove some of the restrictions on the trade between England and India. Both the commercial policy of Wellesley and his educational projects brought him into hostility with the court of directors, and he more than once tendered his resignation, which, however, public necessities led him to postpone till the autumn of 1805. He reached England just in time to see Pitt before his death. On the fall of the coalition ministry in 1807 Wellesley (an English peer from 1797 and marquis in the peerage of Ireland from 1799) was invited by George III. to join the duke of Portland's cabinet, but he declined, pending the discussion in parliament of certain charges brought against him in respect of his Indian administration. Resolutions condemning him for the abuse of power were moved both in the Lords and Commons, but defeated by large majorities. In 1809 Wellesley was appointed ambassador to Spain. He landed at Cadiz just after the battle of Talavera, and endeavored, but without success, to bring the Spanish Government into effective co-operation with his brother, who, through the failure of his allies, was compelled to retreat into Portugal. A few months later, after the duel between Canning and Castlereagh and the resignation of both, Wellesley accepted the post of foreign secretary in Perceval's cabinet. He held this office until February, 1812, when he retired, partly from dissatisfaction at the inadequate support given to Wellington by the ministry, but also because he had become convinced that the question of Catholic emancipation could no longer be kept in the background. From early life Wellesley had, unlike his brother, been an advocate of Catholic emancipation, and with the claim of the Irish Catholics to justice he henceforward identified himself. On Perceval's assassination he refused to join Lord Liverpool's administration, and he remained out of office till 1821, criticising with severity the proceedings of the congress of Vienna and the European settlement of 1814, which, while it reduced France to its ancient limits, left to the other great powers the territory that they had acquired by the partition of Poland and the destruction of Venice. He was one of the peers who signed the protest against the enactment of the Corn Laws in 1815. In 1821 he was appointed to the lord-lieutenancy of Ireland. Catholic emancipation had now become an open question in the cabinet, and Wellesley's acceptance of the viceroyalty was believed in Ireland to herald the immediate settlement of the Catholic claims. The Orange faction were incensed by the firmness with which their excesses were now repressed, and Wellesley was on one occasion mobbed and insulted. But the hopes of the Catholics still remained unfulfilled. Lord Liverpool died without having grappled with the problem. Canning in turn passed away; and on the assumption of office by Wellington, who was opposed to Catholic emancipation, his brother resigned the lord-lieutenancy. He had, however, the satisfaction of seeing the Catholic claims settled in the next year by the very statesmen who had declared against them. In 1833 he resumed the office of lord-lieutenant under Earl Grey, but the ministry fell a few months later, and, with one short exception, Wellesley did not further take part in official life. His old age, which was vigorous and animated to the last, was occupied with literary and classical pursuits. He died on September 26, 1842. He had no successor in the marquisate, but the earldom of Mornington and minor honors devolved on his brother William, Lord Maryborough, on the failure of whose issue in 1863 they fell to the second duke of Wellington.

---

[1] [And there it remained until removed in 1832 to Stockholm.—AM. ED.]

WELLINGBOROUGH, a market-town of Northamptonshire, England, is situated on the declivity of a hill near the junction of the Ise with the Nen, and on the London and Northwestern and Midland railway lines, 63½ miles north-northwest of London, and 10½ east-northeast of Northampton. The church of St. Luke contains some Norman and Early English portions, with later work of various periods, and a Decorated western tower and spire. The grammar-schools founded in 1594 and endowed with the revenues of a suppressed guild, include a school of the second and a school of the third grade, the former a building of red brick in the Renaissance style erected in 1880 at a cost of £6000 [$29,160], and the latter an old Elizabethan structure. Another educational endowment is Freeman's school, founded by John Freeman in 1711. There are also several charities. The market-place, situated in the centre of the town, was founded in 1874. The principal public buildings include the corn exchange (erected in 1861 at a cost of £4000 [$19,440], and the "Priory," an old residence now used for Sunday school and other parochial purposes. Formerly the town was famed for the chalybeate springs to which it owes its name. It is now of some importance as a centre of agricultural trade; but the staple industry is leather. A great impulse to the prosperity of the town was given by the introduction of the boot and shoe trade, especially the manufacture of uppers. Smelting, brewing, and iron-founding are also carried on, as well as the manufacture of portable steam-engines. A coal depôt of the Midland Railway is also situated in the town. The population of the township and urban sanitary district (area 3992 acres) in 1871 was 9385 and in 1881 it was 13,794.

In 948 Edred gave the church at Wellingborough to Croyland abbey, and the grant was confirmed by King Edgar in 966. In the reign of Edward II. the abbot was lord in full. It received the grant of a market in the 2d year of King

John. In 1621 it was visited by Charles I. and his queen, who resided in tents during a whole season that they might drink the waters. If was after its almost total destruction by fire in 1738 that the town was built on its present site on the hill.

WELLINGTON, a town of Shropshire, England, on the Great Western and London and Northwestern railway lines, and on the Shropshire Union Canal, 151¼ miles northwest of London, 11 east of Shrewsbury, and 31 northwest of Birmingham. The neighborhood is picturesque, the Wrekin, about 1½ miles from the town, rising to a height of 1320 feet. The church of All Saints, built in 1790, was restored in 1876, and again in 1883. There are a number of charities. The manufacture of agricultural implements, iron and brass founding, and malting are carried on. The population of the urban sanitary district (area 352 acres) in 1871 was 5926, and in 1881 it was 6217.

Wellington, which is situated near the old Roman Watling Street, is referred to in Domesday as held by Earl Roger. It was granted by King John to Thomas de Erdinton for services rendered at Rome at the time of the interdict. It was held by Earl Edwin, but by the rebellion of Robert de Belesme was forfeited to the king. The church of Wellington was given by Earl Roger to Shrewsbury abbey. Wellington was the first rendezvous of Charles I., who on 19th September, 1642, mustered his forces near the town.

WELLINGTON, a market-town of Somerset, England, is situated on a gentle elevation at the foot of the Blackdowns near the river Tone, and on the Great Western Railway, 170 miles south-southwest of London, and 7 southwest of Taunton. The church of St. John, a handsome structure, with one of the characteristic Somersetshire towers, is of the Perpendicular style of architecture, except the nave, which is Early English. The church contains a monument to Sir J. Popham, lord justice of England in the time of Elizabeth and James I. Among other public buildings are the market-house or town-hall (1833), the West Somerset county school (1880), and the Popham hospital for aged men and women, founded by Sir John Popham in 1606 and rebuilt in 1833. On the highest summit of the Blackdowns, 2½ miles south of the town, is a triangular stone tower erected in honor of the duke of Wellington, who took his title from the town. The staple industry is the woollen manufacture; iron-founding and brick and tile making are also carried on. The population of the township and urban sanitary district (area 5195 acres) in 1871 was 6286, and in 1881 it was 6360.

King Alfred gave Wellington, with other two neighboring manors, to Asser, who was afterwards raised to the see of Sherborne, and died in 883. Subsequently it was conferred on Aldhelm, the first bishop of Wells. In Domesday it occurs as Wallintone, and is valued at £25 [$121.50]. In the 2d of Edward VI. the manor was granted by Bishop Barlow, together with the borough of Wellington, to Edward, duke of Somerset. On the duke's attainder it came to the crown, with whom it remained till the 22d of James I.

WELLINGTON, the chief town of Hutt county, New Zealand, and the seat of the colonial Government, is situated in the southwest of North Island, on the shores of Port Nicholson, in 41° 16′ 25″ S. lat. and 174° 47′ 25″ E. long., 80 miles east of Nelson, 160 south of New Plymouth, and 1200 southeast of Sydney. The immediate surroundings of Wellington were originally very uninviting, as it is walled in by high ranges unsuitable for tillage, but great enterprise has been shown in the construction of roads to the more fertile regions. Railways are being gradually extended towards both the north and the northeast. Owing to the prevalence of earthquakes the city is built chiefly of wood, but within recent years there has been an increasing tendency to make use of concrete and brick. Among the principal public buildings are the Government house, the houses of legislature, the Government buildings, the new postal and telegraph office, Wellington college, St. Patrick's Catholic college, the odd fellows' hall, the freemasons' hall, the hospital, and the lunatic asylum. The city also possesses a colonial museum, an athenæum and mechanics' institute, a lyceum, and three theatres. The botanical gardens have an area of 100 acres. There is also a public park called the Town Belt. To supplement the water supply from two large reservoirs at Polhill's Gully, an aqueduct has lately been constructed from the Wainuiomata river, 16 miles distant, at an expense of £130,000 [$631,800].

Wellington was the first settlement of the New Zealand colonists. It owes its commercial prosperity and its selection as the capital to its convenient and central position. It is the seat of both a Protestant and a Catholic see. The harbor, which has lately been extended and improved, is one of the best and safest in New Zealand. There is a light-house at the eastern entrance, on Pincarrow Head, opposite which is the pilot station. There are two large wharves, and in Evans Bay there is a patent slip capable of receiving vessels of 2000 tons. As a shipping port Wellington ranks next to Auckland and Lyttelton. It possesses foundries, shipbuilding yards, boot factories, soap and candle works, tanneries, woollen, coffee, flour, and saw mills, breweries, aerated water works, coach factories, brick and tile works, and a very extensive meat-preserving establishment, which exports large supplies to Europe. The area of the municipal borough is 1100 acres and from 4176 in 1861 the population increased to 13,488 in 1871 and 20,563 in 1881, while in 1886 the city and suburbs had 27,833 inhabitants.

Indian service.

WELLINGTON, ARTHUR WELLESLEY, DUKE OF (1769–1852), was the fourth son of Garrett, earl of Mornington, now remembered only as a musician. He was descended from the family of Colley or Cowley, which had been settled in Ireland for some centuries. The duke's grandfather assumed the name of Wesley, on succeeding to the estates of Mr. Garrett Wesley, a kinsman of the famous divine; the affinity between the families of Colley and Wesley rests, however, on nothing nearer than a common ancestor in the 15th century. In the duke's early letters the family name is spelt Wesley; the change to Wellesley seems to have been made about 1790. Arthur (born in Ireland in the spring of 1769[1]) was sent to Eton, and subsequently to the military college at Angers. He entered the army as ensign of the 73d regiment in 1787, passed rapidly through the subaltern grades, became major of the 33d, and purchased the lieutenant-colonelcy of that regiment in 1793 with money advanced to him by his eldest brother. Before reaching full age he was returned to the Irish parliament by the family borough of Trim. Little is known of his history during these years; but neither in boyhood nor early youth does he appear to have made any mark among his contemporaries. His first experience of active service was in the disastrous campaign of 1794–95, when the British force under the duke of York was driven out of Holland by Pichegru. In 1796 he was sent with his regiment to India. Three years more passed before Wellesley became known to the world, but we have his own testimony that it was during these years of obscurity that he qualified himself in one direction for the great military career before him. As colonel commanding a regiment he gained the most minute and accurate acquaintance with every detail of the soldier's life, learned the precise amount of food required for every mouth, the exact weight that could be carried, the distances that could be traversed without exhaustion, the whole body of conditions, in short, which govern the activity both in peace and war of man and beast. It was to this absolutely complete knowledge of practical details that Wellington ascribed in great part his own success in the highest commands. It is probable, moreover, that he at this time made a serious study of the science and history of warfare. His training at the college of Angers is not sufficient to account for his great technical knowledge; no record, however, exists of the stages by which this was acquired. In 1798 Colonel Wellesley's eldest brother, Lord Mornington, afterwards marquis of Wellesley, arrived in India as governor-general. The war with Tippoo Saib followed. The 33d regiment was attached to the subsidiary force furnished by the nizam, and Colonel Wellesley was entrusted with the command of this division, under the orders of General Harris. In a preliminary attack upon the works of Seringapatam Wellesley met with a repulse; in the successful assault upon the town he commanded the reserve. Though his military services in this short campaign were not of a striking character, he was appointed by his brother to the supreme military and political command in Mysore. His great faculties now for the first time found opportunity for their exercise. In the settlement and administration of the conquered territory Wellesley rapidly acquired the habits and experience of a statesman. Nor, in the midst of his work of peaceful reorganization, was it possible for him to abandon the life of the soldier. The frontiers of Mysore were harassed by independent chieftains or marauders, especially by one Doondiah, an energetic leader, who had assumed the title of "the king of two worlds." Wellesley's operations against Doondiah were conducted with extraordinary energy; his marches in pursuit were prodigious, and his final success complete. More important, however, than the military side of these operations was their political character. When pressed in Mysore, Doondiah moved into Mahratta territory, and into this territory it was necessary for Wellesley to follow him. Here, negotiating and bargaining with the Mahratta chiefs, Wellesley acquired a knowledge of their affairs and an influence over them such as no other Englishman possessed. Simple and honorable himself, he was shrewd and penetrating in his judgment of Orientals; and, unlike his great predecessor Clive, he rigidly adhered to the rule of good faith in his own actions, however depraved and however exasperating the conduct of those with whom he had to deal. The result of Wellesley's singular personal ascendency among the Mahrattas came into full view when the Mahratta war broke out. In the meantime, however, his Indian career seemed likely to be sacrificed to the calls of warfare in another quarter. Wellesley was ordered by the governor-general, in December, 1800, to take command of a body of troops collected for foreign service at Trincomalee, in Ceylon. It was at first intended that these troops should act against Java or Mauritius; their destination was, however, altered to Egypt, and a notification was made to Wellesley that in consequence of this change General Baird would be placed in command above him. Though deeply offended at the loss of the command, Wellesley so completely sank all personal grievance in his devotion to the public cause that, in opposition to his instructions, and at the risk of incurring severe censure, he moved the troops on his own responsibility from Trincomalee to Bombay, from the conviction that, if they were to be of any use in Egypt, it was absolutely necessary that they should provision at Bombay without delay. The documents in which Wellesley justified this step prove his singularly clear and profound acquaintance with the conditions of a successful invasion of Egypt from India. At Bombay Wellesley was attacked by fever, and prevented from going on to Egypt. He returned with great satisfaction to his government in Mysore, where he remained until the Mahratta war broke out. The power of the peshwa, nominally supreme in the Mahratta territory, had been overthrown by his rivals Holkar and others, and he had himself fled from Poona to Bassein on the coast. By the treaty of Bassein, made in December, 1802, the Indian Government entered into an alliance with this potentate, and pledged itself to restore his authority. Wellesley was placed in command of the army charged with this task. Starting from Seringapatam, he crossed the frontier on March 12, 1803, and moved through the southern Mahratta territory on Poona. The march was one unbroken success. Wellesley's own arrangements, which displayed the utmost forethought and sagacity in dealing with the physical conditions to be encountered on the march, would no doubt have secured his victory had resistance been encountered; but his personal and diplomatic ascendency among the chieftains of the district worked even more powerfully than the fear of his arms. No hand was raised against him, and a march of six hundred miles was conducted without even a skirmish. "The confidence and respect of every class in the provinces south of the Kistna," wrote Major Malcolm, the political agent who accompanied the march "is in a very great degree personal to Major-General Wellesley. To the admiration which the Mahratta chiefs entertain for that officer's military character, and the firm reliance which the inhabitants place on his justice and protection, the extraordinary success which has hitherto attended the progress of the march must be principally attributed." Wellesley had intended to reach Poona on the 23d of April. On the night of the 18th, when 60 miles distance from Poona he received intelligence that Amrut Rao, a rival of the peshwa's, intended to burn the city at the approach of the English. Counting no moment to be lost, Wellesley pressed on with the cavalry, accomplished the march of 60 miles in thirty-two hours, and entered Poona on the afternoon of the 20th, in time to save the city from destruction. The peshwa was now restored to power, and entered into various military obligations with Wellesley, which he very imperfectly fulfilled.

---

[1] In Merrion Street, Dublin, or at Dungan Castle, Meath, towards the end of April or on 1st May; but both place and date are uncertain.

Mahratta war.

In the meantime Sindhia and Holkar, with the raja of Berar, maintained a doubtful but threatening aspect farther north. It was uncertain whether or not a confederacy of the northern Mahrattas had been formed against the British Government. In these critical circumstances, while peace and war hung in the balance, Wellesley was charged with "the general direction and control of all the military and political affairs of the British Government in the territories of the nizam, of the peshwa, and of the Mahratta states and chiefs." Acting in execution of these powers, he required Sindhia, as a proof of good faith, to withdraw to the north of the Nerbudda. Sindhia not doing so, war was declared on August 6, 1803. Wellesley marched northwards, captured Ahmadnagar on August 11, crossed the Godavery ten days later, and moved against the combined forces of Sindhia and the rajah of Berar. Colonel Stevenson was meanwhile approaching with a second division from the east, and it was intended that the two corps should unite in an attack on the enemy. On the 23d of September Wellesley supposed himself to be still some miles from the Mahratta headquarters; he suddenly found that the entire forces of Sindhia and the rajah of Berar were close in front of him at Assaye. Weighing the dangers of delay, of retreat, and of an attack with his own unsupported division, Wellesley convinced himself that an immediate attack, though against greatly superior forces in a strong position, was the wisest course. He threw himself upon the Mahratta host, and ultimately gained a complete victory, though with the loss of 2500 men out of a total probably not much exceeding 7000. In comparison with the battle of Assaye, all fighting that had hitherto taken place in India was child's play. The enemy's artillery was of the most formidable character, and worked with deadly effect. A hundred cannon were taken by the conqueror, who now, uniting with Stevenson's division, followed up the pursuit, and brought the war to a close by a second victory at Argaum on November 29. The treaties with Sindhia and the raja of Berar which followed the overthrow of their arms, and which marked the downfall of the Mahratta power, were negotiated and signed by Wellesley in the course of the following month. Not yet thirty-five years old, Wellesley had proved himself as thorough a master in the sphere of Indian statesmanship and diplomacy as on the field of battle. Had his career ended at this time, his despatches on the negotiations with the Mahrattas and on the general conduct of Indian policy would have proved him to have been one of the wisest and strongest heads that have ever served England in the East.

Service in the Peninsula.

In the spring of 1805 Wellesley, now Sir Arthur, quitted India and returned home. He was immediately sent on the expedition to Hanover which was rendered abortive by the battle of Austerlitz. In 1806 he was elected member of parliament for the borough of Rye, and in the following year was appointed Irish secretary. After serving in this office for a few months he was employed in the expedition against Copenhagen, where little glory was to be gained. In the summer of 1808 he took command of a body of troops destined to operate against the French in Spain or Portugal. Finding that the junta of Corunna wished for no foreign soldiery, he proceeded to fulfil his instructions by acting against Junot at Lisbon. He landed at Mondego Bay in the first week of August, and moved southwards, driving in the enemy's posts at Roliça on August 17. On the 21st the battle of Vimiero was fought and won. In the midst of this engagement, however, Sir Harry Burrard landed, and superseded Wellesley in the command. Wellesley in vain called upon this general to follow up the pursuit when the victory was gained. The consequence was that Junot's army, which would have been captured or annihilated if Wellesley's advice had been executed, escaped into a position which secured it the means of retreat if favorable terms of capitulation were refused. The convention of Cintra provided for the evacuation of Portugal by the French, but it gave Junot and all his troops a free return to France. So great was the public displeasure in England at the escape of the enemy that a court of inquiry was held into all the circumstances attending the convention of Cintra. At this inquiry the rejection of Wellesley's counsels by his superior officer at the close of the battle of Vimiero was fully proved.

Battle of Talavera.

After the failure of Sir John Moore's campaign in the winter of 1808–9, Wellesley, who had in the meantime resumed his duties as Irish secretary, returned to the Peninsula as chief in command. His first move was against Soult, who had captured Oporto. He drove the French out of this city by a singularly bold and fortunate attack, and then prepared to march against Madrid by the valley of the Tagus. Some appearance of additional strength was given him by the support of a Spanish army under General Cuesta; but his movements were delayed by the neglect and bad faith of the Spanish Government, and time was given to Soult to collect a large force at Salamanca, with which he intended to fall upon the English line of communications. Wellesley, unconscious of Soult's presence in force on his flank, advanced against Madrid, and finally drew up at Talavera to meet the attack of Victor, who had defeated Cuesta and driven him back on the English. The battle was begun on the 27th and continued on the 28th of July. Wellesley gained a complete victory, and decisively proved the superiority of English troops under his command over those of the enemy. But within the next few days Soult's approach on the line of communication was discovered. It was impossible for Wellesley to follow up his advantages. The victory of Talavera had brought prestige but nothing else. Superiority of numbers had made the French the real winners of the campaign, and Wellesley, disgusted with his Spanish allies, had no choice but to withdraw into Portugal and there stand upon the defensive. A peerage, with the title of Viscount Wellington, was conferred upon him for his victory at Talavera.

Lines of Torres Vedras.

Up to this time Napoleon, with the bulk of his armies, had been occupied with the war against Austria. The peace of Vienna, concluded in October, 1809, made him free to throw an almost unlimited force into the Spanish Peninsula. Wellington, foreseeing that Portugal would now be invaded by a very powerful army, began the fortification of the celebrated lines of Torres Vedras, which followed the mountain-bastion on the north of Lisbon, and left no single point open between the Tagus and the sea. The English army in the meantime wintered in the neighborhood of Almeida. As summer approached Wellington's anticipations were realized. Masséna, who had distinguished himself above every other general in the Austrian war of 1809, arrived in Spain, and moved against Portugal with an army of 70,000 men. Wellington was unable to prevent Ciudad Rodrigo from falling into the hands of the French. He retreated down the valley of the Mondego, devastating the country, and at length halted at Busaco, and gave battle. The French attack was repelled, but other roads were open to the invader, and Wellington continued his retreat. Masséna followed, and heard for the first time of the fortifications of Torres Vedras when he was within five days' march of them. On approaching the mountain-barrier the French general sought in vain for an unprotected point. It was with the utmost difficulty, while waiting for reinforcements, that he could keep his army from starving. At length, when the country was utterly exhausted, he commenced his retreat. Wellington descended from the heights, but his marching-force was too weak to risk a pitched battle. Masséna was in consequence able to maintain himself at Santarem for the winter. But in the spring of 1811 Wellington received reinforcements from England. He now moved against the enemy. Masséna retreated northwards, devastating the country with unsparing severity in order to check the pursuit. Such were the sufferings of his army, both in the invasion and in the retreat, that, although only one battle was fought during the campaign, the French, when they re-entered Spain, had lost 30,000 men.

In the meantime Soult, who was besieging Cadiz, had received orders from Napoleon to move to the support of Masséna. Leaving part of his force in front of Cadiz, he marched northwards and captured Badajoz. Here, however, he learnt that Masséna was in full retreat, and also that his own army besieging Cadiz had been attacked and beaten. He in consequence returned and resumed the blockade. Wellington, freed from pressure on the south, and believing Masséna to be thoroughly disabled, considered that the time had come for an advance into Spain. The fortresses of Almeida, Ciudad Rodrigo, and Badajoz had to be recaptured from the French. Leaving a small force to besiege Almeida, Wellington went southwards to arrange with Beresford for the siege of Badajoz. During his absence Masséna again took the field, and marched to the relief of Almeida. Wellington returned in time to defeat him at Fuentes d'Onoro, and Almeida passed into the hands of the British. In the south Soult advanced to the relief of Badajoz. He was overthrown by Beresford at Albuera; but the junction of the two French armies compelled the English to raise the siege, and Wellington had to retire within the Portuguese frontier. Moving northwards with the view of laying siege to Ciudad Rodrigo, he was again outnumbered by the French and forced to withdraw to cantonments on the Coa.

Wellington had from the first seen that, whatever number of men Napoleon might send against Portugal it was impossible, owing to the poverty of the country, Badajoz captured.

that any great mass of troops could long be held together. The French generals, by combining their armies, might for a while be superior to him, but the want of provisions would inevitably lead to their separation after a longer or shorter interval. This was verified at the end of 1811. Soult's division had to move southward for support, and the English were again more than a match for the enemy in front of them. Wellington resumed the offensive, and on the 19th of January, 1812, Ciudad Rodrigo was taken by storm. The road into Spain was now open; it only remained to secure Portugal itself and the line of communication by the capture of Badajoz. Wellington crossed the Tagus and completed the investment of this fortress by the middle of March. It was necessary at whatever cost to anticipate the arrival of Soult with a relieving army, and on the 6th of April Wellington ordered the assault. The fearful slaughter which took place before the British were masters of the defences caused Wellington to be charged with indifference to the loss of human life; but, whatever faults may have been made in the actual operations, a postponement of the attack would merely have resulted in more battles against Soult, in which a greater number of men would have perished. Of all generals Wellington was the last to throw away a single life needlessly.

Advance into Spain.

Battle of Salamanca.

The advance into Spain against the French line of communication between Madrid and the Pyrenees was now begun. Marmont, who had succeeded Masséna in the command, fell back and allowed Wellington to occupy Salamanca; but on reaching the Douro he turned upon his assailant, and, by superior swiftness in marching, threatened to cut the English off from Portugal. Wellington now retreated as far as Salamanca, and there extricated himself from his peril by one of the most brilliant victories which he ever gained (July 22). The French fell back on Burgos. Instead of immediately following them, which from a military point of view would have been the better course, Wellington thought it wise to advance upon the Spanish capital. King Joseph retired southwards and the English entered Madrid in triumph. The political effect of this act was very great, but the delay gave the French northern army time to rally. On marching against them Wellington was checked by the obstinate defence of Burgos. Moreover, in consequence of the loss of the capital, Soult was now ordered to raise the siege of Cadiz, and to move to the support of King Joseph. Gathering his forces, and uniting them with the French army of the centre, he pressed on towards Madrid. It was impossible for Wellington to maintain his position, and he was compelled once more to retire into Portugal, while Madrid passed back into the hands of the French. During this, his last retreat, the demoralization and misconduct of the British army surpassed anything that their chief had ever witnessed. The effect of the campaign was, however, that Cadiz was free, and that the southern provinces were finally cleared of the invader.

Battle of Vitoria.

Return to England.

Wellington was now invested by the cortes with the supreme command of the Spanish armies. He visited Cadiz in December, 1812, and offered counsels of moderation to the democratic assembly, which were not followed. During the succeeding months he was occupied with plans and preparations for a great combined attack, and at length, in May, 1813, the hour for his final and victorious advance arrived. The disasters of the Russian campaign had compelled Napoleon to withdraw some of his best regiments from the Peninsula. Against a weakened and discouraged adversary Wellington took the field with greatly increased numbers, and with the utmost confidence of victory. His design was to throw himself directly upon the French line of communication, keeping his left pushed forward in advance of his centre, so as to threaten the envelopment of the fortified posts held by the enemy. Napoleon had foreseen that this would be the strategy of the English commander, and had ordered King Joseph to neglect every point to the centre and east, and to concentrate at Valladolid. This order had been but imperfectly obeyed. The advance of the allied army was irresistible. Position after position was evacuated by the French, until Wellington, driving everything before him, came up with the retreating enemy at Vitoria, now encumbered with an enormous train of fugitives, and with the spoils of five years' occupation of Spain. His victory, won on the 21st of June, was overwhelming. All the artillery and almost all the treasure and stores of the French army fell into the hands of the conquerors. It only remained for Napoleon to commit to Marshal Soult, as his lieutenant, the task of defending the Pyrenees, and of delivering, if possible, the fortresses of St. Sebastian and Pamplona, which Wellington now besieged. Soult's combats in the Pyrenees, and the desperate resistance of St. Sebastian, prolonged the struggle through the autumn of 1813, and cost the English torrents of blood. But at length the frontier was passed, and after a succession of encounters on French soil Soult was forced back into his entrenched camp at Bayonne. Both armies now rested for some weeks, during which interval Wellington gained the confidence of the inhabitants of the district by his unsparing repression of marauding, his business-like payment for supplies, and the excellent discipline which he maintained among his soldiers. In February, 1814, the advance was renewed. The Adour was crossed, and Soult, leaving a garrison in Bayonne, fell back on Orthes. At Orthes he was attacked and defeated. Bordeaux now declared in favor of the Bourbons and admitted the English. Soult's last move was upon Toulouse. Here, after the allies had entered Paris, but before the abdication of Napoleon had become known, the last battle of the war was fought. Peace being proclaimed, Wellington took leave of his army at Bordeaux, and returned to England, where he was received with extraordinary honors.

Ambassador at Paris.

The Hundred Days.

After the treaty of Paris (May 30) Wellington was appointed British ambassador at the French capital. During the autumn and winter of 1814 he witnessed and reported the mistakes of the restored Bourbon dynasty, and warned his Government of the growing danger from conspiracies and from the army, which was visibly hostile to the Bourbons. "The truth is," he wrote, "that the king of France without the army is no king." His insight, however, did not extend beyond the circumstances immediately before and around him, and he entirely failed to apprehend the fact that the great mass of the French nation was still with Napoleon at heart. He remained in France until February, 1815, when, in consequence of the return of Lord Castlereagh to England to meet the House of Commons, he took that minister's place at the congress of Vienna. All the great questions of the congress had already been settled, and Wellington's diplomatic work here was not of importance. His imperfect acquaintance with French feeling was strikingly proved in the despatch which he sent home on learning of Napoleon's escape from Elba. "He has acted," he wrote, "upon false or no information, and the king (Louis XVIII.) will destroy him without difficulty and in a short time." Almost before Wellington's unfortunate prediction could reach London, Louis had fled beyond the frontier, and France was at Napoleon's feet. The ban of the congress, however, went out against the common enemy of mankind, and the presence of Wellington at Vienna enabled the allies at once to decide upon their plans for the campaign. To Wellington and Blücher was committed the invasion of France from the north, while the Russians and

Austrians entered it from the east. Preparations were pushed forward, and it was supposed that the war would be opened by an attack upon Alsace about the middle of June. Wellington, with 35,000 English troops and about 60,000 Dutch, Germans, and Belgians, took his post in the Netherlands, guarding the country west of the Charleroi road. Blücher, with 120,000 Prussians, lay between Charleroi, Namur, and Liége. In the meantime Napoleon had outstripped the preparations of his adversaries, and by the 13th of June had concentrated 130,000 men on the northern frontier about Philippeville. It now became known to the allied leaders that large French forces were near at hand, but Wellington believed that Napoleon himself was still in Paris, and still expected that the war would be opened by a forward movement of Schwarzenberg into Alsace. He was, moreover, strongly of opinion that, if Napoleon did take up the offensive on the north, he would throw himself upon the west of the English line and endeavor to cut the English off from the sea. Persuaded that the danger lay rather towards the coast than at the centre of the Anglo-Prussian line, he kept his forces farther westward than he would have done if he had known Napoleon's real intentions. Although the French advance on the centre became evident at the front on the morning of the 14th, it was unknown to Wellington till the afternoon of the 15th (after the Prussians had been driven out of Charleroi) that the French had made any movement whatever. How it was that the advance remained unknown to Wellington for twenty-four hours has not been explained; had he learnt of it at once, he would probably have been able to reach Ligny with sufficient force to turn the Prussian defeat into a victory and to end the war at one blow. Commencing his concentration eastwards twenty-four hours too late, he was unable to fulfil his design of assisting Blücher. Ney, getting a start on the Brussels road, kept the English occupied at Quatre Bras during the 16th, while Napoleon was dealing with the Prussians at Ligny,—though the ultimate defeat of the French at Quatre Bras, and Napoleon's own failure to follow up his victory at Ligny by a rapid pursuit, rendered it possible for the allies to effect two days later the combination which they had failed to effect at Ligny.

Waterloo.

On the morning of Sunday, June 18th, Wellington, assured of Blücher's assistance, awaited Napoleon's attack on the memorable plain of Waterloo. How, at the head of 30,000 English and 40,000 mixed troops, he withstood the onslaught of the French army, and ultimately, in union with Blücher, swept them from the field, needs not to be recounted here.

Restoration of the Bourbons.

Conditions of peace.

Ending his military career with one of the greatest achievements in history, Wellington suddenly became, from the peculiar circumstances of the moment, the most influential politician in Europe. The czar and the emperor of Austria were still at Nancy when Paris surrendered. Wellington had reason to believe that Alexander bore so hostile a feeling towards Louis XVIII. that, if matters were not settled before the arrival of the czar at Paris, the Bourbon dynasty might not be restored at all. He therefore took affairs into his own hands, and concluded an arrangement whereby the regicide Fouché, at that moment the most powerful man in Paris, was accepted as the minister of Louis XVIII. The difficulties which might otherwise have been thrown in the way of this monarch's return to the Tuileries by the troops or by the populace of Paris were thus removed; and when Alexander arrived he found Louis XVIII. already in possession. The negotiation with Fouché was not a dignified episode in Wellington's life; he stooped, however, to a somewhat humiliating expedient in order to avert substantial mischief. The next manifestation of his personal ascendency was of a finer kind. The conditions of peace with France had to be determined by the allies; and, while the czar urged that France should be left with undiminished territory, Prussia demanded, as a guarantee against renewed aggression, the annexation of Alsace and Lorraine. The British cabinet at first inclined to the Prussian view. Wellington, however, argued strongly for the opposite policy. He urged that the Bourbon dynasty would be hopelessly discredited if its second restoration were accompanied by the loss of the border provinces; that the allies had in their proclamations distinguished between the cause of Napoleon and the cause of the French people; and that the French people, by refraining from offering any general resistance, had shown their practical acceptance of this distinction and so entitled themselves to the advantages held out in it. Wellington's arguments brought the English Government round to his own view, and so turned the balance in favor of the czar's policy of forbearance and against the annexations demanded by Prussia. The policy which he thus successfuly advocated has naturally been condemned by most German statesmen and historians; but its justification is to be found in the long continuance of the peace of 1815, a continuance which would hardly have been possible if the recovery of Alsace and Lorraine had been added to the other motives which, during the next thirty years, repeatedly brought France to the verge of war.

Congress of Verona.

Peace being concluded, Wellington was appointed commander-in-chief of the joint army of occupation, by which it was stipulated that France should be watched for the next five years. The administrative duties attaching to this post, and the reconstruction of the military frontier of the Netherlands, were, however, but a small part of the work now imposed upon him. In conjunction, and sometimes in rivalry, with the representatives of the other powers, he observed the course of French politics, counselling King Louis XVIII., checking to the best of his ability the extravagances of the count of Artois and the ultra-royalist party, and advancing the financial negotiation with Messrs. Baring which enabled the French Government to pay the indemnities due from it, and thus rendered it possible for the powers to reduce the period of occupation from five to three years. When this reduction was first proposed, Wellington had not been confident of its wisdom; he subsequently became convinced that it might be granted with safety, and at the congress of Aix-la-Chapelle in 1818 he supported the proposal for the immediate evacuation of France, though this cut short by two years his own tenure of an office of almost unparalleled influence and emolument. Returning to England, he sank into the comparative insignificance of master-general of the ordnance, with a seat in the cabinet. For the next three years he was little before the world; but in 1822, on the death of Castlereagh, he was sent in the place of this minister to represent Great Britain at the congress of Verona. The main question before the congress was the policy to be adopted with regard to the Spanish movement, whether called revolutionary or constitutional, by which the absolute monarchy of King Ferdinand had been overthrown. It was the settled policy of the British Government to oppose any joint intervention of the powers in Spain; it was not, however, known at London before Wellington set out that the project of intervention yet existed anywhere in a definite form. In passing through Paris the duke discovered the danger to be more imminent than had been supposed; he also learnt that, whatever might be the intentions of the French Government with regard to intervention in Spain by its own army, it was determined under no circumstances to give Russian troops a passage through France. No sooner had Wellington arrived at Verona than he found that the czar was bent upon obtaining a joint declaration of all the powers condemning the Spanish constitution, and committing to the Russian army, as the mandatory of Europe, the task of overthrowing it. In pursuance of his instructions, Wellington now stated that Great Britain would rather sever itself from the European alliance cemented at Aix-la-Chapelle than consent to any such joint declaration; and the information which he had privately acquired at Paris enabled him to inform the czar that his project of employing Russian troops in Spain would certainly be thwarted by France. Armed with these two powerful arguments—the one public and official, the other personal and private—Wellington had no great difficulty in preventing the summary framing of a decree against Spain like that which had been issued two years before by the congress of Troppau against the constitution of Naples. In this respect the British Government had gained its point; but its success was apparent rather than real. Although the congress of Verona published no declaration of joint European action against the Spanish constitution, it was not in Wellington's power to prevent the negotiations which followed between the French representative and the three Eastern courts. Out of these negotiations arose the French attack upon Spain in 1823, accompanied by diplomatic action on the part of the Eastern powers which rendered the restoration of Spanish absolutism more complete and more unqualified than it would have been if France had entered upon the work entirely alone.

In the cabinet of Lord Liverpool the influence of Canning had, since Castlereagh's death, been predominant on all matters of foreign policy. Though Wellington disliked the tone of defiance frequently used by Canning towards the autocratic courts, he was sincerely at one with Canning's Spanish policy; he did not oppose his recognition of the independence of the South American republics; and, when Canning, abandoning his position of passive neutrality between the Turkish government and insurgent Greece, proposed to attempt joint diplomatic action with Russia in hope of terminating the struggle, the duke was willing to co-operate in this policy within certain limits. Canning, while really anxious to assist the Greeks, based his new policy officially on the need of preventing Russia from acting alone. With the duke, the design of putting a check upon Russia was the sole active motive. He cared nothing whatever for the Greeks, but he did feel anxious to prevent Russia from making their cause a pretext of war with the Porte. He therefore consented, on the coronation of the czar Nicholas in 1826, to carry proposals to St. Petersburg for the diplomatic co-operation of Russia and England in bringing about a settlement of the Greek question. On the 4th of April, 1827, the protocol of St. Petersburg was signed, by which the two powers agreed that the mediation of England should be offered to the Porte, on terms that Greece should be granted local autonomy, but remain part of the Ottoman empire and tributary to the sultan. No provision was made for further action in case the Porte should not accept England's mediation on these terms, nor was employment of force even alluded to. Scarcely had this protocol been signed when the accession of Canning to the premiership caused Wellington to withdraw from the Government. He was willing to serve with Canning under a common leader, but would not serve under him. The effect of his withdrawal was momentous in its bearing upon Eastern affairs. Canning, freed from Wellington's restraint, carried his intervention on behalf of Greece a step further, and concluded on the 27th of July, the treaty of London, whereby France, England and Russia bound themselves to put an end to the conflict in the East and to enforce the conditions of the St. Petersburg protocol upon the belligerents. Against this treaty Wellington protested, on the ground that it "specified means of compulsion which were neither more nor less than measures of war." His apprehensions were fulfilled by the battle of Navarino.

Negotiations at St. Petersburg.

Canning died in August, 1827, and on the fall of Lord Goderich's cabinet five months later Wellington became prime minister. He had declared some time before that it would be an act of madness for him to take this post; but the sense of public duty led him to accept it when it was pressed upon him by the king. His cabinet included at the first Huskisson, Palmerston, and other followers of Canning. The repeal of the Test and Corporation Acts having been carried in the House of Commons in the session of 1828, Wellington to the great disappointment of Tories like Lord Eldon, recommended the House of Lords not to offer further resistance, and the measure was accordingly carried through. Soon afterwards a quarrel between the duke and Huskisson led to the retirement from the ministry of all its more liberal members. It was now hoped by the so-called Protestant party that Wellington, at the head of a more united cabinet, would offer a steady resistance to Catholic emancipation. Never were men more bitterly disappointed. The Clare election and the progress of the Catholic Association convinced both Wellington and Peel that the time had come when Catholic emancipation must be granted; and, submitting when further resistance would have led to civil war, the ministry itself brought in at the beginning of the session of 1829 a bill for the relief of the Catholics. Wellington, who had hitherto always opposed Catholic emancipation, explained and justified his change of front in simple and impressive language. His undoubted seriousness and his immense personal reputation did not however, save him from the excesses of calumny and misinterpretation; and in order to impose some moderation upon his aspersers the duke thought it necessary to send a challenge to one of the most violent of these, the earl of Winchelsea. No mischief resulted from the encounter.

Prime minister.

Catholic emancipation.

Catholic emancipation was the great act of Wellington's ministry; in other respects his tenure of office was not marked by much success. The imagination and the breadth of view necessary to a statesman of the highest order were not part of his endowment, nor had he the power of working harmoniously with his subordinates. His Eastern policy was singularly shortsighted. There might have been good reason, from Wellington's point of view, for condemning Canning's treaty of London; but when, in consequence of this treaty, the battle of Navarino had been fought, the Turkish fleet sunk, and the independence of Greece practically established, it was the weakest of all possible courses to withdraw England from its active intervention, and to leave to Russia the gains of a private and isolated war. This, however, was Wellington's policy; and, having permitted Russia to go to war alone in 1828, nothing remained for him but to treat Greece as a pawn in Russia's hands, and to cut down the territory of the Greek kingdom to the narrowest possible limits, as if the restoration to the sultan of an inaccessible mountain-tract, inhabited by the bitterest of his enemies, could permanently add to the strength of the Ottoman empire. The result was the renunciation of the Greek Crown by Prince Leopold; and, although, after the fall of Wellington's ministry, a somewhat better frontier was given to Greece, it was then too late to establish this kingdom in adequate strength, and to make it, as it might have been made, a counterpoise to Russia's influence in the Levant. Nor was the indulgence shown by the cabinet towards Dom Miguel and the absolutists of Portugal quite worthy of England. That Wellington actively assisted despotic Governments against the constitutional movements of the time is not true. He had indeed none of the sympathy with national causes which began to influence British policy under Canning, and which became so powerful under Palmerston; but the rule which he followed in foreign affairs, so far as he considered it possible, was that of non-intervention.

Eastern policy.

Agitation for reform.

Fall of Wellington ministry.

As soon as Catholic emancipation was carried, the demand for a reform of parliament agitated Great Britain from end to end. The duke was ill-informed as to the real spirit of the nation. He conceived the agitation for reform to be a purely fictitious one, worked up by partisans and men of disorder in their own interest, and expressing no real want on the part of the public at large. Met with a firm resistance, it would, he believed, vanish away, with no worse result than the possible plunder of a few houses by the city mobs. Thus wholly unaware of the strength of the forces which he was provoking, the duke, at the opening of the parliament which met after the death of George IV., declared against any parliamentary reform whatever. This declaration led to the immediate fall of his Government. Lord Grey, the chief of the new ministry, brought in the Reform Bill, which was resisted by Wellington as long as anything was to be gained by resistance. When the creation of new peers was known to be imminent, Wellington was among those who counselled the abandonment of a hopeless struggle. His opposition to reform made him for awhile unpopular. He was hooted by the mob on the anniversary of Waterloo, and considered it necessary to protect the windows of Apsley House with iron shutters.

Later life.

For the next two years the duke was in opposition. On the removal of Lord Althorp to the House of Lords in 1834, King William IV. unexpectedly dismissed the Whig ministry and requested Wellington to form a cabinet. The duke, however, recommended that Peel should be at the head of the Government, and served under him, during the few months that his ministry lasted, as foreign secretary. On Peel's later return to power in 1841 Wellington was again in the cabinet, but without departmental office beyond that of commander-in-chief. He supported Peel in his Corn-Law legislation, and throughout all this later period of his life, whether in office or in opposition, gained the admiration of discerning men, and excited the wonder of zealots, by his habitual subordination of party spirit and party connection to whatever appeared to him the real interest of the nation. On Peel's defeat in 1846, the duke retired from active public life. He was now nearly eighty. His organization of the military force in London against the Chartists in April, 1848, and his letter to Sir John Burgoyne on the defences of the country, proved that the old man had still something of his youth about him. But the general character of Wellington's last years was rather that of the old age of a great man idealized. To the unbroken splendors of his military career, to his honorable and conscientious labors as a parliamentary statesman, life unusually prolonged added an evening of impressive beauty and calm. The passions excited during the stormy epoch of the Reform Bill had long passed away. Venerated and beloved by the greatest and the lowliest, the old hero entered, as it were, into the immortality of his fame while still among his countrymen. Death came to him at last in its gentlest form. He passed away on the 14th of September, 1852, and was buried under the dome of St. Paul's, in a manner worthy both of the nation and of the man. His monument, a mere fraction of the work originally designed, stands in the chapel at the southwestern end of the cathedral.

Authorities.—The *Wellington Despatches*, edited by Gurwood; *Supplementary Despatches*; and *Wellington Despatches, New Series*, edited by the second duke of Wellington. Unlike Napoleon's despatches and correspondence, everything from Wellington's pen is absolutely trustworthy; not a word is written for effect, and no fact is misrepresented. Almost all the political memoirs of the period 1830–1850 contain more or less about Wellington in his later life. Those of Greville and Croker have perhaps most of interest. (C. A. F.)

WELLS, a municipal borough in the county of Somerset, England, at the foot of the Mendip Hills, 135 miles west of London. At present it is a place of little importance, except for its cathedral, markets and assizes. The population of the city (726 acres) in 1881 was 4634.

The city of Wells is said to have derived its name from some springs called St. Andrew's Wells, which during the Middle Ages were thought to have valuable curative properties. The municipality, consisting of a mayor, seven aldermen, and sixteen chief burgesses, was incorporated by a charter granted by King John in 1202. During Saxon times Wells was one of the most important towns of Wessex, and in 905 it was made the seat of a bishopric by King Edward the Elder. About the year 1091-1092 Bishop John de Villula removed the see to Bath; and for some years Wells ceased to be an episcopal city. After many struggles between the secular clergy of Wells and the regulars of Bath, it was finally arranged in 1139 that the bishop should take the title of "bishop of Bath and Wells," and should for the future be elected by delegates appointed partly by the monks of Bath and partly by the canons of Wells. The foundation attached to the cathedral church of Wells consisted of a college of secular canons of St. Augustine, governed by a dean, sub-dean, chancellor, and other officials.

The existing cathedral, one of the most magnificent of all the secular churches of England, was begun by Bishop Joceline soon after his election to the episcopate in 1220; and the greater part of the building was completed before his death in 1244. According to the usual mediæval practice, the eastern part of the church was begun first, and the choir was consecrated for use long before the completion of the nave, the western part of which, with the magnificent series of statues on the façade, was carried out during the second half of the 13th century, and probable finished about the year 1300. The upper half of the two western towers has never been built. The very noble and well-designed central tower, 160 feet high, was built early in the 14th century; the beautiful octagonal chapter-house on the north side, and the lady chapel at the extreme east, were the next important additions in the same century. The whole church is a building of very exceptional splendor and beauty; it is covered throughout with stone groining of various dates, from the Early English of the choir to the fan vaulting of the central tower. Its plan consists of a nave and aisles, with two short transepts, each with a western aisle and two eastern chapels. The choir and its aisles are of unusual length, and behind the high altar are two smaller transepts, beyond which is the very rich Decorated lady chapel, with an eastern semi-octagonal apse. The main tower is at the crossing. On the north of the choir is the octagonal chapter-house, the vaulting of which springs from a slender central shaft; as the church belonged to secular clergy, it was not necessary to place it in its usual position by the cloister. The cloister, 160 by 150 feet, extends along the whole southern wall of the nave. The extreme length of the church from east to west is 371 feet. The oak stalls and bishop's throne in the choir are magnificent examples of 15th century woodwork, still well preserved.

The great glory of the church, and that which makes it unique among the many splendid buildings of mediæval England, is the wonderful series of sculptured figures which decorate the exterior of the west front,—the work of English sculptors of the latter part of the 13th century,—a series which shows that at that time England was, as far as the plastic art is concerned, in no degree inferior to Germany and France, or even Italy, if we except the work done by Niccola, the sculptor of the wonderful baptistery pulpit at Pisa. The whole of the façade, 147 feet wide, including the two western towers, is completely covered with this magnificent series; there are nine tiers of single figures under canopies, over 600 in number, mostly large life size, with some as much as 8 feet in height, and other smaller statues; these represent angels, saints, prophets, kings and queens of the Saxon, Norman and Plantagenet dynasties, and bishops and others who had been benefactors to the see. There are also forty-eight reliefs with subjects from Bible history, and immense representations of the Last Judgment and the Resurrection, the latter alone containing about 150 figures. The whole composition is devised so as to present a comprehensive scheme of theology and history, evidently thought out with much care and ingenuity. As works of art, these statues and reliefs are of very high merit; the faces are noble in type, the folds of the drapery very gracefully treated with true sculpturesque simplicity and the pose of the figures remarkable for dignity. The main lines of the sculpture throughout are carefully arranged in a severely architectonic manner, so as to emphasize and harmonize with the chief features of the structure. Complete self-restraint is shown in the subordination of each part to the general effect of the whole—one of the great merits of English sculpture down to the 16th century. Of course a great variety of hands and much diversity of workmanship can be traced in this mass of sculpture, but in very few cases does the work fall conspicuously below the general level of excellence, and some of the best figures show the very flower and crown of English plastic art, which was reaching its highest point about the time that the west front of Wells was completed.[1]

The interior of the central tower presents an interesting example of the very skilful way in which the mediæval builders could turn an unexpected constructional necessity into a novel and beautiful architectural feature. While it was being built the four piers of the great tower arches showed signs of failure, and therefore, in order to strengthen them, a second lower arch was built below each main arch of the tower: and on this a third inverted arch was added. Thus the piers received a steady support along their whole height from top to bottom, and yet the opening of each archway was blocked up in the smallest possible degree. The contrasting lines of these three adjacent arches on each side of the tower have a very striking and graceful effect; nothing similar exists elsewhere.

On the south side of the cathedral stands the bishop's palace, a stately moated building, originally built in the form of a quadrangle by Bishop Joceline (1205–1244), and surrounded by a lofty circuit wall. The hall and chapel are very beautiful structures, of rather later date, mostly of the 14th century.

The vicars' college was a secular foundation for two principals and twelve vicars; fine remains of this, dating from the 15th century, and other residences of the clergy stand within and near the cathedral close; some of these are among the most beautiful examples of mediæval domestic architecture which exist anywhere in England.

The church of St. Cuthbert in Wells is one of the finest of the many fine parochial churches in Somersetshire, with a very noble tower and spire at the west end. It was originally an Early English cruciform building, but the central tower fell in during the 16th century, and the whole building was much altered during the Perpendicular period. Though much damaged, a very interesting reredos exists behind the high altar; erected in 1470, it consists of a "Jesse tree" sculptured in relief. Another very beautiful reredos was discovered in 1848, hidden in the plaster on the east wall of the lady chapel, which is on the north side.

(J. H. M.)

WELSHPOOL, or **POOL**, a market-town and municipal and parliamentary borough in Montgomeryshire, North Wales, is situated in the upper Severn valley not far from the river, on the Shropshire Union Canal, and on the Cambrian Railway, 207 miles northwest of London, 8 north of Montgomery, and 18 west of Shrewsbury. The church of St. Mary's, a Gothic structure, restored by Street at a cost of £4000 [$19,440], is a building of some antiquity; Christ Church, in Powis Park, in the Norman style, was erected in 1839. The town-hall, erected in 1873 at a cost of £6000 [$29,160], includes a corn and general market-house, assize courts, and assembly rooms. The Powysland Museum, containing a collection of local fossils and antiquities and a library, was in 1887 vested in the corporation as a free public library and museum. A mile southwest of the town is Powis Castle, the fine old baronial residence of the earl of Powis, and about the same distance to the east is Leighton Hall. The site of an old moated mound is now occupied by a bowling green. The flannel manufacture has now ceased, but there is a large manufactory of tweeds and woollen shawls. The population of the municipal borough (area 19.549 acres) in 1871 was 7370 and in 1881 it was 7107. The population of the parliamentary borough (area 6761 acres) in 1881 was 5211.

About 1109 a castle was begun at Welshpool by Cadwygan ap Bleddyn ap Cynvyn, and completed by Gwenwynwyn. In 1191 it was besieged by Hubert, archbishop of Canterbury, and after being undermined surrendered, but it was retaken by Gwenwynwyn in 1197. It was dismantled in 1233 by Llewelyn, prince of North Wales, and for several generations it remained in the hands of the lords of Powis. During the civil war Lord Powis declared for the royal cause, but he was taken prisoner, and the castle was subsequently demolished. The town was incorporated about 1279 by the lords of Powis. In 1406 its boundaries were enlarged to the present enormous dimensions, and in 1615 it received a charter from James I., which was confirmed and enlarged by Charles II. From the 27th of Henry VIII. it has been included in the Montgomery district of boroughs, which returns one member to parliament. The Welsh name of the town is Trallwns or Trallwm.

WENCESLAUS (1361–1419), German king, was the eldest son of the emperor Charles IV., of the house of Luxemburg. He was born in 1361, and when three years of age was crowned as his father's successor in Bohemia. In 1376 he was elected king of the Romans, and in 1378, on the death of Charles IV., he mounted the Bohemian and German thrones. He repeatedly thought of going to Rome to receive the imperial crown, but this intention was never fulfilled. During his reign there was great confusion both in church and state, and he was wholly powerless to cope with the forces of disorder. Although not without a rude sense of justice, he was of a rough and violent temper, and too fond of pleasure to devote much attention to serious duty. The cities of Germany, in which were some of the best elements of the national life, had been gradually learning how to defend themselves by combining with one another against princes and robber knights; and a wise king or emperor might with their aid have succeeded in re-establishing the authority of the crown. Wenceslaus, however, never understood the importance of the cities, and missed every opportunity of winning their friendship. At a diet in Nuremberg in 1383 an attempt was made to secure the public peace, but the cities, knowing that their liberties were threatened, gave no heed to the measures adopted by the diet. In 1381 the Rhenish cities had formed a confederation, and notwithstanding the threats of Wenceslaus had united with the Swabian League, which was regarded with fear and hatred by most of the southern princes. The battle of Sempach, in which the Swiss confederates gained a decisive victory over the house of Hapsburg, greatly encouraged the cities, but in 1388 a powerful coalition was formed against them, and at the battle of Döffingen their troops suffered so crushing a defeat that they were rendered incapable of further resistance. At a diet held in Eger in 1389 public peace was therefore proclaimed, and the cities of Swabia, the Rhine country, Alsace, the Wetterau, Franconia, and Bavaria were ordered, on pain of the king's displeasure, to dissolve their alliances. This really meant that the princes had both the king and the towns at their mercy. Wenceslaus was not more successful in his native kingdom Bohemia than in Germany. In 1393, in the course of a struggle with the archbishop of Prague, he shocked both friends and enemies by the murder of the vicar-general John of Pomuk, who, after being subjected to torture, was bound and thrown into the river Moldau. With all his faults, Wenceslaus was sincerely anxious to check the violence of the Bohemian nobles. They accordingly plotted against him, and in Jobst of Moravia, to whom Brandenburg had been given in pledge by Sigismund, the brother of Wenceslaus, they found a powerful friend and leader. Wenceslaus was taken prisoner in 1394, and kept for some months in close confinement, and he was set free only when the German princes threatened that if he were detained the conspirators would be treated as enemies of the empire. He was unable to recover more than the appearance of power, and in 1395 he made himself an object of general contempt by selling to John Galeazzo Visconti, of Milan, the dignity of a duke of Lombardy. After the defeat of his brother Sigismund, king of Hungary, at Nicopolis,

---

[1] See Cockerell, *Iconography of Wells Cath.*, 1851; Reynolds, *Wells Cath.*, 1881; and Britton, *Wells Cath.*, 1821. The stone used for this sculpture is from the neighboring Doulting quarry; it was once decorated with gold and color, applied on a ground of fine *gesso* in the usual way.

Wenceslaus came to an understanding with Jobst, to whom he gave Brandenburg in fief; and he afterwards tried to assert authority in Germany by summoning a diet at Frankfort, where, early in 1398, public peace was once more proclaimed. But Wenceslaus could not now undo the results of his indolence and incapacity, and when, in association with the king of France, he supported a plan for the deposition of Popes Boniface IX. and Benedict XIII., and for the assembling of a general council, the spiritual electors and Rupert, elector of the Palatinate, resolved that he himself should be deposed. These electors met at Oberlahnstein, and on the 20th August, 1400, a decree depriving Wenceslaus of the German crown was read by the elector of Mainz as chancellor of the empire. The decree was informal, but Wenceslaus was not in a position to set it aside, and Rupert of the Palatinate was elected king in his stead. Fresh troubles had overtaken him in Bohemia, and in 1402 he was made prisoner by his brother Sigismund, who kept him in confinement for nineteen months. After his release he was not less arbitrary than before, and he caused much discontent by encouraging the disciples of Huss, whom he supported, not apparently because he cared for their doctrines, but because he found it convenient to use them as an instrument against the clergy. On the death of Rupert in 1410 Wenceslaus, while retaining the title of king of the Romans, resigned his claims to the imperial dignity in favor of Sigismund, who was elected to the German throne. Wenceslaus died of a stroke of apoplexy on the 16th August, 1419.

WENDS. See SAXONY, vol. xxi. p. 368, and SLAVS.

WENLOCK, or MUCH WENLOCK, a market-town and municipal borough of Shropshire, England, is situated on a branch of the Great Western Railway, 163½ miles northwest of London, 11 south of Wellington, and 12 southeast of Shrewsbury. There are some beautiful remains of the old priory church, including the southern half of the west front, three bays of the south aisle, and three sides of the south transept. The priory was originally founded as a nunnery by St. Milburg, granddaughter of Penda, about 680, and after being destroyed by the Danes was refounded by Leofric in 1017. Afterwards it was remodelled by Roger de Montgomery as a house for Cluniac monks, and rose to great magnificence. The church of Holy Trinity is Norman and Early English, with portions of Decorated and Perpendicular. The other principal public buildings are the guild-hall, a quaint old timber structure, the market-hall adjoining (erected in 1879 to harmonize with the old building), the corn exchange (1852), and the museum, occupying the site of the hospital of St. John. The town is chiefly dependent on its agricultural trade. There are limestone quarries in the neighborhood. The population of the municipal borough (the area of which is about 33,000 acres and embraces 17 parishes) in 1871 was 19,401 and in 1881 it was 18,442. In addition to the municipal authority the town itself is under the government of a local board. The population of the urban sanitary district (area 9737 acres) in 1871 was 2531 and in 1881 it was 2321.

Wenlock is said to date from the pre-Roman period, but owed its rise to importance to the religious foundation of St. Milburg. It received the grant of a market from Henry III. in 1224. It was incorporated by Edward IV. in 1448, when it also received the privilege of returning members to parliament, but in 1885 it ceased to have separate representation.

WENTWORTH, THOMAS. See STRAFFORD.

WENZEL, KARL FRIEDRICH (1740–1793), German metallurgist, was born at Dresden in 1740. His father was a bookbinder, and Wenzel began to learn the same trade; but finding it monotonous he quietly left home and went to Holland at the age of fifteen. In Amsterdam he took lessons in surgery and chemistry, and then entered the Dutch navy as a surgeon. After some years a sea life lost its charm for him, and he resigned, returning to his native land in 1766 to complete his chemical studies at Leipsic. Wenzel now devoted his attention to metallurgy and assaying, working for a time with great success in the town of his birth. He received a prize for the best solution of a problem in working metals from the Copenhagen Society of Sciences. He also made some very careful chemical experiments, particularly on the mixture of solutions of various salts, and wrote several books on chemical subjects; his claim for remembrance rests on one of these, *Vorlesungen über die chemische Verwandtschaft der Körper*. It was published in 1777; a second edition appeared in 1782, and a third with additions in 1800. In 1780 Wenzel received the appointment of director of mines at Freiberg from the elector of Saxony, and in 1786 that of chemist in the porcelain works at Meissen. He died at Freiberg on February 26, 1793.

The discovery of the law of reciprocal proportions in chemistry (see CHEMISTRY, vol. v. p. 401) has been claimed for Wenzel as the result of his researches on the affinities of bodies, and, on the ground of his work being prior to that of Richter, and much more accurate than the earlier experiments of Bergmann on the same subject, he has been regarded as Dalton's precursor in laying the foundation of the atomic theory. It was pointed out by Hess in 1840 that this was a mistake, since Wenzel's researches led him to no definite conclusions as to invariable and reciprocal proportions in the combination of acids and bases, but rather pointed in the opposite direction. Kopp overlooked this criticism in writing his great *Geschichte der Chemie* (1844–1847), which has deservedly taken the highest place as an authority on chemical history; and, although in the supplementary work published in 1873 he acknowledges his mistake as to Wenzel and confirms Hess's statement, the writers of text-books continue in many cases to give currency to the erroneous view.

WERDAU, a manufacturing town of Saxony, is situated on the Pleisse, in the industrial district of Zwickau, about 40 miles south of Leipsic. Its chief industries are cotton and wool-spinning and the weaving of cloth; but machinery of various kinds, paper, and a few other articles are also manufactured. In addition to the usual schools, Werdau contains a weaving-school. The town is mentioned as early as 1304, and in 1398 it was purchased by the margrave of Meissen, who afterwards became elector of Saxony. The population, 4994 in 1834, was 14,638 in 1885. The adjoining villege of Leubnitz, with 2400 inhabitants, is now practically a part of Werdau.

WEREWOLF. See LYCANTHROPY.

WERGELAND, HENRIK ARNOLD (1808–1845), Norwegian poet and prose writer. See vol. xvii. p. 604.

WERNER, ABRAHAM GOTTLOB (1750–1817), the father of German geology, was born in Oberlausitz, Saxony, 25th September, 1750. The family to which he belonged had been engaged for several hundred years in mining pursuits. His father was inspector of Count Solm's iron-works at Mehrau and Lorzendorf, and from young Werner's infancy cultivated in him a taste for minerals and rocks. The boy showed early promise of distinction. In his fourth year he had learnt to read; in his fifth he could write and cipher; and by the time he was six or seven years old he had grown to be a great reader. Already, when only three years of age, he had begun to collect specimens of stones, and, when he could read, one of his favorite employments was to pore over the pages of a dictionary of mining. At the age of nine he was sent to school at Bunzlau in Silesia, where he remained until 1764, when he joined his father, with the idea of ultimately succeeding him in the post which the latter held there. In his eighteenth year ill-health compelled him to seek the mineral waters of Carlsbad. In journeying thither by way of Freiberg he showed such enthusiasm and knowledge in an excursion in that neighborhood as to attract the notice of the officials there, who invited him to attend their mining school which had been established two years previously. This was the turning point in Werner's career. He came to Freiberg in 1769 when he was nineteen years of age, and found the school in its merest infancy. He soon distinguished himself by his industry and by the large amount of practical knowledge of mineralogy which he acquired. In 1771 he repaired to the university of Leipsic and went through the usual curriculum of study, but continued to devote himself with the greatest ardor to mineralogical pursuits. While still a student he wrote his first work on the external characters of minerals (*Ueber die äussern Kennzeichen der Fossilien*, Leipsic, 1764), which at once gave him a name among the mineralogists of the day. His friends in Freiberg, who had watched his progress with much gratification, called him at the close of his college life to be inspector in the mining school and teacher of mineralogy there. To the development of that school and to the cultivation of mineralogy and geognosy he thenceforth devoted the whole of his active and indefatigable industry. From a mere provincial institution the Freiberg academy under his care rose to be one of the great centres of scientific light in Europe, to which students from all parts of the world flocked to listen to his eloquent teaching. He wrote but little, and though he elaborated a complete system of geognosy and mineralogy he never could be induced to publish it. From the notes of his pupils, however, the general purport of his teaching was well known, and it widely influenced the science of his time. He had the art of infusing into those who listened to him some of his own ardent enthusiasm. His disciples accordingly left his rooms with the determination to preach his doctrine everywhere. They became ardent partisans, and carried on an active propaganda in most countries of Europe. He died at Freiberg on June 30, 1817.

One of the distinguishing features of Werner's teaching was the care with which he taught the succession of geological formations. He showed that the rocks of the earth are not disposed at random, but follow each other in a certain definite order. Unfortunately he had never enlarged his experience by travel, and the sequence of rock-masses which he had recognized in Saxony was believed by him to be of universal application all over the globe. He taught that the rocks were the precipitates of a primeval ocean, and followed each other in successive deposits of world-wide extent. Volcanoes were regarded by him as abnormal phenomena, probably due to the combustion of subterranean beds of coal. Basalt and similar rocks, which even then were recognized by other observers as of igneous origin, were believed by him to be water-formed accumulations of the same ancient ocean. Hence arose one of the great historical controversies of geology. Werner's followers preached the doctrine of the aqueous origin of rocks, and were known as Neptunists; their opponents, who recognized the important part taken in the construction of the earth's crust by subterranean heat, were styled Vulcanists. Though much of Werner's theoretical work was erroneous, science is indebted to him for so clearly demonstrating the chronological succession of rocks, for the enthusiastic zeal which he infused into his pupils, and for the impulse which he thereby gave to the study of geology.

See S. G. Frisch, *Lebensbeschreibung A. G. Werners*, Leipsic, 1825; Cuvier, *Éloge de Werner*; and Lyell, *Principles of Geology*.

WERNER, Friedrich Ludwig Zacharias, German poet, was born at Königsberg on November 18, 1768, and died at Vienna on January 17, 1823. After an irregular life he joined the Church of Rome in 1809, was consecrated priest in 1814, and in his later years was well known as a preacher. As a dramatist he is remembered as the originator of the so-called "fate tragedies"; see Germany, vol. x. p. 485.

WERNIGERODE, a town of Prussian Saxony, about 12 miles to the southwest of Halberstadt, is picturesquely situated on the Holzemme, on the north slopes of the Harz Mountains. It contains several interesting Gothic buildings, including the fine town-house dating from the 14th century. Some of the quaint old houses which have escaped the numerous fires that have visited the town are elaborately adorned with wood-carving. The gymnasium, occupying a modern Gothic building, is the successor of an ancient grammar-school, which existed until 1825. Wooden articles, cigars, and dye-stuffs are among the manufactures of the place. Above the town rises the chateau of the count of Stolberg-Wernigerode. A pavilion in the park contains the library of 96,000 volumes, the chief feature in which is the collection of over 3000 Bibles and over 3600 volumes on hymnology. The population of Wernigerode in 1885 was 9083; including the immediately adjoining villages of Nöscherode and Hasserode, it was 13,804.

Wernigerode is the chief town of the county (grafschaft) of Stolberg-Wernigerode, which still retains a few shreds of nominal independence, though really an integral part of Prussia since the congress of Vienna. It was originally a free and independent imperial fief, and retains its peculiar national colors. The county has an extent of 107 square miles, with 26,484 inhabitants, and includes the Brocken within its limits.

WESEL, a strongly fortified industrial town in Westphalia, Prussia, is situated at the confluence of the Rhine and the Lippe, 46 miles southwest of Münster, and 35 miles southeast of Nimeguen in Holland. The Rhine is here crossed by a large railway bridge and by a bridge of boats. The island of Büderich in mid-stream is fortified, and the town is further protected by detached forts, one of which serves as a *tête-de-pont* on the left bank of the Rhine. Wesel contains some quaint old houses with high-pitched roofs, and a town-house, dating from 1396 with an elaborate façade. The large church of St. Willibrord, a handsome late-Gothic edifice, was consecrated in 1181, though its present form dates from 1521. Since 1883 it has been undergoing a much-needed restoration. St. Matthew's church dates from 1472–77. The two Roman Catholic churches, the commandant's house (built in 1417), the Berlin gateway (1722), and the modern gymnasium and military hospital are among the other chief buildings. Wesel carries on a considerable trade both by railway and its two rivers; wood and fish are perhaps the main exports. It has manufactures of wire, leaden pipes, and other metal goods, pianofortes, sugar, etc. The population, more than half Roman Catholic, was 20,677 in 1885.

Wesel, formerly known as Lippemüde, was one of the points from which Charlemagne directed his operations against the heathen Saxons. The present name is said to be derived from the numerous weasels (Germ., *Wiesel*) at one time found in the neighborhood. In the Middle Ages it was a flourishing commercial town, and a member of the Hanseatic League, and as late as 1495 a free imperial city. A monument outside the town commemorates eleven of Schill's officers who were shot here in 1809 after their unsuccessful attempt at Stralsund. Wesel is occasionally spoken of as Unterwesel, to distinguish it from Oberwesel, a small town also on the Rhine (18 miles south-southeast of Coblentz), and also at one time a free imperial town.

WESEL, John Kuchrath, of Oberwesel (see above), was born in the early years of the 15th century, and died, under sentence of imprisonment for life on a charge of heresy, in the Augustinian convent in Mainz in 1481. He appears to have been one of the leaders of the humanist movement in Germany, and to have had some intercourse and sympathy with the leaders of the Hussites in Bohemia. Erfurt was then the headquarters of a humanism which was at the same time devout and opposed to the realist metaphysic and the Thomist theology which prevailed in the Rhenish universities at Cologne and at Heidelberg. Wesel was one of the professors at Erfurt between 1445 and 1456, and was vice-rector in 1458. In 1460 he was called to be a preacher either at Worms or at Mainz, and in 1479, when an old and worn-out man (he was led into the room by two Franciscans, and was obliged to support himself on a staff), he was brought before the Dominican inquisitor Gerhard Elten of Cologne. The charges brought against him were chiefly based on a treatise, *De Indulgentiis*, which he had composed while at Erfurt twenty-five years before.

It is somewhat difficult to determine the exact theological position of Wesel. Ullmann claims him as a "reformer before the Reformation," but it is more than doubtful that he had that experimental view of the doctrines of grace which lay at the basis of Reformation theology. He held that Christ is our righteousness in so far as we are guided by the Holy Ghost and the love towards God is shed abroad in our hearts, which clearly shows that he held the mediæval idea that justification is an habitual grace implanted in men by the gracious act of God. He seems, however, to have protested against certain mediæval ecclesiastical ideas which he held to be excrescences erroneously grafted on Christian faith and practice. He objected to the whole system of indulgences; he denied the infallibility of the church, on the ground that the church contains within it sinners as well as saints; he insisted that papal authority could be upheld only when the pope remained true to the evangel; and he held that a sharp distinction ought to be drawn between ecclesiastical sentences and punishments and the judgments of God.

The best account of Wesel is to be found in Ullmann's *Reformers before the Reformation*. His tract on *Indulgences* has been published in Walch's *Monumenta Medii Ævi*, vol. i., while a report of his trial is given in Ortuin Gratius's *Fasciculus Rerum Expetendarum et Fugiendarum* (ed. by Browne, London, 1690).

WESER (O. Germ. *Visuracha*, *Wisura*; Lat. *Visurgis*), one of the chief rivers of Germany, formed by the union of the Werra and the Fulda at Münden, in the Prussian province of Hanover, flows to the north and north-northwest, and enters the North Sea below Bremerhafen, to the east of the Jade Bay. The mouth is 170 miles from Münden, but the winding course of the river is 279 miles long; if the measurement be made from the source of the Werra, in Thuringia, the total length of the stream is 439 miles. At Münden the river surface is 380 feet above sea-level; the most rapid fall in its course is between Carlshafen and Minden in Westphalia, where it descends 70 feet in 20 miles. Nearly the entire course of the Weser lies in Prussia, but it also touches part of Brunswick and Lippe, and after flowing through Bremen expands into an estuary separating the duchy of Oldenburg from the Prussian province of Hanover. Between Münden and Minden its course lies through a series of picturesque valleys flanked by the irregular and disjointed mountain system known as the Weser Hills; but after it emerges from these mountains by the narrow pass called the "Porta Westphalica," to the north of Minden, its banks become flat and uninteresting. The breadth of the river varies from 110 yards at Münden to 220 yards at Minden, 250 yards at Bremen, 1¼ miles at Elsfleth, and 7½ miles at its entrance into the sea. The Weser on the whole is shallow; and navigation on the upper Weser, *i.e.*, above Bremen, is sometimes interrupted for months by drought. Sea-going ships may ascend to Elsfleth, though Bremerhafen is the chief port for larger vessels; smaller craft may reach Vegesack, and barges of 200 tons make their way to Münden. The stream discharges itself into the sea amid sandbanks, which leave only a single narrow fairway, 19–22 feet deep at high water and 12 feet at low water; on the upper Weser the navigation of the only available narrow channel, which is interrupted by occasional rapids, is assisted by locks and weirs. The Weser drains a basin estimated at 18,360 square miles. Its principal tributaries on the right are the Aller, Wümme, Drepte, Lune, and Geeste, and on the left the Diemel, Nethe, Emmer, Werre, Aue, and Hunte. The Werra and Fulda are both navigable when they unite to form the Weser; the Aller, Wümme, Geeste, and Hunte are also navigable. Beyond the junction of the Hunte the Weser, hitherto a single stream, is divided into several channels by islands.

The navigation of the Weser was long hampered by the various and vexatious claims and rights of the different states through whose territories it ran. Before 1866 the joint stream, including the Werra and the Fulda, changed its ruler no less than thirty-five times on its way to the sea. In 1823, however, a treaty was made establishing a fixed toll and a uniform system of management; this was further improved in 1856 and 1865; and when Prussia took possession of Hanover and Hesse-Nassau in 1866 the chief difficulties in the way of organizing the river-trade disappeared. The principal town on the Weser is Bremen (population in 1885, 118,043). Other towns past which it flows betwixt Münden and the sea are Carlshafen, Höxter, Holzminden, Bodenwerder, Hameln, Rinteln, Vlotho, Minden, Nienburg, Vegesack, Elsfleth, Braake, Blexen, Geestemünde, and Bremerhafen. The Weser gave name to a department in the short-lived kingdom of Westphalia; the chief town was Osnabrück. A canal between the Wümme and the Oste, and another between the Geeste and the mouth of the Elbe, connect the Weser system with that of the Elbe. A canal is also being constructed from the Hunte to a tributary of the Ems.

WESLEY, an English family of special ecclesiastical distinction, claims descent from the ancient De Wellesleys, one of whom, Guy, was made a thane by Athelstan about 938, the family seat being at Welswe, near Wells, in Somerset. Two brothers, John and Bartholomew, were among the ministers ejected for nonconformity in 1662.

Samuel (1662–1735), son of the above John, was born 17th December, 1662. He was educated at an academy at Stepney, London, and in August, 1683, entered Exeter College, Oxford, as a *pauper scholaris*, shortly after which he joined the Church of England, a step which so deeply offended his family that they left him henceforth to his own resources. While still an undergraduate he published *Maggots, or Poems on Several Subjects never before Handled*, 1685. He graduated B.A. 1688, was ordained priest 24th February, 1689, and the following year was presented to the living of South Ormsby, Lincolnshire. In 1697 he removed to Epworth, Lincolnshire, where he died 25th April, 1735. Among other works he was the author of *Life of Christ* (1693), *Elegies on Queen Mary and Archbishop Tillotson* (1695), *History of the Old and New Testaments in Verse* (1704), *Pious Communicant Rightly Prepared* (1700), and *Latin Commentary on the Book of Job* (1733). After the battle of Blenheim he published (1705) a long poem on *Marlborough, or the Fate of Europe*, for which Marlborough made him chaplain of a regiment. He had nineteen children, of whom three sons, Samuel, John, and Charles, acquired eminence.

Samuel (1690–1739) was born in London, 10th February, 1690, and educated at Westminster school, where he was nominated king's scholar. In 1711 he entered Christ Church, Oxford, and on taking his M.A. degree returned to Westminster as tutor. He lived on intimate terms with Harley, earl of Oxford, Pope, Swift, and Prior, and wrote somewhat clever squibs against Sir Robert Walpole, the Whigs, and the Low Church divines. They were collected and published 1736, reached a second edition 1743, and were reprinted, with notes by James Nicholls and life by W. Nicholls, in 1862. Wesley became master of Tiverton grammar-school in 1732, and died there 6th November, 1739.

John (1703–1791), brother of the preceding and founder of Methodism, was born, probably at Epworth, 17th June (O.S., 28th N S.) 1703. There was a tradition in the family that he was christened John Benjamin, but he never made use of the second name. When his father's rectory was burnt down in 1709 he was for a time left in the building, and narrowly escaped death. He entered Charterhouse in 1714, whence in 1720 he was elected to Christ Church, Oxford. In 1726 he became fellow of Lincoln, and in 1727 graduated M.A. After acting for some time as his father's curate he settled in November, 1729, at Oxford, and began to take pupils. About the same time, along with his brother Charles and others, he commenced that systematic course of religious life, which led to their being termed by the Oxonians Methodists. A full record of the religious labors of Wesley is given under METHODISM (vol. xvi. pp. 192–6). In the organization of Methodism he displayed not only extraordinary energy and capacity for work but remarkable administrative powers. His oratory was colloquial, terse, and homely, but never vulgar, while his expressive and refined features and intense yet reasoned earnestness enabled him to acquire among his followers a personal influence of an unrivalled kind. Although from overwork or exposure he had one or two serious illnesses, he generally enjoyed robust health, an experience probably partly accounted for by his constant journeys on horseback. In 1790 he said, "I do not remember to have felt lowness of spirits for a quarter of an hour since I was born." He preached usually at 5 o'clock in the morning, and frequently twice again in the same day, the number of sermons he delivered in a year being over 800. He continued his labors almost to the last, but wrote, 1st January, 1790, "I am now an old man decayed from head to foot." He died 2d March, 1791. Wesley translated several hymns from the German for the collections edited by him and his brother Charles, but is not known to have been the author of any original hymns (see HYMNS, vol. xii. p. 629). The first collection of *Psalms and Hymns* edited by the brothers appeared anonymously in 1738, and a *Collection of Moral and Sacred Poems from the Most Celebrated Authors*, in 1744. Wesley has no claims to rank as a thinker or even as a theologian, but within certain narrow limits was a skilful controversialist. He was the author of *Primitive Physic* (1747), *Explanatory Notes on the New Testament* (1755), *Notes on the Old and New Testaments* (1764), *Doctrine of Original Sin* (1757), *Survey of the Wisdom of God in Creation* (1763), *Preservative against Unsettled Notions in Religion* (1770), and *A Calm Address to our American Colonies* (1775). He also edited the *Christian Library*, in fifty volumes. His *Works* appeared in 1818, and an eleventh edition, with life by J. Beecham and preface by T. Jackson, was published in 15 vols., 1856–57.

CHARLES (1708–1788), brother of the preceding, was born prematurely at Epworth, 18th December, 1708. He entered Westminster school in 1716, was admitted a king's scholar in 1721, and entered Christ Church, Oxford, in 1726. He accompanied his brother John to Georgia in 1735 as secretary to the managing committee, having been ordained priest a few days before leaving England; but on account of a strong feeling of opposition manifested against him in the religious communities of Frederica he left Georgia for England five months after landing. To a serious illness which happened to him in February, 1738, he attributed a moral change which he associated with conversion and a conscious sense of pardon. He seconded his brother in his evangelizing labors in England with unceasing diligence, and, although not possessing his brother's gifts of oratory and personal magnetism, contributed by his hymns an element of success to the movement of prime and permanent importance. He published no fewer than 4100 hymns of his own composition, and left about 2000 in manuscript. Numerous editions both of the special and general collections of his hymns have been published. Both as regards the number of his compositions and their various excellences, he is entitled to the chief place among Methodist hymn writers (see HYMNS, *ut supra*). He died 29th March, 1788. His *Sermons*, with memoir, appeared in 1816; a *Life*, by Rev. Thomas Jackson, in 1841; and his *Journal*, with notes by Rev. Thomas Jackson, 1849.

Two sons of Charles Wesley attained eminence as musicians: CHARLES (1757–1815), organist of St. George's, Hanover Square, London, who in 1778 published *Six Concertos for the Organ and Harp*; and SAMUEL (1766–1837), organist of the Chapel Royal, noticed below.

See, in addition to the authorities already mentioned, the *Lives* by Hampson (1791), Coke and Moore (1792), Whitehead (1793–96), Southey (1820), Moore (1824), Watson (1831), Miss Wedgwood (1870), and Tyerman (exhaustive and complete) (1870); J. Dove, *Biographical History of the Wesleys* (1833); and G. J. Stevenson, *Memorials of the Wesley Family* (1876).

WESLEY, SAMUEL (1766–1837), musical composer, son of Charles Wesley (see above), was born at Bristol, February 24, 1766, and developed so precocious a talent for music that at three years old he played the organ and at eight composed an oratorio entitled *Ruth*—a fact which is duly chronicled on a curious portrait, painted in 1774, and afterwards engraved, wherein he is represented in the childish costume of the period. Though suffering for many years from an accidental injury to the brain, Wesley was long regarded as the most brilliant organist and the most accomplished extempore fugue-player in England. He may indeed be regarded as the father of our present style of organ-playing, for he it was who, aided by his friends Benjamin Jacob and C. F. Horn, first introduced the works of Sebastian Bach to English organists, not only by his superb playing, but by editing with Horn, in 1810, the first copy of *Das wohltemperirte Clavier* ever printed in England. Wesley's last performance took place, September 12, 1837, at Christ Church, Newgate Street, London, where, after hearing the wonderful performances of Mendelssohn, he was himself induced to play an extempore fugue. He died, October 11, 1837, leaving a vast number of MS. and printed compositions.

His brother Charles (1757–1815) was also an accomplished organist, and still more famous was his son, Samuel Sebastian (1810–1876), Mus. Doc., and organist of Gloucester cathedral.

WESSEL. WESSELUS GANSFORTIUS[1] was born at Groningen in 1400 (Hardenberg), in 1419 (Suffridus Petri), or in 1421, and on the death of his parents was adopted by a noble lady, Oda Clantes, who sent him along with her only son to the famous school at Deventer, which was under the supervision of the Brothers of Common Life, and was in close connection with the convent of Mount St. Agnes at Zwolle, where then lived Thomas a Kempis, the author of the *Imitatio Christi*. At Deventer, where the best traditions of the 14th-century mysticism were still cultivated, Wessel imbibed that earnest devotional mysticism which was the basis of his theology and which drew him irresistibly, after a busy life, to spend his last days among the Friends of God in the Low Countries. From Deventer he went to Cologne to be taught the Thomist theology, which was fondly cherished in that famous Dominican school; and there he learnt realism, which, although he afterwards became a nominalist in metaphysics, always colored his theology. At Cologne, too, he came in contact with humanism. He learnt Greek and Hebrew from monks who, it is said, had been driven out of Greece. The Thomist theology sent him to study Augustine, and his Greek reading led him to Plato, and from both of these great thinkers he learnt much that went to enrich his own theological system. The echoes of the din raised in Paris by the disputes between the realists and the nominalists reached Wessel in Cologne, and a desire to mingle in the fray, or perhaps to learn on which side truth was, induced him to go to Paris, where he remained sixteen years, scholar and teacher. There he eventually took the nominalist side, prompted as much by his mystical anti-ecclesiastical tendencies as from any metaphysical insight; for the nominalists were then the anti-papal party. A desire to know more about humanism sent him to Rome, where we find him in 1470 the intimate friend of Italian scholars and under the protection of Cardinals Bessarion and Della Rovere (afterwards Pope Sixtus IV.). It is said that Sixtus would have gladly made Wessel a bishop, but that he had no desire for any ecclesiastical preferment. From Rome he returned to Paris, and speedily became a famous teacher, gathering round him a band of enthusiastic young students, among whom was Reuchlin. As old age approached he came to have a growing dislike to the wordy theological strife which surrounded him, and turned away from that university discipline, "non studia sacrarum literarum sed studiorum commixtæ corruptiones." After thirty years of academic life he went back to his native Groningen, and spent the rest of his life partly as director in a nuns' cloister there and partly in the convent of St. Agnes at Zwolle. He was welcomed as the most renowned scholar of his time, and it was fabled that he had travelled through all lands, Egypt as well as Greece, gathering everywhere the fruits of all sciences—"a man of rare erudition," says the title page of the first edition of his collected works, "who in the shadow of papal darkness was called the light of the world." His remaining years were spent amid a circle of warm admirers, friends, and disciples, to whom he imparted the mystical theology, the devotion to higher learning, and the deep devotional spirit which characterized his own life. He died on October 4, 1489, with the confession on his lips, "I know only Jesus the crucified." He is buried in the middle of the choir of the church of the "Geestlichen Maegden," whose director he had been.

---

[1] The surname is from Gansfort or Gösevort, a Westphalian village from which his family came; the Christian name is the equivalent of the Greek Basilius.

Wessel has been called one of the "reformers before the Reformation," and the title is a true one if by it is meant a man of deeply spiritual life, who protested against the growing paganizing of the papacy, the superstitious and magical uses of the sacraments, the authority of ecclesiastical tradition, and that tendency in later scholastic theology to lay greater stress in a doctrine of justification upon the instrumentality of the human will than on the objective work of Christ for man's salvation. His own theology was, however, essentially mediæval in type, and he never grasped that experimental thought of justification on which Reformation theology rests.

See *Vita Wesseli. Groningensis*, by Albert Hardenberg, published in an incomplete form in the preface to Wessel's collected works, Amsterdam, 1614 (this preface also contains extracts from the works of several writers who have given facts about the life of Wessel); Muurling, *Com. Hist. Theol. de Wesseli Gansfortii Vita, etc.*, 1831; Ullmann, *Reformers before the Reformation* (the second volume of the German edition is a second and enlarged edition of a previous work, entitled *Johann Wessel, ein Vorgänger Luther's* 1834); Friedrich, *Johann Wessel, ein Bild aus der Kirchengeschichte des 15ten Jahrhunderts*, 1862; Ritschl, *History of the Christian Doctrine of Justification and Reconciliation* (Edin., 1872). Wessel's two most important writings are his Treatise on Prayer (*De Oratione*) and his *Scala Meditationis*.

WESSEX. See ENGLAND, vol. viii. pp. 244–5, 257 *sq.*, and Plate II. of same volume.

WEST, **BENJAMIN** (1738–1820), history and portrait painter, was born in 1738, at Springfield,[1] in Pennsylvania, coming of an old Quaker family who had emigrated from Buckinghamshire. When a boy of seven he began to show his inclinations to art. According to the well-known story, he was sitting by the cradle of his sister's child, watching its sleep, when the infant happened to smile in its dreams, and, struck with its beauty, young Benjamin got some paper, and drew its portrait. The career thus begun was prosecuted amid many difficulties; but his perseverance overcame every obstacle, and at the age of eighteen he settled in Philadelphia as a portrait painter. After a short time he removed to New York, where he practiced his profession with considerable success. In 1760, through the assistance of some friends, he was enabled to complete his artistic education by a visit to Italy, where he remained nearly three years. Here he acquired reputation, and was elected a member of the principal academies of Italy. On the expiry of his Italian visit he settled in London as an historical painter. His success was not long doubtful. George III. took him under his special patronage; and commissions flowed in upon him from all quarters. In 1768 he was one of the four artists who submitted to the king the plan for a royal academy, of which he was one of the earliest members; and in 1772 he was appointed His Majesty's historical painter. He devoted his attention mainly to the painting of large pictures on historical and religious subjects, conceived, as he believed, in the style of the old masters, and executed with great care and much taste. So high did he stand in public favor that on the death of Sir Joshua Reynolds, in 1792, he was elected his successor as president of the Royal Academy, an office which he held for twenty-eight years. In 1802 he took advantage of the opportunity afforded by the peace of Amiens to visit Paris, and inspect the magnificent collection of the masterpieces of art, pillaged from the gallery of almost every capital in Europe, which then adorned the Louvre. On his return to London he devoted himself anew to the labors of his profession, which were, however, somewhat broken in upon by quarrels with some of the members of the Royal Academy. In 1804 he resigned his office, but an all but unanimous request that he should return to the chair induced him to recall his resignation. Time did not at all weaken the energy with which he labored at his easel. When sixty-five he painted one of his largest works, Christ Healing the Sick. This was originally designed to be presented to the Quakers in Philadelphia, to assist in erecting a hospital. On its completion it was exhibited in London to immense crowds, and was purchased by the British Institution for 3000 guineas [$15,309], West sending a replica to Philadelphia. His subsequent works were nearly all on the same grand scale with the picture which had been so successful, but for obvious reasons they did not meet with very ready sale. He died in 1820, in his eighty-second year, and was buried in St. Paul's.

Since his death West's reputation has seriously declined. His works, which fond criticism ranked during his life with the great productions of the old masters, are now considered as in general formal, tame, wanting that freedom of nature and that life which genius alone can breathe into the canvas. His Death of Wolfe is interesting as introducing modern costume instead of the classical draperies which had been previously universal in similar subjects by English artists; and his Battle of La Hogue is entitled to an honorable place among British historical paintings. An account of West's life was published by Galt (*The Progress of Genius*, 1816); and biographies of him occur in Cunningham's *Lives of Eminent British Painters* and Redgrave's *Century of Painters of the English School*.

WESTALL, **RICHARD** (1765–1836), subject painter, was born in Hertford in 1765, of a Norwich family. In 1779 he went to London, and was apprenticed to an engraver on silver, and in 1785 he began to study in the schools of the Royal Academy. He painted Esau Seeking Jacob's Blessing, Mary Queen of Scots Going to Execution, and other historical subjects in water-color, and some good portraits in the same medium, but he is mainly known as a book-illustrator. He produced five subjects for the Shakespeare Gallery, illustrated an edition of Milton, executed a very popular series of illustrations to the Bible and the prayer-book, and designed plates for numerous other works. In 1808 he published a poem, *A Day in Spring*, illustrated by his own pencil. His designs are rather tame, mannered, and effeminate. He became an associate of the Royal Academy in 1792, and a full member in 1794; and during his later years he was a pensioner of the Academy. His last employment was to give art instruction to the Princess Victoria. He died on December 4, 1836. His brother, William Westall, A. R. A. (1781–1850), landscape painter, is mainly known by his illustrations to works of travel.

---

[1] 'Was born at Westdale, a village in Springfield township, Delaware Co., Pa. There are ten Springfields in this state.—AM. ED.

WEST BAY CITY, a city of Bay county,[1] Michigan, United States, is situated on the Saginaw river, near its mouth, opposite Bay City. The city lies in one of the largest lumber districts of the United States, and its industries consist mainly in manufacturing and shipping lumber. It had a population of 9492 in 1885.

WEST BROMWICH, a municipal and parliamentary borough of Staffordshire, England, is situated near the river Tame, and on the Great Western Railway, 6 miles northwest of Birmingham, and 133¾ miles from London. It consists chiefly of one main street, the High Street, upwards of 1½ miles in length. The parish church (All Saints, formerly St. Clement's) is of very early origin, and was given by Henry I. to the convent of Worcester, which subsequently gave it to the priory of Sandwell. The present church, a handsome structure in the Decorated style, was built in 1871–72. The principal other public buildings are the West Bromwich district hospital (erected in 1867 at a cost of £9000 [$43,740], and enlarged in 1882 at a cost of £4000 [$19,440]), the town-hall and municipal offices (1875), the market-hall, the free library (1874), and the Liberal club (1884). There are two public charities—the Stanley (1613) and the Whorwood (1614). Since 1880 the town has manufactured its own gas, but the water is supplied by the South Staffordshire Waterworks Company. There are several large foundries, smelting-furnaces, and forges, but the staple manufactures are the various kinds of implements of wrought-iron used for household, agricultural, or mechanical purposes. The town also possesses brass foundries, maltings, limeklins, and brickyards. There are large collieries in the neighborhood. The area of the municipal and parliamentary borough and urban sanitary district is 5719 acres, with a population in 1871 of 47,918 and in 1881 of 56,295.

In 1230 the manor of West Bromwich was vested in the barons of Dudley, and in 1293 it descended to Walter de Evereus; in 1448 it passed to the Stanleys, from whom it was purchased by Sir Richard Skelton, solicitor-general to Charles I.; and in 1626 it came into the possession of Sir Samuel Clarke, by whose descendants, who subsequently assumed the name of Clarke-Jervoise, it was sold in 1823 to the earl of Dartmouth. West Bromwich was incorporated 13th September, 1882. By the Act of 1885 its parliamentary representation was separated from that of Wednesbury, and it was erected into a parliamentary borough returning one member.

WESTBURY, Richard Bethell, Baron (1800-1873), was the son of Dr. Richard Bethell, and was born at Bradford, Wilts. He was placed in the first class in classics and the second in mathematics at Oxford in 1818, and was elected a fellow of Wadham College. In 1823 he was called to the bar at the Middle Temple. On attaining the dignity of queen's counsel in 1840 he rapidly took the foremost place at the Chancery bar, and was appointed vice-chancellor of the county palatine of Lancaster in 1851. His most important public service was the reform of the then existing mode of legal education, a reform which ensured that students before call to the bar should have at least some acquaintance with the elements of the subject which they were to profess. In 1851 he obtained a seat in the House of Commons, where he continued to sit, first as member for Aylesbury, then as member for Wolverhampton, until he was raised to the peerage. Attaching himself to the Liberals, he became solicitor-general in 1852 and attorney-general in 1856, and again in 1859. On June 26, 1861, on the death of Lord Campbell, he was created lord high chancellor of Great Britain, with the title of Baron Westbury of Westbury, county Wilts. The object of his life was to set on foot the compilation of a digest of the whole law, but for various reasons this became impracticable. The conclusion of his tenure of the chancellorship was unfortunately marked by events which, although they did not render personal corruption imputable to him, made it evident that he had acted with laxity of practice and want of caution. Owing to the reception by parliament of reports of committees nominated to consider the circumstances of the acceptance by him of the resignations of Mr. Wilde, the bankruptcy registrar at Leeds, and Mr. Leonard Edmunds, a clerk in the patent office, and clerk of the parliaments, the lord chancellor felt it incumbent upon him to resign his office, which he accordingly did on July 5, 1865, and was succeeded by Lord Cranworth. After his resignation he continued to take part in the judicial sittings of the House of Lords and the privy council until his death. In 1872 he was appointed arbitrator under the European Assurance Society Act, 1872, and his judgments in that capacity have been collected and published by Mr. F. S. Reilly. As a writer on law he made no mark, and few of his decisions take the highest judicial rank. Perhaps the best known is the judgment delivering the opinion of the judicial committee of the privy council in 1863 against the heretical character of certain extracts from the well-known publication *Essays and Reviews*. His principal legislative achievements were the passing of the Divorce Act, 1857, and of the Land Registry Act, 1862 (generally known as Lord Westbury's Act), the latter of which in practice proved a failure. What chiefly distinguished Lord Westbury was the possession of a certain sarcastic humor; and numerous are the stories, authentic and apocryphal, of its exercise. In fact, he and Mr. Justice Maule fill a position analogous to that of Sydney Smith, convenient names to whom "good things" may be attributed. Lord Westbury died on July 20, 1873, within a day of the time of the death of Bishop Wilberforce, his special antagonist in debate.

A *Life* of Lord Westbury by T. A. Nash is now (1888) in the press.

WEST CHESTER, a borough and the county seat of Chester county, Pennsylvania, United States, is situated 27 miles west of Philadelphia, in a thickly settled farming region, devoted principally to market gardening and the dairy industry. Its population in 1880 was 7046, of whom 1164 were colored and 517 of foreign birth.

WEST DERBY, a town in Lancashire, England, now virtually a suburb of Liverpool, about 4 miles northeast of Liverpool Exchange. It is chiefly composed of houses inhabited by the wealthier merchants of Liverpool. The parish church of St. Mary was re-erected in 1856 in the Early English style from the designs of Sir Gilbert Scott, and has a massive central tower with four pinnacles. The site of the former church is marked by a cross. Attached to the church of St. James, also a modern structure in the Early English style, there is a library of 1800 volumes. In the centre of the old village there is an old court-house, erected in 1662, now belonging to the marquis of Salisbury as lord of the manor. Croxteth Hall, the seat of the earl of Sefton, is in the immediate vicinity. The population of the urban sanitary district (area 5561 acres) was 27,292 in 1871 and 33,614 in 1881.

In Saxon times West Derby gave its name to a hundred. Edward the Confessor had a castle there, the site of which is still called the Castle Hill. In 1266 the manor was bestowed on Edmund, earl of Lancaster. When Henry de Bolingbroke, duke of Lancaster, became king, this and other manors reverted to the crown. In the 4th of Charles I. it was granted to various citizens of London, who resold it in 1639 to James, Lord Stanley and Strange. The property of the Stanleys was afterwards partly sequestrated and partly alienated.

WESTERN AUSTRALIA. This British colony, the portion of Australia that lies to the west of 129°

---

ENCYCLOPÆDIA BRITANNICA, NINTH EDITION

WESTERN AUSTRALIA.

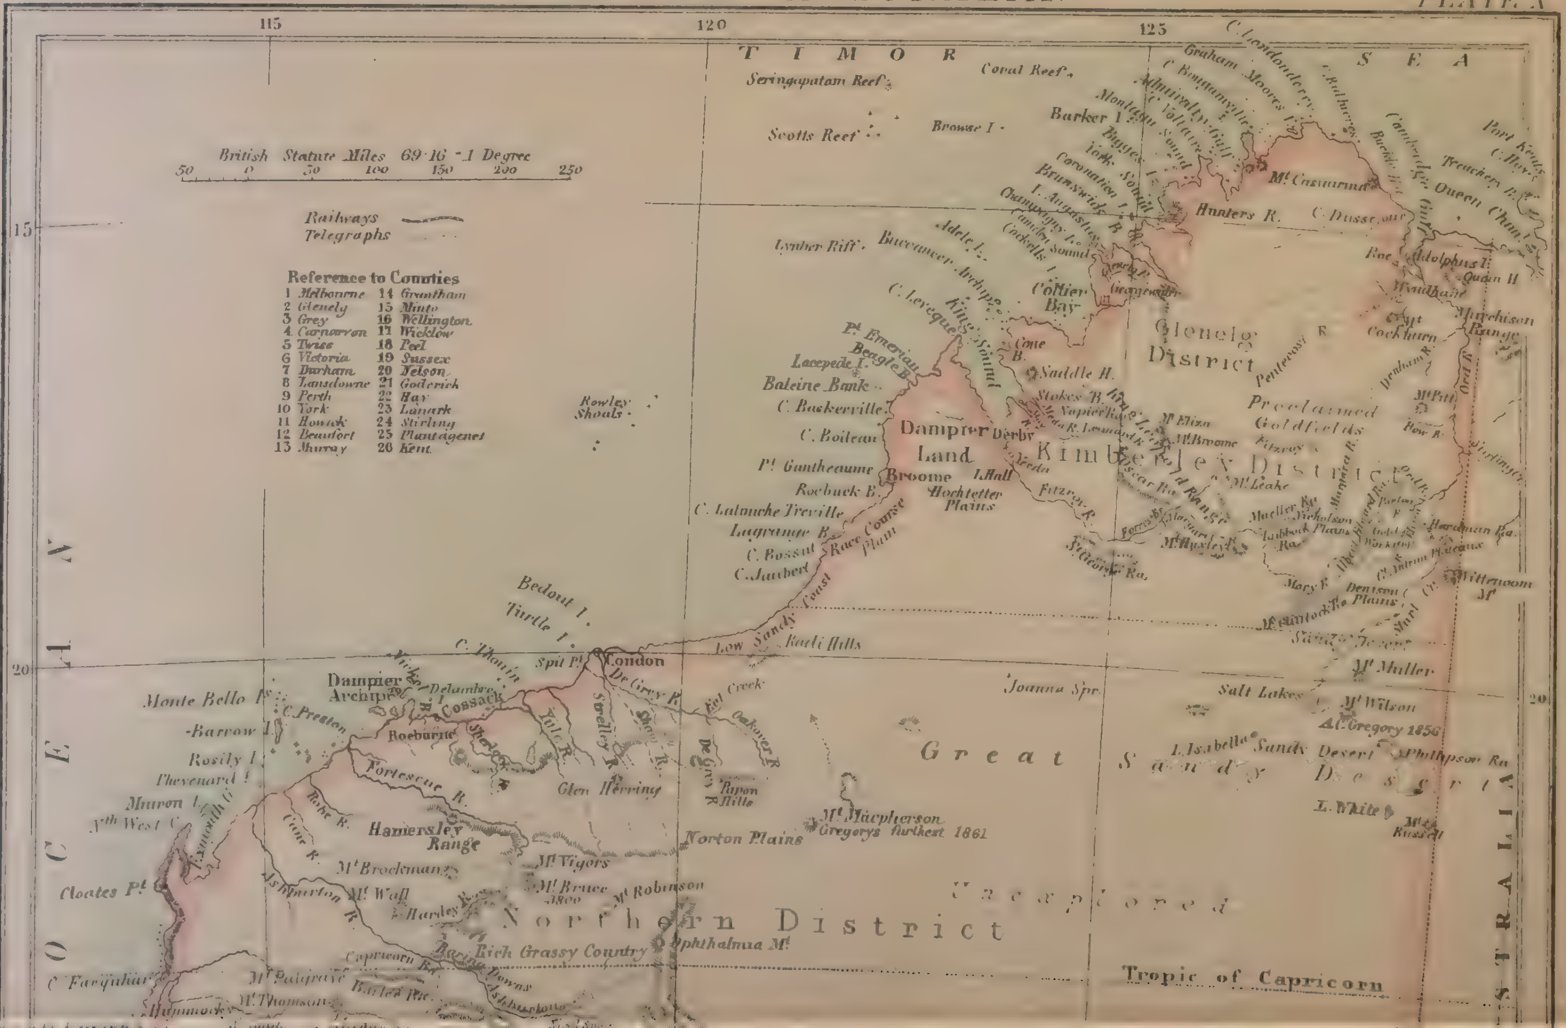

Plate X.

E. long., forming considerably more than one-third of the whole, has an area of 1,060,000 square miles, is 1400 miles in length and 850 in breadth, and has a coast-line of 3500 miles. It is divided into five districts—Central, Central Eastern, Southeastern, North, and Kimberley. The Central or settled district, in the southwest, is divided into twenty-six counties. Apart from the coast lands, the map presents almost a blank, as the major portion is practically a dry waste of stone and sand, relieved by a few shallow salt lakes. The rivers of the south are small,—the Blackwood being the most considerable. To the north of this are the Murray, the well-known Swan, the Moore, the Greenough, and the Murchison. The last is 400 miles long. Sharks Bay receives the Gascoigne (200 miles long), with its tributary the Lyons. Still farther north, where the coast trends eastward, the principal rivers are the Ashburton, the Fortescue, and the De Grey. Kimberley district to the northeast has some fine streams,—the Fitzroy and Ord, and their tributaries, on some of which (the Mary, Elvira, etc.) are the gold-fields, 250 miles south of Cambridge Gulf. The Darling mountain range is in the southwest, Mount William reaching 3000 feet; in the same quarter are Toolbrunup (3341 feet), Ellen's Peak (3420), and the Stirling and Victoria ranges. Gardner and Moresby are flat-topped ranges. Mount Elizabeth rises behind Perth. Hampton tableland overlooks the Bight. In the northwest are Mount Bruce (4000 feet), Augustus (3580), Dalgeranger (2100), Barlee, Pyrton, and the Capricorn range. Kimberley has the Leopold, M'Clintock, Albert Edward, Hardman, Geikie, Napier, Lubbock, Oscar, Mueller, and St. George ranges. The lake district of the interior is in the Gibson and Victoria deserts from 24° to 32° S. The lakes receive the trifling drainage of that low region. Almost all of them are salt from the presence of saline marl.

Climate.—With little or no cold anywhere, the heat of summer over the whole area is considerable. Western Australia differs from the country to the east in having no extensive ranges to collect vapor, while the trade winds blow off the dry land instead of from the ocean; for these two reasons the climate is very dry. Thunderstorms often supply almost the only rainfall in the interior. The southwestern corner, the seat of settlements, is the only portion where rain can be depended on for cultivation; but even there few places have a rainfall of 40 inches. As one goes northward the moisture lessens. The northwest and all the coast along to Kimberley, with most of that district, suffer much from dryness. The northeast comes in summer within the sphere of the northwest monsoons, though just over the low coast-range few showers are known. The south coast, exposed to polar breezes, with uninterrupted sea, has to endure lengthened droughts. In the Swan river quarter the rainfall is in winter, being brought by northwest winds, and summer days have little moisture. While the south wind cools the settled region, it comes over the parched interior to the northern lands. The hot wind of Swan river is from the east and northeast; but it is from the south in summer to Kimberley and the northwest. In one season the land breeze is hot, in another cool, but always dry. In the year 1885 Perth had a rainfall of 29 inches with an evaporation of 66. The temperature ranged from 34° to 109° in the shade. In 1885 there fell 32⅜ inches on 100 days, while Albany had 32 on 138 days, Augusta 46 on 122 days, and York less than 18 on 81 days. Geraldton port received the same as York, but on 63 days, while Cossack, the pearl port of the northwest, had but 9½ on 18 days throughout the year, Northampton showed 21¾, Beverley 14¾, and Eucla 9$\frac{5}{16}$ inches.

Geology.—The base of Western Australia is of granite and its kindred formations, which underlie Silurian or more ancient rocks. Not only are the principal elevations so composed, but throughout the vast extent of bare and sterile land eastward and inland granite is most prominent, rising through recent deposits in knobs and tables onward into South Australia. It is the rock of the Australian desert. The great lake district is a depression, with a granite floor permeated with igneous veins, surrounded by isolated hills and ranges of the Primary and metamorphic rocks. King George's Sound and the mountains around are granite, as also are disjointed ranges northward to Sharks Bay. The streams in the northwest, as well as the Lyons and Gascoigne, take their rise among the old igneous and Palæozoic formations. Kimberley is full of similar rocks. The upper Irwin has garnetiferous granite. Granite, both on the south and western shores, supports the recent deposits of calcareous and arenaceous material. The horizontal sandstone of the interior and the flat-topped hills of sandstone rest upon the granite. The arid region around Sharks Bay, glistening with limestone and sand, has the ancient stone for a foundation, upon which coralline forms built their reefs. All sorts of metamorphic rocks prevail in the Leopold, Weld, and other ranges of Kimberley. Quartz veins are common in the hills. Cambridge Gulf is lined with quartzose grit embodying rock crystal, and the Blackwood river with gneiss. Porphyry appears at York, on the Murchison, and elsewhere. Blue slate occurs on the Canning at Champion Bay, and on Hampton Plains. Carboniferous rocks are present near the Irwin, Canning, Fitzroy, and Murchison. Mr. Hardman traced them northeast over 1500 square miles, bearing coal plants. Secondary formations are rare: a deposit of Oolite 400 feet thick is reported from the Murchison. Tertiary beds of limestone are more plentiful, generally seen near the coast; others of a coralline nature are more recent. Arenaceous limestone cliffs rise two to four hundred feet along the southern shore for hundreds of miles, and similar stone is seen at the junction of the Fitzroy and the Margaret. The spiriferous sandstone on the Denison Plains of Kimberley, like that of the Moresby range, is doubtless Palæozoic. The desert sandstone, so easily decomposed to furnish moving sand-dunes, is regarded as Miocene by Prof. Tate. Freemantle stands upon a recent calcareous sand-stone. Roeburne is similarly situated. The southwest abounds in calcareous accretions. Cape Arid stops with its granite the progress of Tertiary beds. Tertiary agates and jaspers occur on the Ord and the Ashburton. Three terraces lead from the calcareous mud of the northwest shore to the granite of Mount Bruce. Nuyt's Land is probably Pliocene. Volcanic rocks of various ages have burst through other formations, from Kimberley down to King George's Sound. Basalt runs under the limestone of Bunbury, and even rises in pillars; it is in scoriaceous dikes at King Sound. Columnar greenstone occurs about Cape Leeuwin and Cape Naturaliste, while greenstone dikes yield copper in the Champion Bay district. There is a sort of Giant's Causeway at Géographe Bay. Dampier Archipelago, Nickol Bay, the sources of the Fortescue and the De Grey, Glenelg river, Camden harbor, Mount Waterloo, Fitzroy river, and the gold field all show traces of volcanic action. Of the geology of three-fourths of the colony, however, we know scarcely anything. The presence of a new carbonaceous mineral called cliftonite has been recently determined by Mr. L. Fletcher in a meteorite brought by the Rev. Mr. Nicholai from Western Australia.

Minerals.—The earliest mines were of lead and copper in Victoria district, the ore being sent to Geraldton, the port of Champion Bay, 30 miles from the Northampton mines of silver, lead, and copper. Berkshire valley has in addition plumbago, the Irwin antimony, and Woongong silver. The Geraldine lead and silver ores were first worked in 1845, and produced £43,000 in 1878. Wheal Fortune and Tortura mines are of silver-lead; Gelira, Wheel Alpha, and Narra Narra of copper. Iron ores are abundant; they are magnetic at Mount Magnet. Coal has not yet been found in any quantity. Carboniferous rocks are seen in several places, and fair specimens of coal have been obtained. A semi-bituminous mineral near the Swan and the Murray yields a pale oil, which would serve to varnish wood. Gold, long looked for, has been found in Kimberley; and diggers rushed to the country about the Margaret, Mary, and Elvira rivers. The majority did not find returns equal to expenditure; but auriferous quartz of great richness has been reported recently. The proclaimed gold-field lies between 16° and 19½° S., 126° and 129° E. Building stone is found of many varieties.

Agriculture.—This was once confined to the Swan river quarter, but is rapidly extending northward in Victoria district, where the land is free of timber, though the rainfall is very light. In Kimberley tropical produce, especially sugar, cotton, spices, and rice, can be readily raised. The southwest is essentially a farming country, but the soil is generally sandy. In 1886 86,248 acres were in crop (hay, 25,718; wheat, 24,043; barley, 5185; oats, 1766; maize, 171; potatoes, 356; green forage, 1075; vines, 649). No settlement has a finer variety of fruits, and both wine and raisins are being exported. The cottage homesteads are surrounded with pleasant gardens, vineyards, and orchards.

Live Stock.—Timber was too thick in the old settlement for flocks and herds; the squatting districts are eastward of the dividing range and north of the Swan. The want of water both eastward and northward stops progress, but sheep stations are established in oases of reputed eastern deserts. The northwest, in spite of drought, is a favorite locality for squatters; but the better watered Kimberley is regarded as the most hopeful. At the beginning of 1887 129,219,079 acres of the available country were leased by 6469 persons, at the rental of £73,863 [$358,974.18], averaging a little over half a farthing [$ .002½] an acre. The horses numbered 38,360; cattle, 88,254; sheep, 1,809,071; pigs, 24,655; goats, 5301. Some parts, chiefly in the southwest, are troubled with poison plants. Borings in ill-watered places, as the southern and central districts, furnish water for stock. The Angora goat has been a success there. Rabbits already begin to trouble squatters. In proportion to inhabitants, Western Australia has advanced in pastoral pursuits beyond its neighbors, excepting in the quality of stock and the get-up of wool. Of 678,400,220 acres in the colony only 1,851,742 are alienated, though 130,000,000 are leased out by Government. The land laws are liberal. Lessees have pre-emptive rights over parts of runs at 5s. per acre, within a certain period. Inferior land is much cheaper. Kimberley leases are for not less than 50,000 acres at 10s. [$2.43] rent per 1000 acres,—this being the best pastoral country. A certain limited amount of stock is required according to acreage and district. Poisoned land can be leased for twenty-one years at £1 [$4.86] rent per 1000 acres, when the area is granted free if it be fenced and the poison plants eradicated; a license, for that term, of such land, costs one-eighth of that rent. The break-up of the extensive original grants is still essential to further progress.

Flora.—Judged by its vegetable forms, Western Australia would seem to be older than eastern Australia, South Australia being of intermediate age. Indian relations appear on the northern side, and South African on the western. There are fewer Antarctic and Polynesian representatives than in the eastern colonies. European forms are extremely scarce. Compared with the other side of Australia, a third of the genera on the southwest are almost wanting in the southeast. In the latter, 55, having more than ten species each, have 1260 species; but the former has as many in 55 of its 80 genera. Of those 55, 36 are wanting in the southeast, and 17 are absolutely peculiar. There are fewer natural orders and genera westward, but more species. Baron Von Mueller declared that "nearly half of the whole vegetation of the Australian continent has been traced to within the boundaries of the Western Australian territory." He includes 9 *Malvaceæ*, 6 *Euphorbiaceæ*, 2 *Rubiaceæ*, 9 *Proteaceæ*, 47 *Leguminosæ*, 10 *Myrtaceæ*, 12 *Compositæ*, 5 *Labiatæ*, 6 *Cyperaceæ*, 13 *Convolvulaceæ*, 16 *Gramineæ*, 3 *Filices*, 10 *Amaranthaceæ*. Yet over 500 of its tropical species are identified with those of India or Indian islands. While seven-tenths of the orders reach their maximum southwest, three-tenths do so southeast. Cypress pines abound in the north, and ordinary pines in Rottnest Island. Sandalwood (*Santalum cygnorum*) is exported. The gouty stem baobab (*Adansonia*) is in the tropics. *Xanthorrhœa*, the grass tree, abounds in sandy districts. Mangrove bark yields a purple tan. Palms and zamias begin in the northwest. The *Melaleuca Leucadendron* is the paper bark tree of settlers. The rigid-leafed *Banksia* is known as the honeysuckle. *Casuarinæ* are the he and she oaks of colonists, and the *Exocarpus* is their cherry tree. Beautiful flowering shrubs distinguish the southwest; and the deserts are all ablaze with flowers after a fall of rain. Poison plants are generally showy *Leguminosæ*, *Sida*, and the *Gastrolobium*.

The timber trees of the southwest are almost unequalled. Of the Eucalypts, the jarrah or mahogany, *E. marginata*, is first for value. It runs over five degrees of latitude, and its wood resists the teredo and the ant. Sir Malcolm Fraser assigns 14,000 square miles to the jarrah, 10,000 to *E. viminalis*, 2300 to the karri (*E. colossea* or *E. diversicolor*), 2400 to York gum (*E. loxophleba*), 800 to the red gum (*E. calophylla*), and 500 to tuart or native pear (*E. gomphocephala*). Not much good wood is got within 20 miles of the coast. The coachbuilder's coorup rises over 300 feet. Morrel furnishes good timber and rich oil. An ever-increasing trade is done in the timber of the southwestern forests.

Fauna.—Among the mammals are the *Macropus giganteus*, *M. irma*, *M. dama*, *M. brachyurus*, *Lagorchestes fasciatus*, *Bettongia penicillata*, *Phalangista vulpecula*, *Pseudochirus cooki*, *Dasyurus geoffroyi*, *Tarsipes rostratus*, *Antechinus apicalis*, *Perameles obesula*, *Perameles myosurus*, *Myrmecobius fasciatus*. Fossil forms partake of the existing marsupial character *Diprotodon* being allied to the wombat and kangaroo. Nail-bearing kangaroos are in the northwest; the banded one, size of a rabbit, is on Sharks Bay. Nocturnal phalangers live in holes of trees or in the ground. Carnivorous *Phascogalæ* are found in southwest. There are three kinds of wombat. The rock-loving marsupial *Osphranter* is only in the northeast, and *Perameles bougainvillei* at Sharks Bay. The dalgyte or *Petrogale lagotis* is at Swan river and *Hypsiprymnus* in the south. The colony has only two species of wallabies to five in New South Wales. The *Halmaturus* of the Abrolhos is a sort of wallaby; a very elegant species is 18 inches long. The pretty *Dromicia*, 6 inches long, lives on stamens and nectar, like the *Tarsipes*, having a brush at the tip of its tongue; its tail is prehensile. The hare-like *Lagorchestes fasciatus* is a great leaper. The *Hapalotis* of the interior has nests in trees. Beaver rats and other small rodents are troublesome, and bats are numerous. The dingo is the wild dog. The platypus (*Ornithorhynchus*) and the *Echidna* are the only forms of the *Monotremata*. The seal, whale, and dugong occur in the adjacent seas.

The west is not so rich as the east of Australia in birds. Many forms are absent and others but poorly represented, though some are peculiar to the west. The timbered southwest has the greatest variety of birds, which are scarce enough in the dry and treeless interior. Of lizards the west has 12 genera not found in eastern Australia. Of snakes there are but 15 species to 3 in Tasmania and 31 in New South Wales. While the poisonous sorts are 2 to 1 in the east, they are 3 to 1 in the west. The turtle is obtained as an article of food. The freshwater fishes are not all like those of the east. They include the mullet, snapper, ring fish, guard fish, bonita, rock cod, shark, saw fish, parrot fish, and cobbler. Under the head of fisheries may be mentioned the pearl oyster, which is dived for by natives at Sharks Bay; the trepang or bêche-de-mer is also met with in the north. Insects are well represented, especially *Coleoptera*, *Lepidoptera*, *Hymenoptera*, *Hemiptera*, and *Diptera*.

Trade and Commerce.—Safe harbors are few, and hundreds of miles of the coast-line are without shelter for a vessel. The coasting traffic, until recently, was confined to the southwest, from the Sound to Victoria district; but wool is now shipped at the northwest, as well as pearls, while wool, pearl shells, hides, tallow, and gold are claiming attention in the tropical northeast. The imports for 1886 amounted to £758,011 [$3,683,933.46], of which £347,915 [$1,690,866.90] came from the United Kingdom, and £396,871 [$1,928,793.06] from other British possessions, principally the neighboring colonies and India. The exports reached £630,392 [$3,063,705.12]—the main items being wool (£322,578 [$1,567,729.08]), shells (£104,964 [$510,125.04]), guano, timber, sandalwood, pearls, lead, copper, manna gum, and gold. Of these exports, £505,331 [$2,455,908.66] went to Great Britain, and £92,716 [$450,599.76] to other British ports.

Industries.—The pastoral industry occupies the first place. Fisheries are taking an important position (pearl shell, bêche-de-mer, and preserved or tinned fish). Mandurah, at the mouth of the Murray, and Freemantle have preserving sheds for mullet and snapper. Guano beds are worked to much advantage at the Lacepede Isles. Salt is produced largely at Rottnest Island. Raisins are dried, and the oil of castor trees is expressed. The mulberry tree succeeds well, and sericulture is making progress. Dugong oil is got from Sharks Bay. Honey and wax are becoming valuable exports; from the abundance of flowers the hives can be emptied twice a year. Manna and gums of various kinds are among the resources of the country. Among the wines made are the Riesling, Burgundy, Sweetwater, Hock, and Fontainebleau.

Roads and Railways.—Excellent roads were made during the period of convict labor. The northern railway from Northampton mines to Port Geraldton is 35 miles long. The eastern line is from Freemantle through Perth to Guildford (20 miles) and to Beverley (90 miles). A concession of 12,000 acres per mile is bringing the rail from York northward to Victoria district, and from Beverley southward to Albany on King George's Sound. Communication between the several ports is conducted by steamers, which have been aided by a state subsidy.

Administration.—Western Australia is a crown colony, administered by a governor, his executive council, and a legislative council partly nominated by the governor. The colonial revenue for 1887 amounted to £461,322 [$2,242,024.92], the expenditure to £456,897 [$2,220,519.42].

Education.—As in other colonies, the denominational system formerly prevailed; but lately an effort has been made to have public schools on a broader basis. The state in 1886 granted £7505 [$36,474.30] for 3169 scholars in the public schools, and £1415 [$6876.90] for 1339, principally Roman Catholics, in the assisted schools. The Perth *Inquirer* was the first newspaper; there are now 11 in the colony.

Population.—Of the 42,000 inhabitants 7000 are in Perth, the capital, 5000 in Freemantle, 1000 at Albany, 900 at York. Some trouble from the aborigines was experienced by settlers at first, but now many of them are useful upon stations, making good shepherds. A successful mission for

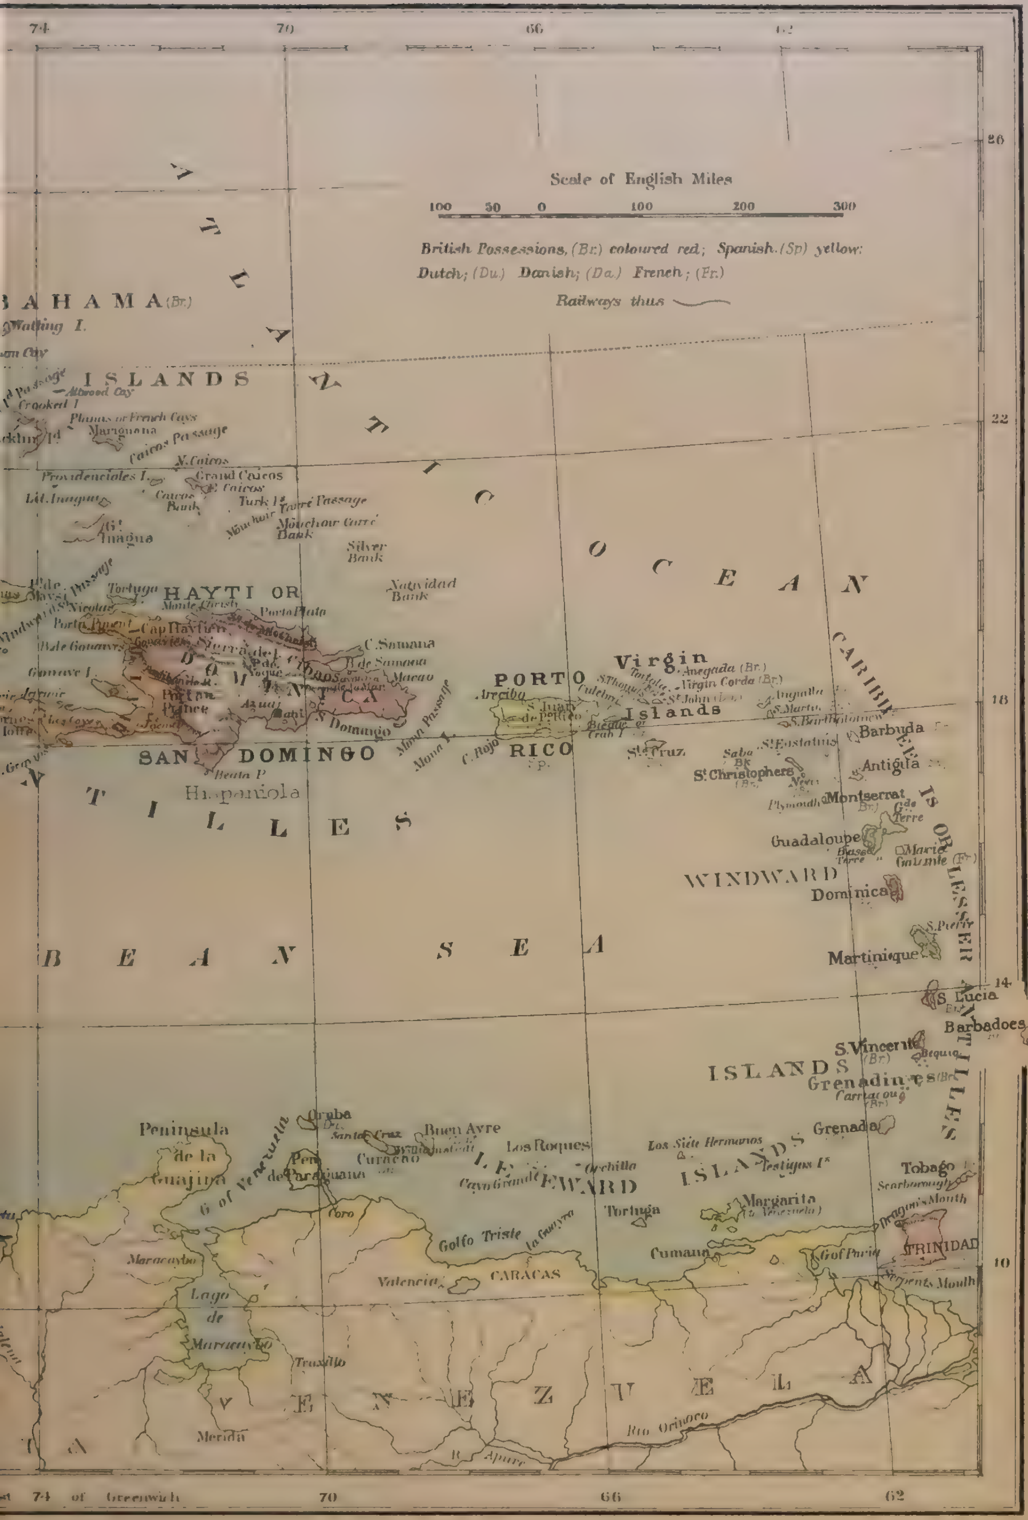
NDIES

PLATE XI.



natives has been conducted for many years at New Norcia, about 80 miles north of Perth, by Spanish monks.

History.—Both the western and northern coasts of the colony are pretty accurately laid down on maps said to date from 1540 to 1550, where the western side of the continent terminates at Cape Leeuwen. The discovery of the coast may be attributed to Portuguese and Spanish navigators, who were in the seas northward of Australia as early as 1520. The next visitors, nearly a century later, were the Dutch. Edel explored northward in 1619, and De Witt in 1628. The "Gulde Zeepaard" in 1627 sailed along the south coast for 1000 miles, the territory being named Nuyt's Land. Tasman made a survey of the north shore in 1644, but did not advance far on the western border. Dampier was off the northwest in 1638 and 1696, naming Sharks Bay. Vancouver entered King George's Sound in 1791. The French under D'Entrecasteaux, were off Western Australia in 1792; and their commodore Baudin, of the "Géographe" and "Naturaliste," in 1801 and 1802 made important discoveries along the western and northwestern shores. Captain Flinders about the same time paid a visit to the Sound, and traced Nuyt's Land to beyond the South Australian boundary. Freycinet went thither in 1818. Captain King surveyed the northern waters between 1818 and 1822.

The earliest settlement was made from Port Jackson, at the end of 1825. Owing to a fear that the French might occupy King George's Sound, Major Lockyer, carried thither a party of convicts and soldiers, seventy-five in all, and took formal British possession, though Vancouver had previously done so. Yet the Dutch had long before declared New Holland, which then meant only the western portion of Australia, to be Dutch property. This convict establishment returned to Sydney in 1829. In 1827 Captain Stirling was sent to report upon the Swan river, and his narrative excited such interest in England as to lead to an actual free settlement at the Swan river. Captain Freemantle, R.N., in 1827 took official possession of the whole country. Stirling's account stimulated the emigration ardor of Sir F. Vincent, and Messrs. Peel, Macqueen, etc., who formed an association, securing from the British Government permission to occupy land in Western Australia proportionate to the capital invested, and the number of emigrants they despatched thither. In this way Mr. Peel had a grant of 250,000 acres, and Colonel Latour of 103,000. Captain (afterwards Sir James) Stirling was appointed lieutenant-governor, arriving June 1, 1829. The people were scattered on large grants. The land was poor and the forests heavy; provisions were at famine prices; and many left for Sydney or Hobart Town. The others struggled on, finding a healthful climate, and a soil favoring fruits and vegetables whilst their stock grazed in the more open but distant quarters. The overland journey of Eyre from Adelaide to King George's Sound in 1839-1840, through a waterless waste, discouraged settlers; but Grey's overland walk in 1838 from Sharks Bay to Perth revealed fine rivers and good land in Victoria district, subsequently occupied by farmers, graziers and miners. Commanders Wickham and Stokes about that time made discoveries on the northern coast. Roe was an active explorer, and Austin in 1854 investigated the country to the eastward. F. H. Gregory traced the Gascoigne in 1857, and made known superior land to the northwest about Nickol Bay four years later. Austin in 1864 saw a good future for the Glenelg district, previously described by Grey. A. Gregory was at the northeast in 1856, and J. Forrest in 1870 proved the way along the south coast to be no hopeless desert. Giles crossed from the east. Major Warburton in 1873 had severe trials with his camels before reaching De Grey river from the east. The Messrs. Forrest suffered much in another attempt to penetrate the eastern barren country. A. Forrest had a successful tour in 1877 through the Kimberley province; two years later he made the connection between Kimberley and the northwest. The difficulties of the settlers had compelled them to seek help from the British treasury, in the offer to accept convicts. These came in 1850; but transportation ceased in 1868, in consequence of loud protests from the other colonies. Seeking responsible government, the settlers were told in 1888 that, if this were granted for the southern part, the north would still be retained as a crown colony. The discoveries of lead and copper, and lately of gold, must increase the working community; while the newly opened pastures have brought in a great accession of stockholders. Settlers are arriving from South Australia and other colonies, so that the prospects of Western Australia are brightening. (J. BO.)

WEST HAM, an eastern suburb of London, in the county of Essex, which gives its name to an extensive parish, urban sanitary district, and parliamentary borough stretching north and south from Wanstead and Leyton to the Thames, and east and west from Little Ilford and East Ham to the river Lea. West Ham proper is situated on the main road between Stratford and Plaistow, three-quarters of a mile southeast of the Stratford station on the Great Eastern Railway, but the original village is now completely absorbed in the new buildings which have sprung up around it. The church of All Saints has an Early English nave and a good Perpendicular tower, but the architecture of the remainder of the building is nondescript and incongruous. Some mural paintings have within recent years been laid bare, and there are a number of old monuments. Among other public buildings are the West Ham, Stratford, and South Essex dispensary (1878), and the conference hall for public meetings. There are a considerable number of charities. West Ham park, 80 acres in extent, was opened 20th July, 1874, at a cost of £25,000 [$121,500]. A large public cemetery was consecrated in 1857, and there is a Jews' cemetery. The northern main sewer of the metropolitan main drainage system traverses the parish, the chief pumping station being at Abbey Mills. In 1762 West Ham had 700 houses. Morant, in his *History of Essex*, 1768, describes it as the "residence of considerable merchants, dealers, and industrious artists." Since then its character has completely changed, and it is now a busy industrial district, its prosperity being in a large degree traceable to the formation of the Victoria and Albert docks at Plaistow. It possesses large chemical works, match works, candle factories, manure works, flour mills, cocoa-nut fibre factories, patent leather cloth factories, smelting works, and copper works. The population of the parish, urban sanitary district, and parliamentary borough (area about 5390 acres) in 1871 was 62,919, and in 1881 it was 128,953.

At the time of the Conquest West Ham belonged to Alestan and Leured, two freemen, and at Domesday to Ralph Gernon and Ralph Peverel. West Ham village was included in the part which descended to the Gernons, who took the name of Montfichet. It received the grant of a market and annual fair in 1253, but these have not been kept for many years. The lordship was given to the abbey of Stratford, and, passing to the crown at the dissolution, it formed part of the dowry of Catherine of Portugal, and was therefore called the Queen's Manor. In 1885 the urban sanitary district was erected into a parliamentary borough, returning two members for the Northern and Southern Divisions respectively.

WEST HOUGHTON, a township of Lancashire, England, on the Lancashire and Yorkshire Railway, 5 miles west-southwest of Bolton, 15 northwest of Manchester, and 5 east-northeast of Wigan. The church of St. Bartholomew was rebuilt in 1870 in the Gothic style at a cost of £6000 [$29,160]. There are coal-mines in the neighborhood, and the town possesses a silk factory, print-works, and cotton-mills. The population of the urban sanitary district (area 4341 acres) in 1871 was 6609 and in 1881 it was 9197.

West Houghton before the time of Richard II. was a manor belonging to the abbey of Cockersand. It was confiscated at the Reformation, and since then has been vested in the crown. It is now held by the representatives of the late Colonel Wilbraham. The army of Prince Rupert assembled on West Houghton moor before the attack on Bolton.

Plates XI., XII.

WEST INDIES. This important archipelago received the name of the West Indies from Columbus, who hoped that, through the islands, he had found a new route to India. It is also sometimes known as the Antilles (a name, however, more properly applied to a part than to the whole), as Columbus, on his arrival here, was supposed to have reached Antilla, a fabled country, said to lie far to the westward of the Azores, which found a vague and uncertain place on the maps and charts of many geographers before that time. Columbus first landed on St. Salvador, or Watling Island, named by the natives Guanahani, and several voyages to this new land were made in rapid succession by the great discoverer, resulting in the finding of most of the larger islands, and a more intimate knowledge of those already known. The importance of its latest possession was at once recognized by the court of Spain, and, as a first move towards turning the West Indies to profitable account, numbers of the natives, for the most part a harmless and gentle people, were shipped beyond seas and sold into slavery, others being employed in forced labor in the mines which the Spaniards had opened throughout the archipelago, and from which large returns were expected. Thus early in its history began that traffic in humanity with which the West India plantations are so widely associated, and which endured for so long a time. Goaded to madness by the wrongs inflicted upon them, the aborigines at last took arms against their masters, but with the result which might have been expected—their almost utter extirpation. Many of the survivors sought release from their sufferings in suicide, and numbers of others perished in the mines, so that the native race soon almost ceased to exist. Spain was not long allowed to retain an undisputed hold upon the islands: British and Dutch seamen soon sought the new region, accounts concerning the fabulous wealth and treasure of which stirred all Europe, and a desultory warfare began to be waged amongst the various voyagers who flocked to this El Dorado, in consequence of which the Spaniards found themselves gradually but surely forced from many of their vantage grounds, and compelled very materially to reduce the area over which they had held unchecked sway. The first care of the English settlers was to find out the real agricultural capabilities of the islands, and they diligently set about planting tobacco, cotton, and indigo. A French West India Company was incorporated in 1625, and a settlement established on the island of St. Christopher, where a small English colony was already engaged in clearing and cultivating the ground; these were driven out by the Spaniards in 1630, but only to return and again assume possession. About this time, also, the celebrated buccaneers, Dutch smugglers, and British and French pirates began to infest the neighboring seas, doing much damage to legitimate traders and causing commerce to be carried on only under force of arms, and with much difficulty and danger. Indeed, it was not till the beginning of last century—some time after Spain had, in 1670, given up her claim to the exclusive possession of the archipelago—that these rovers were rendered comparatively harmless; and piracy yet lingered off the coasts down to the early years of the present century. In 1640 sugar-cane began to be systematically planted, and the marvellous prosperity of the West Indies commenced; it was not from the gold and precious stones, to which the Spaniards had looked for wealth and power, but from the cane that the fortunes of the West Indies were to spring. The successful propagation of this plant drew to the islands crowds of adventurers, many of them men of considerable wealth. In Barbados alone, it is said that 50,000 British subjects arrived in one year about this period. The West Indies were for many years used by the English Government as penal settlements, the prisoners working on the plantations as slaves. In 1655 a British force made an unsuccessful attack on Hayti, but a sudden descent on Jamaica was more fortunate in its result, and that rich and beautiful island has since remained in the possession of Great Britain. The Portuguese were the first to import Negroes as slaves, and their example was followed by other nations having West Indian colonies, the traffic existing for about 300 years. In 1660 a division of the islands was arranged between England and France, the remaining aborigines being driven to specified localities, but this treaty did not produce the benefits expected from it, and as wars raged in Europe the islands frequently changed hands. Hayti, now divided into two republics, has suffered much from internal broils and revolutions.

The West Indies are situated in about 20° N. lat. and 75° W. long., and form a broken, but upon the whole, continuous barrier, shutting out as it were the Atlantic Ocean, with its contents of 34,804,000 cubic miles of water, and its mean depth of 2135 fathoms, from the lesser basins of the Caribbean Sea and Gulf of Mexico, containing respectively 1,675,000 cubic miles and 628,000 cubic miles, and with mean depths of 1269 fathoms and 772 fathoms. These two seas are separated by the island of Cuba and the isthmus of Yucatan, with the great Campeche Bank surrounding three sides of the latter. Spring tides do not rise above 4 feet, nor neaps above 2½ feet. Complicated currents and dangerous shoals, especially in the neighborhood of the Bahamas, necessitate the exercise of considerable skill and care when navigating this region. The equatorial current sweeps around Trinidad and the Antilles into the Caribbean Sea, and the Gulf Stream passes from the Gulf of Mexico by way of the Florida Channel. The well-known Sargasso Sea lies to the northeast of the islands.

The physical features of the region are clearly shown on the accompanying map (Plate XI.), the orographical and bathymetrical data being reproduced from a yet unpublished chart intended to illustrate one of the "Challenger" Reports, and inserted here by permission of Dr. Murray, Director of the "Challenger" Expedition Commission. In the Gulf of Mexico and Caribbean Sea there are 394,850 square miles covered by depths of 100 fathoms and less, 363,950 square miles with from 100 to 500 fathoms, 263,250 square miles by from 500 to 1000 fathoms, 572,950 square miles by from 1000 to 2000 fathoms, 274,850 square miles by from 2000 to 3000 fathoms, and 7750 square miles by over 3000 fathoms. The average surface temperature of the sea in the neighborhood of the islands is from 75° to 78° F. in February, from 79° to 80° in May, and from 82° to 84° in August. The mean annual temperature of the Gulf Stream in the Florida Channel is 80° F.

The various groups which go to form the West Indies have in some cases more than one name, but the following classification is that usually adopted. To the north lie the Bahamas, situated upon the Great Bahama Bank, south from which is Cuba; Jamaica, again, lies to the south of the latter, and to the east of Jamaica are Hayti and Porto Rico. Still farther to the east lie the Virgin Islands, south of which are the Caribbee Islands, or Antilles proper, divided by mariners into the Leeward and Windward groups. Trini-

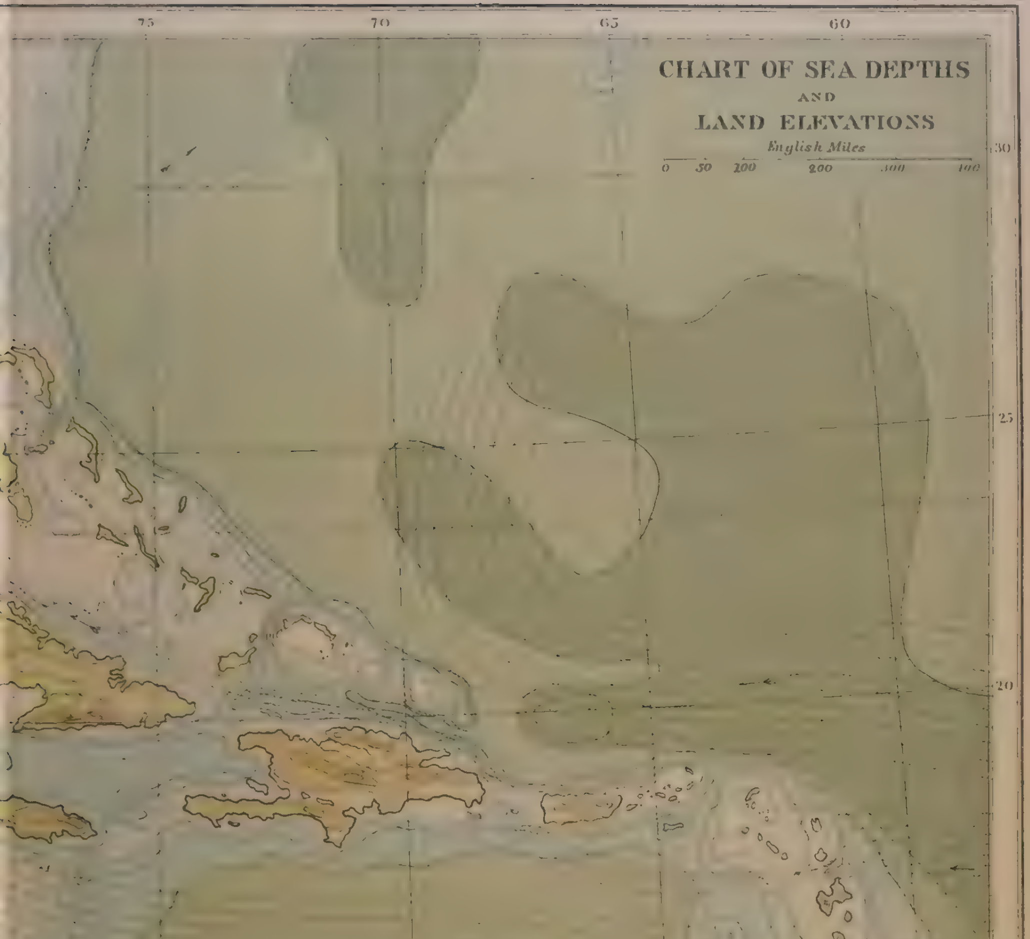
NDIES. PLATE XII.



dad lies close to the coast of South America. Thus the whole archipelago stretches, in the form of a rude arc, from Florida and Yucatan in North America to Venezuela in South America.

The principal rivers are the Cauto, the Sagua la Grande, and the Sagua le Chica in Cuba, the Rio Grande and Plantain Garden in Jamaica, and the Gran Yacui, the Neiba, and Yuna in Hayti. All have, necessarily, short courses, and none of them are of much importance.

The population is almost entirely of European, Negro, or East-Asiatic origin. The Negroes far outnumber the others, but the Asiatics are rapidly increasing in numbers.

As in most tropical countries where considerable heights are met with—and here over 15,500 square miles lie at an elevation of more than 1500 feet above sea-level—the climate of the West Indies (in so far at least as heat and cold are concerned) varies at different altitudes, and on the higher parts of many of the islands a marked degree of coolness may generally be found. With the exception of part of the Bahamas, all the islands lie between the isotherms of 77° and 82° F. The extreme heat, however, is greatly tempered by the sea-breezes, and by long, cool, refreshing nights. Frost is occasionally formed in the cold season when hail falls, but snow is unknown. The seasons may be divided as follows. The short wet season, or spring, begins in April and lasts from two to six weeks, and is succeeded by the short dry season, when the thermometer remains almost stationary at about 80° F. In July the heat increases to an extent well nigh unbearable, and thunder is heard to rumble in the distance. No change need now be looked for till after a period varying from the end of July to the beginning of October, when the great rainfall of the year commences, accompanied by those tremendous and destructive hurricanes, so intimately and truly associated with popular ideas regarding this region, on which the annual rainfall averages 63 inches—an amount of precipitation calculated to represent a mass of water of 12,465,437,000,000 cubic feet. This season is locally known as the "hurricane months." Out of a total of 355 hurricanes, or, more properly, cyclones, recorded during the last three hundred years, 42 have occurred in July, 96 in August, 80 in September, and 69 in October. These storms commence in the Atlantic and towards the east. For a day or two they follow a westerly course, inclining, at the same time, one or two points towards the north, the polar tendency becoming gradually more marked as the distance from the equator increases. When the hurricanes reach latitude 25° N., they curve to the northeast, and almost invariably wheel round on arriving at the northern portion of the Gulf of Mexico, after which they follow the coast line of North America. Their rate of speed varies considerably, but may be said to average 300 miles per day among the islands. The usual signs of the approach of the cyclones are an ugly and threatening appearance of the weather, sharp and frequent puffs of wind increasing in force with each blast, accompanied with a long heavy swell and confused choppy sea, coming from the direction of the approaching storm. But the barometer is the true guide, which should always be consulted when a cyclone is expected. If a sudden fall of the barometer is observed, or even if a marked irregularity of its diurnal variations takes place, a storm may be confidently looked for. In some of these hurricanes the barometer has been found to stand 2 inches lower in the centre of the disturbance than it did outside the limits of the storm field. December marks the commencement of the long dry season, which, accompanied by fresh winds and occasional hail showers, lasts till April. The average temperature of the air at Barbados, which may be taken as a favorable average, is, throughout the year, 80° F. in the forenoon, and about 82° in the afternoon. The maximum is 87°, and the minimum 75°.

The geological features of the West Indies are interesting. A calcareous formation, often assuming the shape of marbles, is most common, and indeed preponderates above all the other rocks to a remarkable degree. The Bahamas, which are low, are composed wholly of limestone formed from coral and shells, crushed into a concretionary mass, hard on the surface, but soft where not exposed to atmospheric action, full of holes and indentations, and disposed in nearly level beds. The lower parts of the Antilles present a like formation where the land does not rise above 230 feet. Cuba shows two distinct compact limestones, one a clayey sandstone and the other a gypsum. These are confined to the central and western parts of the island, which has also syenitic rocks, with some serpentine from which petroleum is obtained. Four-fifths of Jamaica consists of limestone overlying granite and other igneous rocks. Hayti has much metamorphic strata, generally greatly uptilted, and often exhibiting marked folding. These rocks appear to have been limestones, shales, sandstones, and conglomerates. Auriferous quartz veins occur in slates, where these are found near eruptive masses; there is also some syenite, and both active and extinct craters are upon this island. The western Antilles are entirely of volcanic origin, and coral reefs occur along their shores; coral reefs are also presented on the coasts of many of the other islands, but are most irregular in their mode of occurrence, sometimes forming complete belts surrounding the land on all sides, but oftener appearing in the shape of unconnected masses. The fossils of the West Indies are important, as from many of them clear evidence is obtained to show that at no very remote geological period the islands formed part of the adjoining continents. The remains of the megatherium, mylodon, and cabylara, essentially South-American, are also found in North America, but only along the seaboards of Georgia and Carolina. As these are also found in some of the West India islands, as well as in South America, it is thus perfectly clear that at one time the archipelago formed a land passage between the two great divisions of the New World. These remains have also been found in conjunction with the fossil human skeletons of Guadeloupe and the rude weapons associated with them. We may therefore fairly conclude that in Pleistocene times the West Indies formed the connecting link between the two Americas. The occurrence of tree stumps *in situ* several feet below high-water mark also points to a comparatively late sinking of the land in some areas.

The mineral wealth of the islands is not remarkable. Gold, silver, iron, copper, tin, platinum, lead, coal of a poor quality, cobalt, mercury, arsenic, antimony, manganese, and rock salt either have been or are worked. Of late years asphalt has been worked to considerable advantage among the pitch lakes of Trinidad. Opal and chalcedony are the principal precious stones.

The fauna of the region is Neotropical, belonging to that region which includes South and part of Central America, although great numbers of birds from the North-American portion of the Holarctic[1] realm migrate to the islands. The resident birds, however, eighteen genera of which are certainly Neotropical, show beyond doubt to which faunal region the islands properly belong. Mammals are, as in most island groups, rare. The agouti abounds, and wild pigs and dogs are sufficiently numerous to afford good sport to the hunter, as well as smaller game, in the shape of armadillos, opossums, musk-rats, and raccoons. The non-migrating birds include trogons, sugar-birds, chatterers, and many parrots and humming birds. Water-fowl and various kinds of pigeons are in abundance. Reptiles are numerous: snakes—both the boa and adder—are innumerable, while lizards, scorpions, tarantulas, and centipedes are everywhere. Insects are in great numbers, and are often very annoying. Among domestic animals mules are largely reared, and where the country affords suitable pasture and forage cattle-breeding is extensively engaged in. Much attention is not bestowed on horse-breeding, except in regard to the comparatively small numbers required for use in driving and riding by the officials and planters. Goats abound, and large flocks of sheep are kept for the sake of their flesh alone, as the climate is not adapted for wool-growing.

---

[1] [The Nearctic is the American portion of the entire or Holarctic region. See vol. vii. pp. 233-4.—AM. ED.]

The flora of the islands is of great variety and richness, as plants have been introduced from most parts of the globe, and flourish either in a wild state or under cultivation; grain, vegetables, and fruits, generally common in cool climates, may be seen growing in luxuriance within a short distance of like plants which only attain perfection under the influence of extreme heat, nothing being here required for the successful propagation of both but a difference in the height of the lands upon which they grow. The forests, which are numerous and wide-spreading, produce the most valuable woods and delicious fruits. Palms are in great variety, and there are several species of gum-producing trees. Some locust trees have been estimated to have attained an age of 4000 years, and are of immense height and bulk. *Piptadenia* is, on account of its almost imperishable character when in the ground, universally used as a material for house-building. *Xanthoxylon*, the admired and valuable satin-wood of commerce, is common; *Sapindus* finds a ready market on account of its toughness; crab-wood yields a useful oil and affords reliable timber; and tree ferns of various species are common. Pimento is peculiar to Jamaica. But it is to the agricultural resources of the islands that the greatest importance attaches. For centuries almost the whole care of the planters was bestowed upon the cultivation of the sugar-cane and tobacco plant, but since the emancipation of the slaves and the fall in the price of sugar attention has been turned to the production of other and more varying crops. Perhaps this change has been most marked in the trade which has now sprung up in fruit, which is very large, and annually increasing. Sugar, however, is still the staple product, and has for some time been grown in considerable quantities on the small holdings of the negroes and other laborers. Crops of tobacco, beans, pease, maize, and Guinea corn are also becoming popular, and a species of rice, which requires no flooding for its successful propagation, is largely produced. *Hymenachne striatum* covers many of the plains, and affords food for numerous herds of cattle.

For further particulars see CUBA, JAMAICA, HAYTI, and other articles on separate islands. Interesting information regarding the state of the islands immediately after the abolition of slavery may be found in *Extracts from Papers Printed by Order of the House of Commons*, 1839, *Relative to the West Indies*; and notices of the earlier British settlers are contained in Hotten's *Original Lists of Emigrants*, etc.

(J. GU.)

WESTMACOTT, SIR RICHARD (1775–1856), one of the principal English sculptors of the classical revival, was born in London in 1775, and while yet a boy learned the rudiments of the plastic art in the studio of his father, who was then a sculptor of some reputation. In 1793, at the age of eighteen, he went to Rome and became a pupil of the Venetian Canova, who was then at the height of his fame. Under the prevailing influences of Italy, at that time Westmacott devoted all his energies to the study of classical sculpture, and throughout his life his real sympathies were with pagan rather than Christian art. Within a year of his arrival in Rome he won the first prize for sculpture offered by the Florentine academy of arts, and in the following year (1795) he gained the papal gold medal awarded by the Roman Academy of St. Luke. On his return to London Westmacott began to exhibit his works yearly at the Royal Academy, and soon became the most popular of English sculptors. In 1805 he was elected an associate, and in 1811 a full member of the Royal Academy; in 1827 he was appointed to succeed Flaxman as Royal Academy professor of sculpture, and in 1837 he was knighted. A very large number of important public monuments were executed by him, including many portrait statues; but, like most sculptors of the pseudo-classical revival, he was not successful with this class of draped figures. Little can be said in praise of such works as the statue on the duke of York's column, the portrait of Fox in Bloomsbury Square, or that of the duke of Bedford in Russell Square. Much admiration was expressed at the time for Westmacott's monuments to Collingwood and Sir Ralph Abercromby in St. Paul's Cathedral, and that of Mrs. Warren in Westminster Abbey; but subjects like these were far less congenial to him than sculpture of a more classical type, such as the pedimental figures over the portico of the British Museum, and his collossal nude statue of Achilles in bronze, set up in Hyde Park in honor of the duke of Wellington; this last statue, though possessing little originality of design, is not without grandeur, and shows a skilful treatment of the nude. Originality was not Westmacott's strong point, but he was highly trained, and, in spite of his artistically degraded time, possessed a strong natural good taste, which preserved him from reproducing the meretricious feebleness of his master Canova. Westmacott wrote the article SCULPTURE for the 8th edition of the *Encyclopædia Britannica*. He died September 1, 1856, after about fifteen years of retirement from active work.[1]

WESTMEATH, an inland county of Ireland, in the province of Leinster, is bounded N.W. by Longford, N. by Cavan, N.E. and E. by Meath, S. by King's County, and W. by Roscommon. Its greatest length from east to west is about 40 miles, and its greatest breadth from north to south about 35 miles. The total area is 453,453 acres, or about 708 square miles. Westmeath is included within the great central limestone plain of Ireland, but at Moat-a-Genogue and near Ballymahon the sandstone rises above the limestone bed and forms isolated protuberances. The general average height of the surface of the county is over 250 feet above sea-level. Being diversified with hill, valley, lake, and river it is highly picturesque, but in no part can it be termed mountainous, the highest summits being Knocklayde (795 feet), Hill of Ben (710 feet), and Knockayon (707 feet). Good limestone is obtainable for building or agricultural purposes, but in some cases the limestone is difficult to calcine. Copper, lead, coal, and marble have been dug, but are not found in sufficient quantities to make the speculation profitable. In some parts there are numerous eskers of calcareous gravel. A large surface is occupied by bog. A special feature of Westmeath is the number of large loughs, which have a combined area of nearly 17,000 acres. In the north, on the borders of Cavan, is Lough Sheelin, with a length of 5 miles and an average breadth of between 2 and 3 miles, and adjoining it is the smaller Lough Kinale. In the centre of the county there is a group of large loughs, of which Lough Dereveragh has an area of 2555 acres. To the north of it are Loughs Lene, Glore, Bawn, and others, and to the south Loughs Iron and Owel. Farther south is Lough Ennell or Belvidere, and in the southwest Lough Ree, forming part of the boundary with Roscommon. The river Inny, which rises in Cavan, enters Westmeath from Lough Sheelin, and, forming for parts of its course the boundary with Longford, falls into Lough Ree. The Inny has as one of its tributaries the Glore, flowing from Lough Lene through Lough Glore, a considerable part of its course

---

[1] [His son Richard (1799–1872), sculptor of "David as the Slayer of Goliath" and of the "Angel Watching" on the Ashburton monument, succeeded to the professorship of sculpture in the Royal Academy in 1857.—AM. ED.]

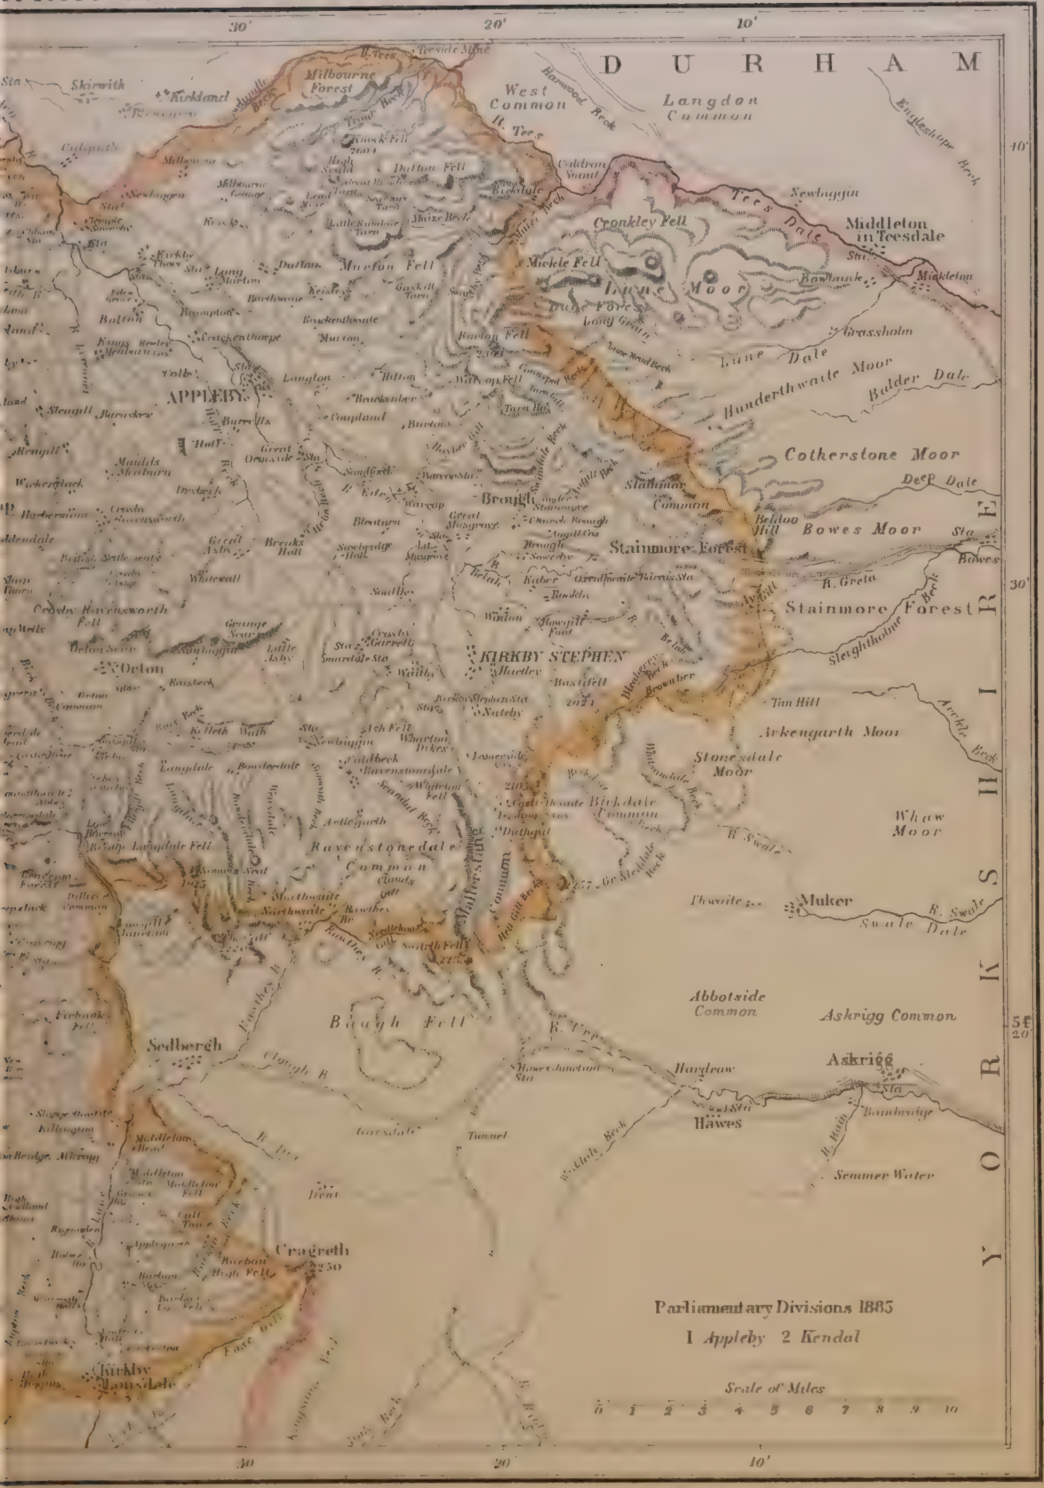
RLAND. PLATE XIII.



being underground. From Lough Lene the Dale also flows southwards to the Irish Sea, and thus this lake sends its waters to the opposite shores of the island. The Brosna flows from Lough Ennell southwards by King's County into the Shannon.

Agriculture.—According to the *Return of Owners of Land*, 1876, Westmeath was divided among 668 proprietors possessing 430,003 acres, at an annual value of £301,696 [$1,466,-242.56], or about 14s. [$3.40] an acre. There were also 4262 acres of common or waste lands. Of the proprietors only 111 possessed less than one acre. The following possessed over 8000 acres: earl of Longford, 15,014; John Malone, 12,555; Lord Castlemaine, 11,445; Lord Greville, 9784; Captain Thomas Smyth, 9779; Patrick Edward Murphy, 9694; Sir Benjamin Chapman, Bart., 9517; G. A. Rochfort-Boyd, 9431; Charles Brinsley Marley, 9060; and Sir John Ennis, Bart., 8775. The soil is generally a rich loam of great depth resting on limestone, and is well adapted both for tillage and pasturage. Even the hills when not under tillage are clothed with a rich pasturage to their summits. In 1886 22.2 per cent. of the entire area was under crops, 62.3 per cent. under grass, .1 per cent. fallow, 1.8 per cent. woods and plantations, 9.4 per cent. bog and marsh, .1 per cent. barren mountain land, and 4.1 per cent. water, roads, etc. The total number of holdings in 1886 was 10,992, of which 42 were above 500 acres in extent, 281 between 200 and 500 acres, 535 between 100 and 200 acres, 1094 between 50 and 100 acres, 3589 between 15 and 50 acres, 2466 between 5 and 15 acres, 1698 between 1 and 5 acres, and 1287 not exceeding one acre. Within about the last forty years the area under crops has diminished nearly a third. In 1849 it was 130,913 acres, and in 1859 it was 122,684. Between 1876 and 1886 it has been fluctuating rather than decreasing; in the former year it was 98,959, and in the latter 96,287. Only in the area under meadow and clover has there been an increase: in 1849 it was 35,359 acres, and by 1859 it had increased to 41,535, by 1876 to 51,262, and by 1886 to 56,619. The decline in the area under green crops has not been marked: in 1876 the area was 21,369 acres, and in 1886 it was 19,292; but since 1849, when it was 76,-173 acres, the area under corn crops has declined more than two-thirds, and the decline has been continuous, the area in 1876 being 26,305 acres, and in 1886 only 20,375. More than half the area under green crops is occupied by potatoes (11,948 acres in 1876, and 11,106 acres in 1886), turnips occupying in these years respectively 6155 acres and 5362 acres, mangel-wurzel, etc., 1232 and 1129, and other green crops 2534 and 1695. The bulk of the area under corn crops has always been occupied by oats, but their area has declined from 59,424 acres in 1849 to 25,709 in 1876, and 19,969 in 1886. The areas under other corn crops are inconsiderable. The number of horses in 1886 was 13,014, of which 883 were kept for amusement and recreation. Mules numbered 659, and asses 4391. Cattle numbered 102,878, 15,806 of them milch cows, and 45,915 other cattle above two years of age. The number of sheep was 118,401, of which 44,265 were under one year old. Pigs numbered only 17,303, goats 6811, and poultry 265,759, including 21,014 turkeys and 36,908 geese.

Manufactures.—The occupations are almost wholly agricultural, dairy farming predominating. Flour and meal are largely made. The only textile manufactures are those of friezes, flannels, and coarse linens for home use. The only mineral of any value is limestone.

Administration and Population.—De Burgo in 1760 placed the population at 50,340; in the parliamentary census of 1812 it was given as 112,000; in 1821 it amounted to 128,-819, in 1841 to 141,300, in 1861 to 90,879, and in 1881 to 71,-798 (males 36,478, females 35,320). Between 1841 and 1881 the decrease has thus been 49.18 per cent. Roman Catholics in 1881 numbered 92.2 per cent. of the population, and Protestant Episcopalians 6.9. In 1881 54 per cent. of the population could read and write, 14.7 per cent. could read but could not write, and 31.3 per cent, could neither read nor write,—14.8 per cent. being under seven years of age. There were none who could speak Irish only; 828 could speak Irish and English. By the Act of 1885 Westmeath, which formerly returned two members to Parliament, was formed into two parliamentary divisions, North and South, each returning one member; and, Athlone having been disfranchised, that part of the borough within the county was included in the South Division. The principal towns are Athlone, of which about half (3072 inhabitants out of 6755) is within the county, the remainder being in Roscommon, and Mullingar (4787), the county town, a Catholic cathedral city, and an important railway junction. The county is divided into 12 baronies, and contains 63 parishes and 1356 townlands. It is in the home circuit, and assizes are held at Mullingar, and quarter sessions at Mullingar and Moate. There are 16 petty session districts. The county is within the Dublin military district, and forms part of No. 67 sub-district, the brigade depôt of which is at Birr. There is a barrack station at Mullingar.

History and Antiquities.—Westmeath was included in the kingdom of Meath formed by Tuathal, overlord of the Scoti (*ob. cir.* 160 A.D.), to serve as his mensal land. The district suffered much in the 10th and 11th centuries from the Danes, who burnt the town and abbey of Fore. In 1153 the northern region was the scene of a bloody battle under the leadership of the two sons of Dermod O'Brien, after which Turlough, having obtained the victory, put out his brother's eyes. On the settlement of the English in Leinster it formed part of the palatinate of Hugh de Lacy, who received about 800,000 acres from the king, and allotted large tracts to his followers. In the reign of Henry VIII. the palatinate was divided into two parts, the western of which was distinguished by the name of Westmeath. In the latter division a portion of Longford was included until this district was formed into a separate county by Elizabeth. The plan for the insurrection of 1641 was concerted in the abbey of Multifarnham, and both in the wars of this period and those of 1688 the gentry of the county were so deeply implicated that the majority of the estates were confiscated. There are a considerable number of old raths: one at Rathconrath is of great extent; another at Ballymore, originally a Danish fort, was fortified during the wars of the Cromwellian period and those of 1688, and afterwards was the headquarters of General Ginckell, when preparing to besiege Athlone; and there is a third of considerable size near Lough Lene. The ruins of the Franciscan abbey of Multifarnham, founded in 1236 by William Delaware, picturesquely situated near Lough Dareveragh, include a tower 93 feet in height. Others of less importance are at Fore, Kilmocahill, and Kilbeggan.

WESTMINSTER. See LONDON.

WESTMORLAND, a northern inland county of England, adjoins Cumberland on the northwest, Lancashire on the southwest and south, Yorkshire on the east, and a small part of Durham on the extreme northeast. In form it may be regarded as an irregular polygon, with two large re-entering angles on the southwest and southeast. Its length from N.E. to S.W. is 42 miles, while from east to west it measures 40 miles. The total area is 505,864 acres, whereof 4958 acres are foreshore, and 8519 are water. No part of the county touches the sea, unless the estuary of the Kent be regarded as such.

Plate XIII.

Physically the county may be roughly divided into four areas. (1) The great upland tract in the northeastern part, bordering on the western margin of Yorkshire and part of Durham, consists mainly of a wild moorland area, rising to elevations of 2780 feet in Dun Fell, 2803 in Dufton Fell, 2591 feet in Mickle Fell, 2008 Nine Standards, 2328 High Seat, 2323 Wilbert Fell, and Swarth Fell 2235 feet above the sea. (2) The second area comprises about a third of the massif of the Lake District proper, with its eastward continuation, the Langdale and Ravenstonedale Fells, and also the fells of Middleton and Barbon farther south. These include Helvellyn (3118 feet), Bow Fell (2959), Pike Blisca (2304), Langdale Pike (2300), High Street (2663), Fairfield (2950), the Calf (2220), besides others of considerable elevation. All but the lower parts of the valleys within these two areas lie at or above 1000 feet above Ordnance datum; and more than half the remainder lies between that elevation and 1750 feet, the main mass of high land lying in the area first mentioned. (3) The third area includes the comparatively low country between the northern slopes of that just described and the edge of the uplands to the northeast thereof. This includes the so-called Vale of Edĕn. About three-fifths of this area lies between the 500 and the 1000 feet contour. (4) The Kendal area consists mainly of undulating lowlands, varied by hills ranging in only a few cases up to 1000 feet. More than half this area lies below the 500-feet contour. Westmorland may thus be said to be divided in the middle by uplands ranging in a general southeasterly direction, and to be bordered all along its eastern side by the elevated moorlands of the Pennine chain. The principal rivers are—in the northern area the higher part of the Tees, the Eden with its main tributaries, the Lowther and the Eamont, and in the southern area the Lune and the Kent, with their numerous tributary becks and gills. The lakes include Ullswater (the greater part), Windermere (the whole), Grasmere, Hawes Water, and numerous smaller lakes and tarns, which are chiefly confined to the northwestern parts of the county. Amongst the other physical features of more or less interest are numerous crags and scars, chiefly in the neighborhood of the lakes; others are Mallerstang Edge, Helbeck, above Brough; Haikable, or High Cup Gill, near Appleby; Orton Scars; and the limestone crags west of Kirkby Lonsdale. Amongst the waterfalls are Caldron Snout, on the northern confines of the county, flowing over the Whin Sill, and Stock Gill Force, Rydal Force, Colwith Force, and Dungeon Gill Force, all situated amongst the volcanic rocks in the west. Hell Gill, near the head of the Eden, and Stenkrith, near Kirkby Stephen, are conspicuous examples of natural arches eroded by the streams flowing through them. Amongst the more striking hills outside the massif of the Lake District are Wilbert Fell, Roman Fell, Murton Pike (1949 feet), Dufton Pike, (1578 feet), and Knock Pike (1306 feet).

Geology.—The geological formations represented in Westmorland are: (A) (1) recent deposits, and (2) glacial drift; (B) New Red rocks—(1) Upper New Red, and (2) Lower New Red or Permian; (C) Carboniferous rocks—(1) Coal-Measures and Millstone Grit, (2) Yoredale Rocks and Mountain Limestone, including the Roman Fell beds, Calciferous Sandstones, and the Lower Limestone Shale, and (3) the Upper Old Red; (D) Siluro-Cambrian rocks—(1) Silurian rocks proper, (2) Upper Cambrian, Ordovician or Lower Silurian rocks, and (3) Cambrian rocks; (E) Metamorphic rocks of different ages; and (F) various Plutonic rocks.

Alluvium in some form or another occurs as marginal deposits alongside streams, or as deltas where streams enter lakes, or where they spread at the foot of a hill-side. Peat forms a mantle of varying thickness on the damper or the more shady parts of nearly all the uplands, ranging locally up to a thickness of ten feet, and occurs on the sites of old tarns or of old swamps. Screes of rock waste are of general occurrence about the lower parts of nearly all the crags, and as such they play an important part in the scenery of the district. Glacial deposits, in the form of boulder clay, of sand and gravel, or of boulders, are extensively distributed over the lowlands, and to a variable distance up the hillsides also. They seldom much exceed 100 feet in thickness; but their occurrence is of considerable importance in relation to the scenery, and still more so to the character of the subsoil. Boulders of various kinds are scattered far and wide over nearly all but the highest parts of the county.

Between the period represented by the boulder clay and the next older deposit in Westmorland a great hiatus exists, which is elsewhere represented by several very important geological formations. Here the newest rock next in the series is the St. Bees Sandstone and the gypseous shales at its base, which together probably represent the Bunter series. These soft red sandstones, flags, and marls with gypsum are all confined to the northern part of the county, where they form much of the low ground extending along the foot of the Cross Fell escarpment from the county boundary east of Penrith southeastward to Kirkby Stephen. Some of the prettiest scenery of these parts (Crowdundle Beck; Mill Beck, Dufton; and Podgill, Kirkby Stephen) owes its character to these rocks. The stone is used extensively for building. Gypsum occurs in workable quantities in the shales near the base. Where fully developed these rocks are not less than 2000 feet in thickness. The next formations in descending order consist of the Magnesian Limestone (0-30 feet), the Helton Plant Beds (0-40 feet), the Penrith Sandstone and its horizontal equivalents the Brockrams (0-1200 feet). All these are older than the rocks previously mentioned, but belong to the same series. They occur in the same tract of country.

The highest rocks of the Carboniferous age in Westmorland are represented by a tiny patch of true Coal-Measures, let down, and so preserved from denudation, by one of the great Pennine faults, between Brough and Barras, in northeastern Westmorland. These rocks consist of several thick and valuable seams of coal, and of beds of fire-clay equally valuable, interbedded with several hundred feet of the usual sandstones and shales.[1] True Coal-Measures are not yet known to occur elsewhere in Westmorland. Millstone Grit of the ordinary type underlies these Coal-Measures, and is seen to perhaps a thickness of nearly 2000 feet. Except a small patch exposed near Appleby, and also another near Kirkby Lonsdale, the remainder of the Millstone Grit is confined to the higher parts of the wild moorlands along the eastern border of the county. The highest member of the second subdivision of the Carboniferous is the Yoredale Rocks, which form the chief mass of the hills forming the Westmorland part of the great central watershed of northern England. Most of the Cross Fell escarpment, of Stainmoor, and of the higher parts of the valley of the Eden consist of these rocks, as do also much of the lowlands. They consist essentially of a series of thin beds of limestone, parted by variable thicknesses of sandstone and shales, with here and there a thin coal-seam. Their thickness ranges from 1500 to 2500 feet. The Borradale coal-seam, and the Tan Hill seam, in these rocks, have long been worked for local purposes. Below the Yoredale Rocks limestone preponderates, and the gray limestones of this series form very conspicuous and striking features in the landscape around Kendal, Beetham, and Farleton; Kirkby Stephen, Orton, and Shap; Brough, Helgill, and Murton, and thence northwestward. Near Kirkby Stephen is nearly 2000 feet of this limestone, locally almost undivided. Near Kendal, at Barbon, between Ravenstonedale and Shap Wells, and near Helton occur masses of red gravelly conglomerate and red sandstones belonging to the Upper Old Red. The materials of the conglomerate largely consist of rocks foreign to the district. For a period of immense length preceding the deposition of the Upper Old Red the older rocks of Westmorland seem to have been exposed to a complicated series of disturbances and denudations, with, as a result, the removal from some areas of a thickness of strata above (rather than below) 5 miles in thickness. It was across the upturned and denuded ends of this vast pile of rock that the Upper Old Red was laid down. The older strata, grouped under D above, are therefore separated from the Upper Old Red by an unconformity representing the removal from this area, and the accumulation in some unknown area elsewhere, of a pile of rock 5 miles in thickness. This is one of the greatest breaks yet made known in the whole of the geological record.

The Siluro-Cambrian rocks are perhaps more fully developed in Westmorland and Cumberland than they are anywhere else—the aggregate thickness of strata referable to one or other of the horizons in this group being at least 6 miles. The highest member of this series is the Kirkby Moor Flags, which consist of a considerable thickness of mudstones and sandstones, much disturbed and contorted in places, and form the whole of the low hill country on the east side of the turnpike road between Kendal and Kirkby Lonsdale, and extending thence eastward to a little beyond the Lune. Lithologically and palæontologically these rocks agree in a general way with the Ludlow rocks of Shropshire. Their highest beds are unconformable to the Upper Old Red, sometimes violently so. These rocks graduate downward into the Bannisdale Slates, 5200 feet of close alternations of flaggy grits and rudely cleaved sandy mudstones. These rocks occupy a large area around Kendal, and to the southwest of that town. They also form a large part of the Howgill Fells. These in turn graduate downward into the Coniston Grits and Flags, which consist of 7000 feet of alternations of tough micaceous grits and rudely cleaved mudstones—the whole mass tending near its base to pass into finely striped and cleaved mudstones, the Coniston Flags. The tough and durable nature of the harder beds of this series gives rise to a series of mammillated hills. All the rocks of the series here referred to give rise to a type of scenery different in many essential respects from that resulting from the waste of any other rocks in Westmorland, so that the hill scenery south of a line joining Ambleside and Shap Wells is distinctly different from that to the north of that line. Near their base the argillaceous members of the series graduate downwards into a few hundred feet of pale gray-green mudstone, with a peculiar porcellanous texture; and these, in their turn, graduate downwards into a small thickness of pitch-black mudstones, with much the general character of indurated fuller's earth, and usually crowded with graptolites having the general facies of those elsewhere found in the Llandeilo rocks. The pale gray beds are the Stockdale Beds, or "pale slates." The Graptolitic Mudstones locally have at their base a conglomerate, which consists of rolled fragments of rocks from various horizons in the older series. In general terms these two groups of rocks may be described as occurring along a narrow outcrop extending from near Ambleside to Shap Wells. They reappear also near Dufton and at Cautla. In Westmorland the Llandovery beds of Wales appear to be absent, as the rocks next older than the Graptolitic Mudstones consist of rocks characterized by fossils of an unmistakably Bala type. The Westmorland type of these rocks consist of a mass of alternations of volcanic tuffs and lavas, with the marine equivalents of these, and with limestones and shales, the whole series thinning as it is traced toward the centre of the Lake District near the head of Wintermere. The Coniston Limestone is the best known member of this series. The series as a whole, however, finds its best and most fully-developed representatives outside the area of old subaerial volcanic cones and craters on whose surface the Coniston Limestone lies. The calcareous members of this series are usually replete with well-preserved fossils in great variety. The series under notice forms some conspicuous features along the foot of the Cross Fell escarpment. Rising from beneath these series just mentioned comes the vast pile of old volcanic ejectamenta, largely subaerial in the typical district, which is known as the Borradale Volcanic Series (see CUMBERLAND). Outside the massif of the Lake District we meet with the submarine equivalents of these subaerial accumulations. These are well seen at Milburn. They consist of many thousands of feet of alternations of submarine tuffs, with shales and mudstones, seemingly identical in character with the Skiddaw Slates, which in the centre of the Lake District mainly lie at the base of the volcanic rocks. The next type may be described as a vast pile of old marine sedimentary accumulations, ten or more thousand feet in total thickness, and mainly consisting of alternations of indurated shales, mudstones, and flags, with subordinate beds of grit. This is the Skiddaw Slate, which may be conveniently examined on and around Murton Pike, near Appleby. The same general type of strata prevails over a very wide area. The bottom of these rocks has never been reached. The principal areas of metamorphic rocks in Westmorland are situated in the volcanic area. Rocks more or less altered by deep-seated action occur also around the Shap Granite. The alteration of the volcanic rocks here takes the form of an approach to the mineral characters of granite; but there is no passage from the one to the other. The sedimentary rocks are altered also, more or less, but in a different way: the calcareous beds are developed into idocrase rocks, the cleavage in the Coniston Flags is sealed or welded up anew, while the grits are rendered more or less quartzitic.

---

[1] These will be found described in detail in the *Trans. Cumb. and West. Assoc.*, part vii. pp. 163-177.

Amongst the plutonic rocks the chief is the well-known granitic porphyry, fragments of which occur in the Upper Old Red near Shap. There are many intrudes of diorite, gabbro, felsite, mica trap, and the like,—all Post-Silurian and Pre-Carboniferous in age. Another well-known plutonic rock, of later date than the Carboniferous period, is the Whin Sill, an intrusive sheet of dolerite, which has eaten its way into the Carboniferous rocks over hundreds of square miles in the north of England. It forms the most characteristic feature of the sombre and gloomy fell-side recess known as "High Cup Gill," or Haikable, near Appleby; and it also forms the waterfall known as Caldron Snout. It is the newest intrusive rock known in Westmorland.

The whole county is traversed in many directions by great numbers of faults. One set, the Pennine faults, call for a brief notice here. Two lines of disturbance continued northward from the Craven faults enter the county east of Kirkby Lonsdale. One ranges north-northeastwards, on the east of the Barbon Fells, and lets in the Carboniferous rocks forming Gragreth, throwing down about 2000 feet on the east; it ranges by Dent, and east of Sedbergh, entering the county again in the valley between Clouds and the Ravenstonedale Fells. Here its effects are as strikingly exhibited as at Gragreth, as the Millstone Grit summit of Wilbert Fell on one side of the fault is let down to the same level as the summits of the Silurian hills on the other. The second set of faults referred to throws down in the opposite direction, letting down the Millstone Grit, the Yoredale Rocks, the Mountain Limestone, and finally, as its throw diminishes, the Old Red, against the foot of the Silurian massif of the Barbon Fells. This fault ranges parallel to the general course of the Lune nearly as far northward as Sedbergh, where it is joined by another set ranging east-northeast, which joins the set first described as ranging north-northeast to Ravenstonedale at a point near the county boundary north of Cautla. Thence the conjoined faults run northward in a very complex manner, producing some important effects upon the scenery about the foot of Mallerstang. Near Kirkby Stephen its throw changes from a downthrow to the east to one in the opposite direction, which throw increases rapidly in amount as the faults trend northwards, until at the foot of Stainmoor, below Barras, its throw amounts to quite 6000 feet down to the west; and we find the important patch of Coal-Measures above noticed let down in consequence. At this point it changes in direction, running northwesterly, with many complications, past Brough, Helton, Dufton, and Milburn, out of the county at the foot of Cross Fell. Along this line it throws down to the southwest several thousands of feet; and it is to the complicated disturbances accompanying this great dislocation that nearly the whole of the more striking physical features of North Westmorland owe their origin. It is in connection with the same important sets of disturbances also that the existence of most of the mineral veins of the district is due.

Climate.—The rainfall is exceptionally heavy. The largest quantity recorded appears to be that in the mountains along the county boundary west of Grasmere, where the mean amounts to as much as 140 inches. At Sty Head the rainfall in 1872 amounted to 243.98 inches. The area of greatest rainfall forms a rude ellipsoid around these two places, lying with its longest dimensions towards the southeast, nearly coinciding with the distribution of land above 1500 feet. The heaviest precipitation takes place in the months of January, September, and October, and the smallest in July. At Grasmere, well in the heart of the mountains, but farther east, and at a much lower elevation, the mean rainfall for the past twenty years has been 80 inches, rain of .01 inch or more falling on about 210 days of the year. Between Grasmere and Shap the rainfall diminishes somewhat in the mountain areas. But in the lower ground still farther east the rainfall steadily but more rapidly diminishes, until at Milburn (644 feet) the mean for the last ten years has been about 33 inches on 175 days in the year. At Kendal the mean appears to be about 50 inches, and the number of wet days about 190 in the year; at Kirkby Lonsdale it is rather less, and at Kirkby Stephen less again. The mean temperature for January is between 38° and 39° F., February 40°–41°, March 41°–42°, April 46°–47°, May 51°, June 58°, July 60°–61°, August 60°, September 56°, October 49°, November 42°, and December 38°–40°. The principal characteristic of the climate is the preponderance of cloudy, wet, and cold days, especially in the spring and the autumn,—combining to retard the growth of vegetation. The late stay of cold winds in the spring has much to do with the same, especially in the lowlands extending along the foot of the Cross Fell escarpment from Brough northwestwards. Here, for weeks at a time, prevails a kind of cyclone revolving on a horizontal axis parallel to the escarpment,—the "helm-wind." The remarkable feature connected with it is that, when the wind is rushing furiously from the slopes of the escarpment in the direction of the low grounds, little movement of the air can be detected on the summit.

Flora and Fauna.—Among the denizens of the mountains are several plants distinctly alpine in character; and others, more or less boreal in their principal stations, are here found at nearly their southernmost point of distribution. Bog plants are also conspicuous in their variety, and include several forms of some rarity. The lichens, mosses, and ferns are well represented. Of trees the oak and the common elm do not seem quite at home anywhere except in the more sheltered nooks, and in parks and other cultivated places. But the place of the common elm is well supplied by the wych elm, which grows to great perfection. In place of the oak the sycamore is seen almost everywhere in the lower lands; and there are probably few parts of England where the ash thrives so well, or attains to so large dimensions. On the higher lands, up to the upper limit of woodland growth, the birch, the hazel, and the mountain ash, and, in limestone districts especially, the yew are the prevailing trees. The alder is abundant, and willows of various kinds occur. The upland character of the region affects also its fauna. The badger, the polecat, and perhaps even the wild cat are still met with in Westmorland. The lineal descendants of the wild red deer range over a carefully-preserved remnant of the primeval forest in more than one place. The raven, the peregrine, and the buzzard may still be seen, and the moors sustain a considerable variety of birds other than grouse. The whistle of the golden plover and the note of the curlew are intimately associated with the scenery of the moory uplands. In the lowlands the avifauna is characterized rather by the absence of many forms common in the south than by the presence of birds elsewhere rare. The ornithologist cannot, however, help being struck with the comparative abundance of the redstart, the woodwren, and the grasshopper warbler, none of them very common in other parts of England.

Minerals.—Coal, the most important mineral product, occurs in connection with the Carboniferous rocks, but most of the seams are thin and their quality is inferior, so that they have long ceased to have the industrial importance they once possessed. Fireclays of excellent quality and of unusual thickness occur with the coals at Argill, but have not hitherto been turned to industrial account. Amongst the building-stones those of the New Red certainly deserve the first rank. The warm tinted, easily-worked, and durable Penrith Sandstone furnishes one of the finest building-stones in the kingdom; while the associated Brockrams are in their own way hardly less valuable; and the same may be said of the St. Bees Sandstone, whence the materials used on so many of the larger public buildings of the northern part of the county have been derived. The Carboniferous rocks nearly everywhere furnish durable freestones and good flags. The Silurian rocks likewise yield building-stones, but somewhat difficult to work. Some of the thinner beds of Carboniferous sandstone are occasionally quarried for roofing purposes. The Coniston Flags are quarried at several places on the south side of the county; while in the northwestern parts cleaved beds of volcanic ash, belonging to the Borradale Series, have long furnished an ample supply of the well-known "green-slates." Amongst stones available for ornamental purposes the Shap granite-porphyry is undoubtedly the finest, as its choice for decorative purposes in our large cities has shown abundantly. In the way of marbles there are the bituminous limestones at the base of the Yoredale Rocks, and the encrinital limestones nearer their top, both much appreciated; while among limestones of different character there are the mottled and variegated limestones of several places in the neighborhood of Kendal in the southern and of Asby in the northern parts of the county. Well-chosen specimens of Brockram have a pleasing effect when polished. Gypsum is worked extensively in the New Red rocks in the neighborhood of Kirkby Thore and Temple Sowerby. Amongst the ores of the useful metals those of lead are of prime importance. The rich lodes of Greenside mines were until lately reckoned amongst the finest of their kind in the United Kingdom, and they have also supplied considerable quantities of silver, which has been extracted from the lead. These were worked in the volcanic rocks. Copper and zinc ores also occur in small quantities. Hæmatite has been discovered here and there at many points, especially where calcareous strata have been affected by infiltration from the New Red rocks.[1]

Agriculture.—According to the Agricultural Returns for 1887 the total extent of green crops was 10,232 acres; of corn crops, 19,124, whereof 17,320 were of oats, and only 469 of wheat, and 118 of rye; seed-grasses, 14,951; and 207,017 acres of permanent pasture. The total number of horses is given as 8547; of cows and heifers in milk or in calf, 24,097; of other cattle, 39,225; of sheep, 334,978; and of pigs, 4731. There were 59 holdings of less than an acre; 495 of from 1 to 5 acres; 792 of from 5 to 20; 819 of from 20 to 50; 790 of from 50 to 100; 641 from 100 to 300; 64 from 300 to 500; 31 from 500 to 1000; and 3 holdings of above 1000 acres. The total number of owners is stated in the *Return of Owners of Land*, 1873, as 4376; the extent of lands held by them was 335,160 acres, with a gross estimated rental of £442,320 [$2,149,675.20], while 114,282 acres were commons or waste land. Seven proprietors then owned more than 5000 acres each: earl of Lonsdale, 39,229; Sir H. J. Tuften, 16,094; marquis of Headfort, 12,851; Hon. Mary Howard, 8868; W. Wilson, 8690; G. E. Wilson, 7630; W. H. Wakefield, 5584. A large part of Westmorland was formerly in the hands of what are called "statesmen," whose holdings were usually of small extent, but were sufficient, with careful management, for the respectable maintenance of themselves and their families. The proportion of landowners of this class is now, however, comparatively small. The meadow-land yields grass of first-rate quality. Grass of inferior value characterizes the pasture-lands; while on the fell (or unenclosed) land, except in limestone areas, the herbage consists chiefly of the coarser kinds of grass, bents, and heather. These, however, furnish nourishment for the hardier breeds of sheep, which are pastured there in large numbers. It is from the sale of these, of their stock cattle, horses, and pigs, and of their dairy produce that the staple of the farmers' income is derived.

Manufactures.—The manufacturing industries, owing to the absence of any large supplies of native fuel, are not numerous. The principal is woollen manufacture in one form or another, and this is chiefly confined to the low country in and near Kendal. Bobbin-making, fulling, snuff-grinding, and several small industries are carried on at a profit, owing to the water-power available at so many points. Paper-making is also carried on.

Administration.—There are five lieutenancy subdivisions, and two police divisions. There are 109 civil parishes in the county. It is in the diocese of Carlisle; is in the York military district, and forms part of the northern circuit. There is one court of quarter sessions for the county, and five petty sessional divisions. The assizes are now held at Carlisle. The principal town is Kendal, which had in 1881 a population of 13,696. Other towns, all much less important as regards both size and population, are Appleby, Kirkby Lonsdale, Bowness, Kirkby Stephen, Ambleside, Shap, and Orton. The county sends two members to parliament, representing the northern (or Appleby) and the Southern (or Kendal) Divisions respectively.

Population.—According to the census of 1881 there were 64,191 inhabitants (31,515 males, 32,676 females), the decrease since 1871 being 819. The proportion of population to acreage is 1 person to 7.80 acres. The people of Westmorland may be described as a prevalently tall, wiry, long-armed, big handed, dark-gray-eyed, fresh-colored race. In disposition they are a cautious, reserved, staid, matter-of-fact, sober-minded, unemotional race, somewhat slow-witted, but not by any means dull, and are thrifty beyond measure. The general character of the dialects of Westmorland is that of a basis of Anglian speech, influenced to a certain extent by the speech current amongst the non-Anglian peoples of Strathclyde. This is overlain to a much greater though variable extent by the more decidedly Scandinavian forms of speech introduced at various periods between the 10th and the 12th centuries. Three well-marked dialects can be made out.

Antiquities and History.—Amongst the oldest monuments of Westmorland are the circular earthworks called King Arthur's Round Table and Maybrough, both close to Penrith. Barrows and tumuli are common in the wilder parts of the county, more especially along the limestone hills near Orton. Traces of earthworks, regarded as Celtic, occur near Crosby Ravensworth, and at a few other places. Rude stone circles and other structures of the same nature exist at several places between Ravenstonedale and Shap. Stone implements of the Neolithic type and implements of bronze have been found all over the county. Cup-marked stones have been noticed near Penrith. At Brough church was found a slab bearing an inscription variously regarded as Greek, or Celtic, or Scandinavian. Well-marked traces of the occupation of the county by the Romans exist in their roads, their camps, their altars, and their coins. Monuments of later date, prior to the reign of Rufus, are exceedingly rare, and are chiefly confined to objects of an ecclesiastical character, which mostly owe their preservation to their having been worked up as building material in some of the older churches. Good examples are to be found at Kirkby Stephen, Long Marton, Bongate, and other churches. Vestiges of late Norman work, rarely earlier than 12th century, are preserved in several of the churches, and in a few of the castles. In the case of the castles especially it is evident that their sites had been used as strongholds through a long succession of periods, extending in some cases far back into prehistoric times. From the 12th century downward each period of the history of Westmorland may be said to be fairly well represented. (J. G. G.)

WESTON-SUPER-MARE, a watering-place of Somerset, England, is situated at the northern extremity of Uphill Bay, a recess of the Bristol Channel, and on a branch of the Great Western Railway, 138½ miles from London, 20 southwest of Bristol, and 20 northwest of Wells. It is built partly on level ground near the shore, and partly on the slopes of Worlebury Hill, which aids in sheltering it from the north and east. On this account, as well as from its bracing and dry air, it has won considerable favor both as a winter residence and as a summer resort. Many villas have been built in it by persons engaged in business in Bristol. An esplanade about 3 miles in length has been constructed at a cost of £30,000 [$145,800]. The pier, which altogether is 1040 feet in length, and includes the rocky island of Birnbeck, is north from the town at the extreme end of Worlebury Hill, where also are the Prince Consort promenade gardens. The church of St. John, built in 1824, mostly on the site of the old one, contains some old monuments. The other principal public buildings are the town-hall in the Venetian style, the assembly rooms, the market-house, the Weston county club, the church institute, the hospital and dispensary, and the West of England sanatorium, which since its enlargement in 1882 contains 100 beds. The town has been long famed for its potteries. The population of the urban sanitary district (area 2770 acres) in 1871 was 10,568, and in 1881 it was 12,884.

---

[1] For other minerals of Westmorland, the interest of which is chiefly scientific, see *Trans. Cumb. and West. Assoc.*, Nos. 7, 8, and 9.

The town was included in an ancient British settlement, of which Worlebury Hill was the citadel. The ramparts of this fortress still remain, including a number of hut circles, beneath which skeletons and Celtic remains have been found. In Domesday Westone is described as held by the bishop. In the time of Edward the Confessor it was held by Algar. In 1696 it was purchased by the Pigotts, the present lords of the manor. The growth of the town is entirely modern. About the beginning of the century it consisted of about twenty-four cottages inhabited by fishermen. A hotel for the reception of visitors was erected in 1805, and an esplanade begun in 1825, since which time it has made rapid progress.

WESTPHALIA (Germ. *Westfalen*), a province in the west of Prussia, is bounded on the N. by the province of Hanover, on the E. by the province of Hanover, the principalities of Lippe-Detmold and Schaumburg-Lippe, the duchy of Brunswick, the province of Hesse, and the principality of Waldeck, on the S.W. by Rhenish Prussia, and on the N.W. by Holland. Its greatest length from north to south is 110 miles, its greatest breadth is 124 miles, and its total area is 7800 square miles.

The Lippe, an affluent of the Rhine, flowing from east to west across the province, divides it into two parts, dissimilar in their character. The northern portion, a continuation of the plain of the Netherlands, is flat, with the exception of the east, which is occupied by the Weser Hills. South of the Lippe, on the other hand, the province is occupied by numerous small chains and groups of hills, enclosing many beautiful valleys. Between the parallel courses of the Lippe and Ruhr stretches the low chain of the Haar or Haarstrang (850–1050 feet), which is steep on its southern face, but slopes gradually down on the north to the valley of the Lippe, known as the Hellweg. The rugged mountain district south of the Ruhr is known as the Sauerland, and its eastern portion, the plateau of Winterberg, is the highest part of the province. The culminating point is the Astenberg (2760 feet). This plateau is connected with the Westerwald on the southwest border by the Rothhaar or Rothlagergebirge. Westphalia is divided between the basins of the Rhine, Ems, and Weser. The Rhine itself does not touch Westphalia; but its affluents, the Lippe and Ruhr, are the leading streams in the province. The Ems, entering Westphalia from Lippe, flows northwest and enters Hanover. The Weser crosses the northeast of the province, piercing the Weser Hills by means of the narrow pass known as the Porta Westphalica or Westphalian Gate. All these streams are navigable for barges and small vessels. There are no lakes in the province. The climate is on the whole temperate, though sometimes the winters are severe among the mountains.

About 42 per cent. of the surface is given up to agriculture, 25 per cent. to pastures and moors; 28 per cent. is under wood; and the remainder is unproductive. The fertility of the soil varies; it is most unfertile in the north and northeast. A great proportion of the land is in the hands of small farmers and peasant proprietors, who as a class are well-to-do, though their system of farming is in some respects antiquated. Grain of various kinds is grown, though not in sufficient quantity to meet the demands of the province; potatoes, pease and beans, fruit, and tobacco are also produced; but perhaps the most important crops are hemp and flax, which places Westphalia among the leading flax-producing districts of Germany. The forests are chiefly on the mountains of the Sauerland, and in the south generally. Considerable numbers of cattle and pigs are reared, the latter yielding the well-known Westphalian hams; goats are also numerous in some districts; and Government pays some attention to the breeding of horses in this province. Sheep are comparatively few. (Compare the agricultural statistics under PRUSSIA.)

In virtue of its abundant coal and iron Westphalia is one of the busiest industrial quarters of Germany. There are coal-fields in the north and in other districts, and the great coal-field of the Ruhr extends into the province. The district of Arnsberg, occupying the south of the province, is the centre of the mineral industry. Dortmund gives name to one of the five mining districts into which Prussia is officially divided. Westphalia produces more iron ore than any other province in Prussia except the Rhine province and Silesia; next to Silesia it produces the most zinc, and next to Saxony the most copper; and it yields more sulphur than any other province. Argentiferous lead, antimony, limestone, gypsum, marble, and slates are also worked. There are seven salt-works and numerous mineral springs.

The mineral wealth of the province encourages an extensive manufacturing industry, the leading branches of which are linen-weaving and iron-working. The linen industry is very ancient, and since the 14th century has flourished in this province between the Lippe and Weser. Its chief centre is now Bielefeld, which also manufactures jute. The cotton factories of Münster are important. Woollens, stockings, and ribbons are also manufactured to some extent. The principal seats of the metallic industries are Iserlohn, Lüdenscheid, Altena, Hagen, and the "Enneper Strasse," a valley 7 miles long and three quarters of a mile wide, lying along the Ennepe and containing as its chief towns Haspe (7318 inhabitants) and Gevelsberg (7055). Cast and wrought iron, steel, rails, wire, blades and tools, machinery and small iron and steel goods, bronze, brass, and plated articles are among the leading products. Vitriol, glass, and paper are also made. An active trade is carried on in the manufactured goods, and in timber, hams and sausages. The leading commercial towns are Bielefeld, Iserlohn and Dortmund. Minden has a port on the Weser; Beverungen is the centre of the corn trade; and Paderborn is the chief wool-market. The roads are good, and the railways numerous and convenient.

The population in 1885 was 2,202,726, or 282 per square mile. About 52 per cent. are Roman Catholics, most of whom are found in the southern district of Arnsberg. About 46½ per cent. are Protestants, the remainder are Jews and others. Education is well attended to. The seat of government is at Münster; and the province is divided into the three districts of Minden, Münster, and Arnsberg. It has thirty-one members in the Prussian parliament, and seventeen in the imperial diet.

Westphalia was the name given to the western portion of the early duchy of SAXONY (vol. xxi. pp. 366–367). When Henry the Lion fell under the ban of the empire his Saxon domains were distributed by the emperor. The Sauerland and some other parts of Westphalia fell to the archbishops of Cologne, who afterwards received from Frederick Barbarossa the title of dukes of Westphalia and Angria. The northern portion of the original Westphalia became the nucleus of the circle of Westphalia in Maximilian's administrative organization of the empire, while the duchy of Westphalia, as an appanage of Cologne, was included in the scattered circle of the Lower Rhine. The circle of Westphalia embraced, roughly speaking, what is now Oldenburg, Hanover to the west of the Weser, the districts of Münster and Minden, and a few other territories, an area of about 27,000 square miles, which in Maximilian's time was divided among four bishoprics and innumerable small secular states with an aggregate population of about 3,000,000. The peace of Lunéville in 1801 transferred all parts of this circle west of the Rhine to France, while in 1803 the duchy of Westphalia was granted to the duke of Hesse-Nassau as compensation for his former possessions to the west of the Rhine, which had also been added to France.

In 1807 Napoleon constituted the kingdom of Westphalia and gave it to his youngest brother Jerome. It comprised all the Prussian provinces as far east as the Elbe, and extended south to Fulda and the Thuringian states, embracing an area of about 14,880 square miles, with a population of 2,000,000. Nearly the whole of Hanover was added to this kingdom in 1810; but next year Napoleon again took away the greater part, as well as other territories, leaving, however, 17,740 square miles, with 2,057,000 inhabitants. This kingdom was intended to take the lead in the Confederation of the Rhine. After the battle of Leipsic in 1813 the kingdom of Westphalia was abolished, and things reverted to their previous order until the congress of Vienna rearranged the map of Europe, when Westphalia, as we now understand the term, was assigned to Prussia.

The peace of Westphalia, concluded in 1648 at Osnabrück and Münster, put an end to the Thirty Years' War (see GERMANY, vol. x. p. 449.)

WEST POINT, the seat of the United States military academy, on the Hudson, in Orange county, New York. See ARMY, vol. ii. p. 541.

WEST TROY, a village of Albany county, New York, United States, is situated in the bottom-land on the west bank of the Hudson, opposite Troy, with which it is connected by an iron bridge, and 5 miles north of Albany. It is at the termini of the Erie and Champlain Canals, and is on a railroad line of the Delaware and Hudson Canal Company. The village is well laid out, has water and gas, is provided with street cars, and has extensive manufactures of a varied character, but particularly of iron. The Watervliet (United States) arsenal is situated here. The population, 10,693 in 1870, was 8820 (2427 of foreign birth) in 1880.

Plate VII.

WEST VIRGINIA, one of the Northeastern Central States of the American Union, lying between 37° 6′ and 40° 38′ N. lat., is bounded on the N. by Pennsylvania and Maryland, on the E. and S. by Virginia, and on the W. by Kentucky and Ohio, and has an area of 24,780 square miles.

The form of the State is extremely irregular. It may be roughly likened to an ellipse, the greatest diameter of which lies nearly northeast and southwest. Its boundary upon the east and south is made up of the irregular line which limited the counties which were set off from Virginia for the formation of this State. Upon the west the boundary is low-water upon the further shore of the Big Sandy and Ohio rivers. A long narrow strip, known as the "Panhandle," projects northward some sixty miles along the Ohio,—the boundary being the continuation of the straight line which separates Ohio and Pennsylvania. To the east of this the northern boundary follows Mason and Dixon's line; then, dropping in a due south direction to the "Fairfax Stone," it follows thence easterly the course of the Potomac to its junction with the Shenandoah.

The entire state is mountainous or hilly, being comprised within the region known as the Cumberland or Alleghany plateau. The highest land in the State is upon the eastern and southern boundary, where the plateau in many places reaches elevations exceeding 4000 feet. Thence the country has a general slope to the northwest, and is lowest along the Ohio, where the elevation is but 600 to 800 feet. This plateau has been subjected to stream erosion until it has become a network of narrow crooked ridges with deep gorges or narrow valleys. The height of the ridges and the depth of the valleys, together with the ruggedness of the country, diminish towards the northwest, until near the Ohio the hills become rounded and softened in outline, and the valleys are broad and fertile.

The drainage system of the State is in some respects peculiar. Although the general slope is towards the northwest, the Potomac, which flows southeasterly to the Atlantic Ocean, has cut its way far back into the plateau, and drains, by means of numerous long branches, the northeastern quarter of the State. The remainder of the State is drained to the Ohio by means of several large branches which flow in a general northwesterly direction. Heading in the southwest is the Big Sandy, forming a portion of the State boundary. Fourteen miles above its mouth enters the Guyandotte, and 50 miles above the Guyandotte comes the Great Kanawha, one of the principal branches of the Ohio. This large and powerful stream has cut its way back beyond the crest-line of the plateau, tapping numerous streams in southwest Virginia and western North Carolina, so that its sources are now against the Blue Ridge in the latter State. It is known in North Carolina and Virginia, and in West Virginia to the Great Falls, by the name of New River. In West Virginia it has numerous large tributaries—the Big and Little Coal rivers, Piney, and Bluestone from the south, and the Pocotaligo, Elk, Gauley, and Greenbrier from the north. The next branch of the Ohio, proceeding northward, is the Little Kanawha, which empties into the Ohio at Parkersburg. The northwestern part of the State is drained by the Monongahela, one of the two head branches of the Ohio, and its tributaries, the principal of which are the Tygart's Valley, Cheat, and Buckhannon rivers. Of these streams the Ohio is navigable for river steamers at nearly all stages of water. The same may be said of the Kanawha to a point near the Kanawha Falls, while the Big Sandy, the Guyandotte, and the Monongahela are navigable for flat boats for long distances, and these, as well as numerous other streams, are largely used for the floating of lumber. All the streams of the State, and especially the smaller ones, have a rapid fall, but their enormous water-power has as yet been utilized only to a trifling extent.

Climate.

The climate is nowhere severe, although, owing to the range in elevation within the State, there is a considerable range in temperature. The mean annual temperature ranges from 54° to 55° F., being highest in the neighborhood of the Ohio, in the western part of the State, and lowest upon the high mountains in the eastern and northeastern portion. The maximum is rarely above 95° in any portion of the State, while the minimum occasionally reaches 10° in the more mountainous section. The rainfall may be given broadly at between 40 and 50 inches annually. It also varies with the elevation, being less in the lower portions and greatest upon the high mountains.

Fauna.

The fauna of the State is that common to the whole southern Appalachian region. Much of the area being as yet in a state of nature, deer of the white-tailed species are still abundant, and black bear are not unfrequently met with in the more rugged and remote portions. Wild turkeys are still found in some localities, and the mountains have long been a popular resort for hunters, while the streams, abounding in trout, afford an equally attractive field for the angler.

Timber.

The timber resources of the State are enormous, and a small proportion of its area, amounting to only about 25 per cent., has been cleared. The remainder is covered with virgin forest. This consists mainly of broad-leafed trees of the most valuable sorts for lumber, such as chestnut, black walnut, cherry, ash, poplar, hickory, locust, maple, oak, etc. Considerable areas of white pine are found in the highest portions of the plateau, being practically the only original forests of this wood left in the United States. Besides these there are considerable quantities of yellow pine, hemlock, spruce, and cedar scattered through the State.

Minerals.

Viewed broadly, the geological structure of West Virginia is extremely simple. Practically the entire State is overlaid by nearly horizontal beds of the Carboniferous formation. The coal of West Virginia forms its principal mineral wealth. It is estimated that of its entire area not less than 16,000 square miles are underlaid by workable beds of coal. The *Report* of the United States Geological Survey upon mineral resources defines the general boundaries of the coal-fields of the State as follows: "The eastern boundary begins at the south on the mountain range just east of the Bluestone River, and proceeds east to Little Sewell Mountain; . . . . . thence with the common boundary of Nicholas and Greenbrier and of Webster and Pocahontas counties to Rich Mountain in Randolph county; following this last-named ridge to Laurel Mountain, the dividing line between Upshur county on the west and Randolph and Barbour counties on the east, and thence with the Briery Mountain into Preston county, and so on to the Pennsylvania State line." All the area to the west of this line is underlain by coal. To the east of it there are small outlying patches, as in Greenbrier, Meadow Mountain, and possibly in Pocahontas, Tucker, Grant, and Mineral counties, but these are unimportant as compared with the vast areas in the west. In the gorge of every large stream flowing through this area are seen outcropping beds of coal, easily accessible to the miner, and requiring only facilities of transportation to render the mineral of commercial value. In the matter of coal production the State is rapidly acquiring prominence. From a production in 1873 of 600,000 tons, it reached in 1886 a production of over 4,000,000 tons, being exceeded by only four of the States, viz., Pennsylvania, Illinois, Ohio, and Iowa. The production is limited only by the demand, as the supply is almost inexhaustible. The coals of the State are of every variety except anthracite, and are noted for their purity for coking, steam, and gas purposes and for domestic fuel.

Iron ore is abundant in various portions of the State, but is worked only to a comparatively limited extent.

Mineral springs.

Salt springs are found in the valley of the Kanawha and in that of the Ohio, and there are extensive evaporating works in both these localities. The production, however, has been retarded by the competition of those in Michigan, owing to the greater cheapness of fuel and better facilities for transportation in the latter locality. The production of salt in West Virginia in 1886 amounted to 250,000 barrels. West Virginia contains numerous valuable mineral springs, among the best known of which are the Greenbrier White Sulphur springs in Greenbrier county, Capon springs in Hampshire county, Irondale springs in Preston county, and Red Sulphur springs and Salt Sulphur springs both in Monroe county. These are well-known and popular summer resorts in the mountains, and the waters from them are shipped to all parts of the United States.

Agriculture.

While the entire State may be said to be either mountainous or hilly, it contains a large extent of arable land. Nearly all of the lower hill country can be cultivated, while in the mountainous region there are numerous broad valleys of excellent soil, and everywhere the hill and mountain sides can be cultivated if the slope is not excessively steep. The tenth census (1880) reported an area of 10,193,779 acres of land in farms, of which 3,792,327 acres, or about one-fourth the area of the State, was improved land, this being mainly in the lower and less mountainous portion. The average size of farms was 163 acres, showing as compared with the average 10 years earlier, viz., 214 acres, a decided decrease. The value of farms and farming implements was very nearly $136,000,000. The numbers of live stock upon farms as distinguished from animals owned for business purposes in cities, consisted in January, 1888, of 138,231 horses, 6475 mules, 474,933 sheep, 432,778 hogs, 171,273 milch cows, and 780,892 other cattle,—showing that the live-stock interests of the State are very large. The estimated value of all farm products sold, consumed, or on hand, as returned in 1880, was $19,360,049. The principal agricultural products are wheat, Indian corn, hay, tobacco, oats, and garden vegetables. The cereal products for 1887 consisted of 12,516,000 bushels of corn, 2,840,000 of wheat, and 2,531,000 of oats.

Manufactures.

The manufactures, which are not extensive, are concentrated mainly at Wheeling, the largest city, on the Ohio, in the northern part of the State; they consist mainly of manufactures of iron and steel, glass, flouring and grist mill products, lumber, and leather. There were in 1880 2375 manufacturing establishments, employing a capital of $13,883,390 and 14,351 persons. The value of manufactured products was $22,867,126.

Railways.

There are 1200 miles of completed railroads, with several branches and one trunk line in process of construction. The Baltimore and Ohio Railroad traverses the State from Parkersburg and Bellaire on the Ohio, the two branches meeting at Grafton, and running thence eastward to Washington, Baltimore, and New York. The Newport News and Mississippi Valley Railroad runs across the State from the mouth of the Big Sandy on the west to the Alleghanies near White Sulphur springs, and thence extends to Richmond and Newport News. The Ohio River line runs from Wheeling to Huntington on the Ohio. The West Virginia Central extends from Piedmont on the Baltimore and Ohio line to a point in Randolph county, and is now in process of construction southwestward to intersect the Newport News and Mississippi Valley line. The Clarksburg and Weston, intersecting the Baltimore and Ohio at Clarksburg, extends to Weston in Lewis county, and this has two branches, one to Glenville in Gilmer county, and the other to Buckhannon in Upshur county. The Grafton and Greenbrier Railroad, intersecting the Baltimore and Ohio at Grafton, extends up the Valley river to Belington in Barbour county. The Norfolk and Western Railroad, one of the main trunk lines of the Atlantic States, has a part of its lines in the southern portion of West Virginia. Railway construction is exceedingly active in all parts of the State, several new lines and numerous branches of existing lines being under construction and in contemplation.

Education.

The State early in its history (December, 1863) adopted a liberal system of free schools. The plan is known as the township or district system,—the magisterial district or subdivison of each county being taken as the unit for taxation, and the general control of all the school interests of the district being placed in the hands of a district board of education elected by the people, and authorized among other duties to levy taxes, to determine the number of months of school and the number of subdistricts, to plant and build school-houses, and to manage the financial and other school interests of the districts. There is likewise in each county a superintendent, and in the State a general superintendent. This system has since been maintained and strengthened by legislative enactment till from 133 school-houses and 431 public schools of all grades in 1865 there were in 1887 4587 school-houses in the State. In 1865 the amount expended in support of free schools was $7722; this gradually increased till in 1887 the amount was $1,087,674. The number of teachers employed by public appropriation was 387 in 1865; in 1887 it was 5106. The estimated value of school-houses in the State, 140,000 in 1865, was 2,000,000 in 1887. The average attendance in 1865 was 44 days; in 1887 it was 108. The school system of the State is made permanent by the constitutional enactment referred to, which requires that the legislature shall provide by general law for a thorough and efficient system of free schools. The general school system involves the education of teachers, and with this object from 1867 to 1872 the legislature provided for the establishment of six normal schools, which are in successful operation. In these schools tuition is free to all who desire to prepare themselves for teaching. They are popular among the people, and have done much to elevate the general standard of education. They prescribe courses of three years; nearly all of them have preparatory courses; four of them give collegiate training, and in all of them the study of ancient and modern languages is optional. The school system involves also what is known as the irreducible school fund. The principal, which now amounts to $600,000, is permanently invested. This fund is constantly augmented from sources provided by law and by voluntary contributions.

Public institutions.

The United States Government has erected public buildings for its judicial, postal, and revenue departments within the State at Wheeling, Clarksburg, Parkersburg, and Charleston, the capital of the State. While WHEELING (*q.v.*) was temporarily the capital, a building was erected by its citizens for the uses of the State, which is now used for city purposes. The six normal schools already referred to have suitable buildings at Fairmont, Glenville, Huntington, Concord, Shepherdstown, and West Liberty. The hospital for the insane at Weston in Lewis county and a branch asylum in course of construction at Spencer in Roane county, a deaf-mute and blind asylum at Romney in Hampshire county, a penitentiary at Moundsville in Marshall county, and a university supported by the State at Morgantown in Monongalia county may be mentioned among the other public institutions of West Virginia.

Value of property.

The assessed valuation of real estate in 1887 amounted to $118,753,342, and that of personal property to $43,710,175; that of railroad property in 1880 was $4,497,030, and in 1887 $22,797,984. The State tax is 30 cents on each hundred dollars of valuation.

Liquor laws.

An amendment to the constitution is now pending, by which it is proposed to prohibit the sale or manufacture of intoxicating liquors. At present the laws of the State—and they have been enforced with more or less of modification almost since its foundation—involve the high license system. The granting of the license is based in all cases on good character, and is subject to the discretion of the county commissioners. Under the operation of these laws, and by virtue of local sentiment in its enforcement, no license has been granted (and hence in effect the traffic has been prohibited) in as many as 38 of the 54 counties. The license is subject to a tax fixed by the State law, and where sales are to be made in incorporated villages it is subject to an additional tax, which is fixed by the authorities of the incorporation.

Population.

In 1880 the population of the State was 618,457. That of the principal cities was—Wheeling, 30,737; Parkersburg, 6582; Martinsburg, 6335; Charleston (the State capital), 4192; Grafton, 3030; and Charlestown, 2016. The colored population numbered 25,886, the foreign-born population 18,265. The increase in population from 1870 to 1880 was 39.9 per cent. The proportion of native whites was 93 per cent. of the whole number of whites, which is larger than that of any other State in the Union. The popular vote at late elections indicates a population of 800,000, and that of Wheeling, Charleston, and Parkersburg is shown by local investigation to have very largely increased.

Administration.

The executive power is vested in a governor elected by the people for a term of four years, and ineligible under the constitution for re-election. There are also an auditor, a treasurer, an attorney-general, a secretary of state and State superintendent of free schools, who with the governor constitute a board of public works, and are likewise elected by the people for terms of four years, except the secretary of state and a librarian (who is *ex officio* adjutant-general), who are appointed by the governor. The legislative power is vested in a senate and house of delegates. The senate embraces 26 members, half of whom are elected every alternate two years, for a term of four years. The house of delegates consists of 66 members, who are elected every two years. The legislature meets biennially, and may be convened in extraordinary session by the governor, or by the concurrence of three-fifths of its members. The veto power is vested in the governor, but a majority concurring in each house of the legislature overrides it. The judiciary consists of a supreme court of appeals, with four judges, who in case of their equal division affirm the judgment of the lower court, and of circuit courts, with one judge each, exercising general original power and appellate jurisdiction over magistrates or justices of the peace, and of magistrates and justices of the peace, whose jurisdiction in civil cases is limited to $300, and who exercise criminal jurisdiction in petty offences, and may issue warrants of arrest and make preliminary examination and commit for trial in the circuit court in cases of crime. The fiscal regulations of the counties are confided to a board, consisting of three county commissioners. The county organization consists of these commissioners, a sheriff, deputy sheriffs, a circuit court clerk, a county clerk, who is recorder of deeds, wills, etc., board of education, school trustees, overseers of roads, a commissioner of school lands, an overseer of the poor, and a commissioner of accounts. All these except the deputy sheriffs, commissioner of accounts, commissioner of school lands, and overseer of the poor are elected by the people.

History.—The establishment of West Virginia as a State was consummated on 20th June, 1863. Its creation and admission were due to conditions which existed prior to the civil war of 1861–65, to popular sentiment which those conditions developed when the war was precipitated, and to the exigencies of the war itself. The Alleghany Mountains had divided the State of Virginia politically and commercially, and in the sentiment relating to her systems of taxation, revenue, and public expenditure into a Virginia and a "Western" Virginia, long before the civil conflict gave permanent result and fixed an official definition to the line of demarcation between them. Even after the war and the formation of the new State the title to two counties, Jefferson and Berkeley, "lying east of the mountains," was the subject of legislation and contention before the courts. They were in 1870 judicially declared by the supreme court of the United States to be a part of the State of West Virginia. The western part of Virginia was sparsely peopled, its great forests undeveloped, its vast mineral resources only partially realized, and its slave interests comparatively small. The eastern section contained the larger population, owned the great bulk of slave property, and exercised controlling power over State affairs. The Alleghanies, dividing the two sections, in the absence of transverse railroad facilities naturally sent the citizens of one side with the flow of their navigable waters to western and southern markets, while those of the other, moved by similar natural causes, turned to the seaboard for their commercial and business intercourse. The basis of taxation, the basis of representation, and the relation of the slave interests to these, with the measure and distribution of public funds for works of internal improvement and other questions of local concern, constituted elements of continual controversy, and served to detract largely from the homogeneity of the population. Early in January, 1861, the legislature of Virginia, in extra session, passed a bill calling a convention of the people to meet in the following month. At the same election the people were to vote on the question whether the separation of Virginia from the Union should be determined by the convention or be submitted by the convention to the people for ratification or rejection. The majority at the election in favor of submitting the question of secession to the people was overwhelming, and was construed as indicating the loyal sentiment of the people of northwestern Virginia. On the 17th of April, after the bombardment of Fort Sumter, the convention passed an ordinance of secession, and on the 24th a schedule submitting it to the people. The ordinance of secession was adopted by the people of Virginia, but the majority against it in the northwestern part of the State was very large. A convention of the unionist counties, which met at Wheeling in June, adopted an ordinance for the reorganization of the State government, and in August adopted an ordinance providing for the formation of a new State, to be named "Kanawha," comprising thirty-nine specified counties, and to include other counties also named, provided their vote should indicate such desire. Under this provision a number of counties were afterwards added to the original thirty-nine. At the time of the vote upon the proposition to form a new State war was raging throughout its proposed borders, and many of its counties had been the scene of violence and bloodshed. Many citizens were in the field as soldiers on the respective sides, and this fact, coupled with the general conditions, caused a small vote to be polled. Of this comparatively small vote, however, a large majority was for the new State, and members were elected to a constitutional convention. This convention met at Wheeling in November, and formed a constitution for the proposed new State, and designated it the State of West Virginia. This constitution was submitted to the people, and adopted by an overwhelming majority in April, 1862. In May the legislature of the "reorganized Government" of Virginia passed a bill to authorize the formation of the new State out of the territory of the old State of Virginia, as indicated by the recently ratified constitution, and in the same month this Act of the Legislature, accompanied by its memorial and a certified copy of the constitution and proceedings by which it had been adopted, was presented to Congress. The subject led to grave discussion in that body, but ultimately the proposed constitution was carried, with but one modification affecting the freedom of children of slaves thereafter to be born within the limits of the new State. A new constitution was adopted in 1872. The State of West Virginia being the result of a double revolution—that of the State of Virginia against the Federal Union and that of her northwestern counties against the seceding State of Virginia—its people are conservative and strikingly homogeneous. Even in the throes of revolution declaring separation from the mother State provision was made for the assumption of a just share of the old State debt, though its adjustment has never yet been reached. West Virginia has no other debt. Falling naturally, as did most of the border States, immediately after the war, into violent proscriptions of the returning Confederate element, West Virginia was one of the first of the States to modify and repeal these enactments. By the election of 1870 they were abrogated forever, and since that time the issues and consequences of war have so far disappeared as to leave no preceptible trace behind. (J. E. K.)

WETSTEIN, John Jacob (1693–1754), New Testament critic, was born at Basel, March 5, 1693. His father, John Rudolph Wetstein, was pastor of St. Leonard's in that city, and belonged to a learned family with wide ramifications. John Jacob studied the classics, Hebrew, and mathematics under distinguished professors, amongst whom was one of the Buxtorfs. Theology he studied under Samuel Werenfels, an influential anticipator of modern scientific theology and exegesis. While still a student he began to direct his attention to the special pursuit of his life—the text of the Greek New Testament. A relative, John Wetstein, who was the university librarian, gave him permission to examine and collate the principal MSS. of the New Testament in the library, and he copied the various readings which they contained into his copy of Gerard of Maestricht's edition of the Greek text. In 1713 in his public examination he defended a dissertation entitled *De Variis Novi Testamenti Lectionibus*, and sought to show that variety of readings did not detract from the authority of Sacred Scripture. Wetstein paid great attention also to Syriac and Talmudic Hebrew. In the spring of 1714 he undertook a learned tour, which led him to Paris and England, the great object of his inquiry everywhere being manuscripts of the New Testament. In Paris he examined the *Codex Ephraemi*, and on arriving in England in August, 1715, the *Codex Alexandrinus* and the *Codex Bezæ* with many others. Early the next year he made the acquaintance of Bentley at Cambridge, who took great interest in his textual inquiries. The great scholar induced him to return to Paris to collate for him more carefully the *Codex Ephraemi*, Bentley having then in view a critical edition of the New Testament. In July, 1717, Wetstein returned to Basel to take the office of a curate at large in his native city, a post which he held for three years, at the expiration of which he exchanged it to become his father's assistant in the parish of St. Leonard's. At the same time he pursued his favorite study, and lectured also in the university on New Testament exegesis. It was then that he formed the resolution to prepare a critical edition of the Greek New Testament. He had in the meantime broken with Bentley, whose famous *Proposals* appeared in 1720. Wetstein was not permitted, however, to pursue his purpose without molestation. The rumor got abroad that his projected text would take the Socinian side in the case of such passages as 1 Timothy iii. 16, and in other ways he gave occasion for the suspicion of heresy. At length in 1729 the charge of projecting an edition of the Greek Testament savoring of Socinianism was formally laid against him. The end of the long and unedifying trial was his dismissal, May 13, 1730, from his office of curate of St. Leonard's. He then removed from Basel to Amsterdam, where a relative, John Henry Wetstein, had an important printing and publishing business, from whose office excellent editions of the classics were issued, and also Gerard of Maestricht's edition of the Greek Testament. Previous to his removal from Basel Wetstein had commenced printing in this office an edition of the Greek Testament, which was suddenly stopped for some unknown reason. At his trial the first sheets of this edition were brought into court against him, though the new readings which had been adopted in his text were simply those which are now universally accepted. As soon as he reached Amsterdam he published anonymously the *Prolegomena*, which he had proposed should accompany his Greek Testament, and which was republished by him, with additions, as part of his great work in 1751. The next year (1731) the Remonstrants offered him the chair of philosophy in their college at Amsterdam, vacated by the illness of John Le Clerc, on condition that he should clear himself of the suspicion of heresy. He thereupon returned to Basel and procured a reversal (March 22, 1732) of the previous decision, and readmission to all his clerical offices. But, on his becoming candidate for the Hebrew chair at Basel, his orthodox opponents procured his defeat and his retirement to Amsterdam. Here the Remonstrants permitted him to hold lectures in their college, which led, however to renewed opposition on the part of the Calvinistic party. At length, after much painful contention, he was allowed to instruct the Remonstrant students in philosophy and Hebrew on certain somewhat humiliating conditions. For the rest of his life he continued professor in the Remonstrant college, declining in 1744 the Greek chair at Basel. In 1746 he once more visited England, and collated Syriac MSS. for his great work. At last this appeared in 1751–52, in two folio volumes, under the title *Novum Testamentum Græcum Editionis Receptæ cum Lectionibus Variantibus Codicum MSS.*, etc. He did not venture to put new readings in the body of his page, but consigned those of them which he recommended to a place between the text and the full list of various readings. Beneath the latter he gave a commentary, consisting principally of a mass of invaluable illustrations and parallels drawn from classical and rabbinical literature, which has formed a storehouse for all later commentators. In his *Prolegomena* he gave an admirable methodical account of the MSS., the versions, and the readings of the fathers, as well as the troubled story of the difficulties with which he had had to contend in the prosecution of the work of his life. He did not long survive the completion of this work. He died at Amsterdam, March 9, 1754.

Wetstein's New Testament has never been republished entire. The London printer Bowyer, published, in 1763, a text in which he introduced the readings recommended by Wetstein; Semler republished the *Prolegomena* and appendix, 1764; A. Lotze commenced a new edition of the work, but the *Prolegomena* only appeared (Rotterdam, 1831), and this "castigated." It is generally allowed that Wetstein rendered invaluable service to textual criticism by his collection of various readings and his methodical account of the MSS. and other sources, and that his work was rendered less valuable through his prejudice against the Latin version and the principle of grouping MSS. in families which had been recommended by Bentley and Bengel.

See Wetstein's account of his labors and trials in his *Nov. Test.*, i.; articles in Illgen's *Ztschr. für histor. Theol.* by C. R. Hagenbach (1839), by Van Rhyn in 1843, and again by Böttger in 1870; Tregelles, *Account of the Printed Text of the New Testament*; Scrivener's *Introduction to the Criticism of the New Testament*; Gass, *Protestantische Dogmatik*, vol. iii.; Bertheau's art. in *Herzog's Real-Encyklopädie*, 2d ed., 1886.

WETTE, DE. See DE WETTE.

WEXFORD, a maritime county of Ireland, in the province of Leinster, is bounded N. by Wicklow, E. and S. by St. George's Channel, and W. by Waterford, Kilkenny, and Carlow. Its greatest length from its northeastern extremity at Kilmichael Point to Hookhead Point at Waterford Harbor is upwards of 60 miles, and its greatest breadth from east to west 34 miles. The area is 576,588 acres, or about 901 square miles.

The coast-line does not present any striking features, and owing to the number of sandbanks navigation is dangerous near the shore. The only inlet of importance on the east coast and the only safe harbor is Wexford Harbor, which owing to a bar is not accessible to large vessels at ebb tide. On the south coast are the fishing harbors of Crossfarnogue and Fethard. Several islets adjoin the coast. South from Crossfarnogue Point are the Saltee Islands, and Coningmore and Coningbeg, beyond the latter of which is the Saltee lightship. Southeast from Greenore Point is the Tuskar Rock.

The basis of the county is clay-slate, and the surface is chiefly a series of verdant low hills, except towards the northern and western boundaries. The clay-slate formation is interrupted by patches of quartz rock near Gorey, one south of Enniscorthy, and another south of Wexford. To the north of Gorey there is a protrusion of greenstone trap. The elevated ridge on the northwestern boundary forms the termination of the granitic range in Wicklow, and in Croghan Kinshela, on the borders of Wicklow, rises to a height of 1985 feet. On the western border, a granitic range, situated chiefly in Carlow, extends from the valley of the Slaney at Newtonbarry to the confluence of the Barrow with the Nore at New Ross. In the southern district, a hilly region, reaching in Forth Mountain a height of 725 feet, forms with Wexford Harbor the northern boundaries of the baronies of Forth and Bargy, a peninsula of flat and fertile land. Carboniferous limestone crops to the surface on the southern shore of Wexford Harbor, and forms also the extremity of Hookhead Point. Marble is quarried on the right bank of the Barrow, and ochres are dug on the coast districts. The river Slaney enters the county at its northwestern extremity, and flows southeast to Wexford Harbor. Its chief tributary is the Bann, which flows southwestwards from the borders of Wicklow. The Barrow forms the western boundary of the county from the Blackstairs range of mountains till its confluence with the Suir at Waterford Harbor.

Agriculture.—The soil for the most part is a cold and stiff clay resting on clay-slate. The interior and western districts have it much inferior to those round the coasts. In the southeastern peninsula of Forth and Bargy the soil is a rich alluvial mould mixed with coralline sandstone and limestone. The peninsula of Hookhead, owing to the limestone formation, is specially fruitful. In the western districts of the county there are large tracts of turf and peat-moss. In 1876, according to the *Return of Owners of Land*, Wexford was divided among 1757 proprietors possessing 573,052 acres at an annual value of £374,517 [$1,820,152.62], or about 13s. [$3.16] an acre all over. Of these proprietors 581 possessed less than 1 acre. There were about 4500 acres of waste or common land. The following proprietors possessed upwards of 8000 acres: Lord Carew, 17,831; Lady Adelaide Forbes, 15,216; marquis of Ely, 14,023; Viscount Powerscourt, 11,730; Lord Templemore, 11,327; William Orme Foster, 9724; Hon. Mrs. Deane Morgan, 9413; Anne Colclough, 9328; Sir James Power, 8599; F. A. Leigh, 8281; and representatives of J. H. R. Rowe, 8003. Out of a total area of 575,700 acres in 1886, there were 202,543 acres, or 35.2 per cent., under crops, including meadow and clover, 303,788 or 52.8 per cent. under grass, 431 acres fallow, 10,583 woods and plantations, 15,090 bog and marsh, 19,082 barren mountain land, and 24,183 water, roads, fences, etc. The total number of holdings in 1886 was 16,074, of which only 16 were above 500 acres in extent, 1045 between 100 and 500 acres, 2429 between 50 and 100, 2703 between 30 and 50, 3019 between 15 and 30, 3081 between 5 and 15, 2161 between 1 and 5, and 1620 not exceeding 1 acre. The decline in the area under crops between 1849 and 1886 has been much below the average for Ireland—from 245,514 acres to 202,543. In 1876 the area was 221,018 acres, so that there has been a large decline within the last ten years. In the area under meadow and clover there has been an increase from 39,343 in 1849 to 61,327 in 1876 and 64,064 in 1886, but within the last ten years the area has been fluctuating. There has been no marked change in the area under green crops, which was 44,735 acres in 1849, 50,498 in 1876, and 45,958 in 1886. The area under corn crops has, however, declined nearly a half, being in 1849 163,321 acres, in 1876 109,193 acres, and in 1886 only 92,512 acres. Of green crops there has been since 1849 a great increase in the area under turnips, and a corresponding decrease in the area under potatoes: in 1849 they were respectively 9763 and 32,017 acres, and by 1876 they had changed to 19,704 and 23,974 acres, and by 1886 to 21,857 and 18,888 acres. There were also in 1886 2848 acres under mangel-wurzel and beetroot, and 3365 under other green crops. Of the corn crops the area under wheat has declined from 44,592 acres in 1849 to 6948 in 1876 and 4541 in 1886, the area under oats from 80,166 acres to 47,065 in 1876 and 50,381 in 1886, while that under barley and bere increased from 36,563 acres in 1849 to 51,321 acres in 1876, but since then has declined to 35,036 acres. The number of horses in 1886 was 27,778, of which 942 were used for recreation. Mules numbered 1767, and asses 8031. Cattle numbered 126,410, of which 37,936 were milch cows. The number of sheep was 122,373, of which 48,243 were one year old and upwards. Pigs numbered 67,478, goats 6369, and poultry 571,107, of which 34,293 were turkeys and 60,414 geese.

Communications.—The Dublin, Wicklow, and Wexford Railway intersects the county; and from Wexford a branch of the Great Southern and Western passes northwestwards joining the lines to Kilkenny and Kildare. The river Slaney is navigable for barges to Enniscorthy, and the Barrow for large vessels to New Ross.

Manufactures.—Except in the town of Wexford the manufactures and trade are of small importance. There are important fisheries at Wexford, and one or two fishing villages along the south coast. The fishing grounds are good.

Administration and Population.—According to the calculation of De Burgo the population in 1760 was 66,804; the parliamentary census of 1812 places at 112,000; in 1821 it amounted to 170,806, in 1841 to 202,033, in 1861 to 143,954, in 1871 to 132,666, and in 1881 to 123,854 [60,928 males and 62,926 females). Roman Catholics in 1881 formed 91.1 per cent. of the population, and Protestant Episcopalians 8.2 per cent. In 1881 the number of persons who could read and write amounted to 51.5 per cent. of the population, 15.3 per cent. could read but not write, and 33.2 per cent. could neither read nor write,—14.7 per cent. being under seven years of age. All could speak English, and 512 could speak English and Irish. By the Act of 1885 Wexford, which formerly returned two members to parliament, was divided into two parliamentary divisions, North and South, each returning one member, the borough of Wexford, which formerly returned one member, and the portion of the borough of New Ross within the county, being merged in the South Division. The principal towns are Wexford (12,163), New Ross (of which a portion containing 6375 is in this county, the other portion containing 295 inhabitants being in Kilkenny), Enniscorthy (5666), and Gorey (2450). The county is divided into ten baronies, and contains 144 parishes and 1600 town-lands. Episcopally it is in Ferns diocese, except a small portion, which is in Dublin. Judicially it is in the Leinster circuit, and assizes are held at Wexford, and quarter sessions at Enniscorthy, Gorey, New Ross, and Wexford. There are eleven petty sessions districts, and parts of two others. Wexford includes the poor law unions of Gorey and Wexford, and parts of Enniscorthy, New Ross, and Shillelagh. It is within the Cork military district, and along with Kilkenny, Tipperary, and Waterford forms No. 69 sub-district, the brigade depôt of which is at Clonmel. There are barrack stations at Wexford, Duncannon Fort, and New Ross.

History and Antiquities.—The peninsula of Hookhead is the ancient *Sacrum Promontorium.* The northern portion of Wexford was included in *Hy Kinselagh*, the peculiar territory of the Macmorroughs, overlords of Leinster, who had their chief residence at Ferns. Dermod Macmorrough, having been deposed from the kingdom of Leinster, asked help of Henry II., king of England, who authorized him to raise forces in England for the assertion of his claim. He secured the aid of Strongbow by promising him the hand of Eva, and in addition obtained assistance from Robert Fitzstephen and Maurice Fitzgerald of Wales. On the 1st May, 1169, Fitzstephen landed at Bagenbon on the south side of Fethard, and after four days' siege captured the town of Wexford from its Danish inhabitants. After this Dermod granted the territory of Wexford to Fitzstephen and Fitzgerald and their heirs for ever. Macmorrough having died in 1172, Strongbow became lord of Leinster. At first Henry II. retained Wexford in his own possession, but in 1174 he committed it to Strongbow. The barony of Forth is almost entirely peopled by the descendants of those who accompanied these English expeditions. Wexford was one of the twelve counties into which the conquered territory in Ireland was divided by King John in 1210, and formed part of the possessions of William Mareschal, earl of Pembroke, who had married Strongbow's daughter. Through the female line it ultimately passed to John Talbot, earl of Shrewsbury, who in 1446 was made earl of Waterford and baron of Dungarvan. In 1474 George Talbot was seneschal of the liberty of Wexford. The district was actively concerned in the rebellion of 1641; and during the Cromwellian campaign the town of Wexford was on 9th October, 1649, carried by storm, and a week later the garrison at New Ross surrendered,—a "seasonable mercy," according to Cromwell, as giving him an "opportunity towards Munster." Wexford was the chief seat of the rebellion of 1798, the leaders there being the priests. Evidences of the Danish occupation are seen in the numerous raths, especially at Dunbrody, Enniscorthy, and New Ross. Among the monastic ruins special mention may be made of Dunbrody abbey, of great extent, founded in 1182 for Cistercian monks by Henry de Montmorency, marshal of Henry II.; Tintern abbey, founded in 1200 by William Mareschal, earl of Pembroke, and peopled by monks from Tintern abbey in Monmouthshire: the abbey of St. Sepulchre, Wexford, founded shortly after the invasion by the Roches, lords of Fermoy; Ferns abbey, founded by Dermod Macmorrough; and the abbey of New Ross, founded by St. Alban in the 6th century. There are a considerable number of old castles, including Ferns, dismantled by the Parliamentary forces under Sir Charles Coote in 1641, and occupying the site of the old palace of the Macmorroughs; the massive pile of Enniscorthy, founded by Raymond le Gros: Carrick Castle, near Wexford, the first built by the English; and the fort of Duncannon, which has been garrisoned since the time of the Spanish Armada, and caused some trouble to Cromwell when in Wexford.

WEXFORD, a seaport, market-town, and municipal borough, and the chief town of the above county, is finely situated on the south side of the Slaney, where it discharges into Wexford Harbor, on the Dublin, Wicklow, and Wexford Railway and a branch line of the Great Southern and Western, 82 miles south of Dublin and 15 southeast of Enniscorthy. Wexford Harbor formed by the estuary of the Slaney, is about 3 miles from north to south and about 4 from east to west, and has an area of about 1300 acres. A fine bridge of wood and iron 1500 feet in length crosses a narrow part of the estuary. The harbor affords splendid accommodation for shipping, but its advantages have been in great part lost by a bar at its mouth preventing the entrance of vessels drawing more than 12 feet. The construction of a pier at Rosslare connected with Wexford by a railway has, however, proved of great benefit. The town consists of the quay, about 1000 feet in length, with two narrow streets running parallel with it, and other smaller ones branching off at intervals. Some remains of the old walls and flanking towers still exist. The Protestant Episcopal church near the ruins of the ancient abbey of St. Sepulchre, is said to occupy the spot where the treaty was signed between the Irish and their English invaders in 1169. The principal modern buildings are the town-hall, the theatre, the court-house, the barracks, occupying the site of the ancient castle,. St. Peter's College for the education of Catholic clergy, the county infirmary, the union workhouse, and a number of convents. The port has communication by steamer with Liverpool and Bristol. In 1886 the number of vessels that entered the port was 847 of 85,004 tons, the number that cleared 836 of 84,065 tons. The principal exports are agricultural produce. live stock and whiskey. Ship-building is carried on, and also tanning, malting, brewing, iron-founding, distilling, and the manufacture of artificial manure, flour, agricultural implements, and rope and twine. The population of the town in 1871 was 12,077, and in 1881 it was 12,163.

Wexford was one of the earliest colonies of the English, having been taken by Fitzstephen. It was the second town that Cromwell besieged in 1649. It was garrisoned for

William III. in 1690. In 1798 it was made the headquarters of the rebels, who, however, surrendered it on the 21st June. In 1318 the town received a charter from Aldomar de Valence, which was extended by Henry IV. in 1411, and confirmed by Elizabeth in 1558. By James I. it was in 1608 made a free borough corporate, by the title of "the town and free borough corporate of Wexford." It returned two members to parliament from 1374 till the Union, when they were reduced to one. In 1885 it was included in the South Division of the county.

WEYMOUTH AND MELCOMBE REGIS, a seaport, watering-place, market-town, and municipal borough of Dorset, England, is situated at the mouth of the small river Wey, on Weymouth Bay, opposite the Isle of Portland, and on the London and Southwestern Railway and a branch of the Great Western, 7½ miles south of Dorchester, 27¼ west-southwest of Poole Junction, and 145½ from London. It is formed of Weymouth, a fishing town and seaport on the southwest of the Wey, and Melcombe Regis on the northeast of the river, the two towns being connected by a bridge reconstructed in 1881. An esplanade about a mile in length fronts the sea. To the south of the esplanade is a pier of stone on wooden piles 1050 feet in length, erected in 1859 at a cost of £12,000 [$58,320]. The harbor lies between the pier on the north and the spur of land called the Nothe on the south, and is protected by a concrete wall extending 500 feet northward from the Nothe. The principal buildings are the old town-hall, the market-house, the guild-hall, the masonic hall, the royal Dorset yacht clubhouse, the theatre, the Royal Victoria Jubilee Hall, the Weymouth and Dorset eye infirmary, the Weymouth royal hospital and dispensary, the Weymouth sanatorium for women and children, and the infantry barracks. Opposite the Royal Terrace is an equestrian statue of George III., erected in 1809 in commemoration of his jubilee. A marble statue was also erected to Sir H. Edwards in 1885. A mile southwest of Weymouth is Sandsfoot Castle, a fort erected by Henry VIII. for the protection of the shipping. There are a number of almshouses and other charities. Weymouth has steam connections with the Channel Islands, France, and various ports on the English coast. In 1886 903 vessels of 105,824 tons entered the port, and 905 of 98,964 tons cleared. The principal exports are Portland stone, bricks and tiles, and provisions, and the imports are coal, timber, garden and dairy produce, and wine. Ship and boat building, rope and sail making, and brewing are carried on. The population of the municipal borough of Weymouth and Melcombe Regis (area 763 acres) in 1871 was 13,259, and in 1881 it was 13,715.

Both Weymouth and Melcombe Regis are very ancient. The port is supposed to have traded with Tyrian merchants before the arrival of the Romans. Various Roman remains, including pavements and coins, have been found. Weymouth was the scene of Atheistan's vengeance on his half-brother, Prince Edwin. It received a charter from Ethelred, which is preserved in Winchester cathedral. In the time of Edward the Confessor Weymouth and Melcombe were the property of the abbey of Cerne. In 1280 they formed a royal demesne and part of the dowry of Eleanor of Castile. Both Weymouth and Melcombe first returned members to parliament in the reign of Edward II. In 1347 they sent 20 ships and 264 men for the siege of Calais. Queen Margaret of Anjou landed at Weymouth 17th April, 1471, and in 1506 Philip of Castile and his queen were driven into the port by stress of weather. In 1571 Weymouth and Melcombe Regis were united in one borough, under the title of "mayor, aldermen, bailiffs, burgesses, and commonalty of the borough and town of Weymouth and Melcombe Regis." The town was the scene of repeated conflicts during the Civil War, having been taken by the Royalists 9th August, 1641, and retaken in 1644 by the Parliamentary forces, who stoutly defended it against an attack of nine days' duration in February of the following year. Originally the united borough sent four members to parliament (the only other place returning the same number being the city of London), but in 1832 these were reduced to two, and in 1885 it ceased to be separately represented. Its importance as a watering-place dates from the time that George III. selected it as his favorite resort in the summer season. On 6th December, 1881, Weymouth was constituted a port, the limits to commence at St. Alban's Head, the limit of the port of Poole, and to extend in a western direction along the coast to the western bank of the river Char, being the eastern limit of the port of Exeter, and to include the island of Portland. Among the representatives of the boroughs in parliament are Sir William Penn, father of the founder of Pennsylvania, and Sir Christopher Wren.

WHALE,[1] a name applied rather loosely to various animals of the order *Cetacea*, the general characters and classification of which have been described in the article MAMMALIA (vol. xv. p. 395). All the members of the sub-order *Mystacoceti*, or *Cetacea* with whalebone, are called "whales." But of the *Odontoceti*, or *Cetacea* with teeth, only certain of the larger ones are so termed, the smaller species being popularly spoken of as "bottlenoses," "dolphins," and "porpoises"; yet so indefinitely has the word been applied that a true dolphin (*Delphinus tursio*), not exceeding 8 feet in length, is described in some works as the "smaller bottlenosed whale."

Although by their mode of life so far removed from close observation that it is impossible to become as familiar with them in their natural condition as with many other animals, whales are in many respects the most interesting and wonderful of all creatures; and there is much in their structure and habits which is well worthy of study, much that is difficult to understand, and much that leads to great generalizations and throws light upon far-reaching philosophical speculations. One of the first lessons which a study of these animals affords is that, in the endeavor to discover what a creature really is, from what others it is descended, and to what it is related, the general outward appearance affords little clue, and we must go deep below the surface to find out the essential characteristics of its nature. There was once, and may be still in many places, a common idea that a whale is a fish. To realize the fallacy of this notion we have only to consider what a fish really is, what under all the diversities of form, size, and color known among fishes there is common to them all, and we see that in everything which characterizes a true fish and separates it from other classes, as reptiles, birds, and mammals, the whale resembles the last-named and differs from the fish. It is as essentially a mammal as a cow or a horse, and simply resembles a fish externally because it is adapted to inhabit the same element; but it is no more on that account a fish than is a bat, because adapted to pass a great part of its existence on the wing in the air, nearly related to a bird. The whole structure of a whale is a most instructive instance of a type of organization which is common to and characteristic of the class *Mammalia*, only especially modified or adapted to a peculiar mode of life. We see in every part the result of two great principles acting and reacting upon each other,—on the one hand, adherence to type, or rather to fundamental inherited structural conditions, and, on the other, adaptation to the peculiar circumstances under which it lives, and to which in all probability it has become gradually more and more fitted. The external fish-like form is perfectly suited for swimming through the water; the tail, however, is not placed vertically as in fishes, but horizontally, a position which accords better with the constant necessity for rising to the surface for the purpose of breathing. The hairy covering characteristic of all mammals, which if present might interfere with rapidity of movement through the water, is reduced to the merest rudiments,—a few short bristles about the chin or upper lip,—which are often only present in very young animals. The function of keeping the body warm is supplied by a thick layer of non-conducting material, the "blubber," a peculiarly dense kind of fat placed immediately beneath the skin. The fore-limbs, though functionally reduced to mere paddles, with no power of motion except at the shoulder-joint, have beneath their smooth and continuous external covering all the bones, joints, and even most of the muscles, nerves, and arteries, of the human arm and hand; and rudiments even of hind legs are found buried deep in the interior of the animal, apparently subserving no useful purpose, but pointing an instructive lesson to those who are able to read it.

---

[1] Icel., *hvalr*; Dan. and Swed., *hval*; Anglo-Saxon, *hwæl*; Germ., *wal*, *walfisch*. The meaning apparently is "roller," the word being closely allied to "wheel" (Skeat).

In what follows a more detailed account is given of the best known of those species of *Cetacea* to which the name "whale" is popularly applied, especially those frequenting British waters, than could be given under MAMMALIA.

I. Sub-order **MYSTACOCETI** or Whalebone Whales.

Greenland right whale.

Genus **Balæna.**—The Greenland, or more properly Arctic, right whale (*Balæna mysticetus*) attains, when full-grown, a length of from 45 to 50 feet. Its external form is shown in Fig. 1, from a careful drawing by Mr. Robert Gray. In this species all the peculiarities which distinguish the head and mouth of the whales from those of other mammals have attained their greatest development. The head is of enormous size, exceeding one-third of the whole length of the creature. The cavity of the mouth is actually larger than that of the body, thorax, and abdomen together. The upper jaw is very narrow, but greatly arched from before backwards, to increase the height of the cavity and allow for the great length of the baleen or "whalebone" blades; the enormous rami of the mandible are widely separated posteriorly, and have a still further outward sweep before they meet at the symphysis in front, giving the floor of the mouth the shape of an immense spoon. The baleen blades attain the number of 380 or more on each side, and those in the middle of the series have a length of 10 or sometimes 12 feet. They are black in color, fine and highly elastic in texture, and fray out at the inner edge and ends into long, delicate, soft, almost silky, but very tough, hairs. The remarkable development of the mouth and of the structures in connection with it, which distinguishes the right whale among all its allies, is entirely in relation to the nature of its food. It is by this apparatus that it is enabled to avail itself of the minute but highly nutritious crustaceans and pteropods which swarm in immense shoals in the seas it frequents. The large mouth enables it to take in at one time a sufficient quantity of water filled with these small organisms, and the length and delicate structure of the baleen provide an efficient strainer or hair-sieve by which the water can be drained off. If the baleen were rigid, and only as long as is the aperture between the upper and lower jaws when the mouth is shut, a space would be left beneath it when the jaws were separated, through which the water and the minute particles of food would escape together. But instead of this the long, slender, brush-like, elastic ends of the whalebone blades fold back when the mouth is closed, the front ones passing below the hinder ones in a channel lying between the tongue and the lower jaw. When the mouth is opened, their elasticity causes them to straighten out like a bow unbent, so that at whatever distance the jaws are separated the strainer remains in perfect action, filling the whole of the interval. The mechanical perfection of the arrangement is completed by the great development of the lower lip, which rises stiffly above the jaw-bone and prevents the long, slender, flexible ends of the baleen from being carried outward by the rush of water from the mouth, when its cavity is being diminished by the closure of the jaws and raising of the tongue.

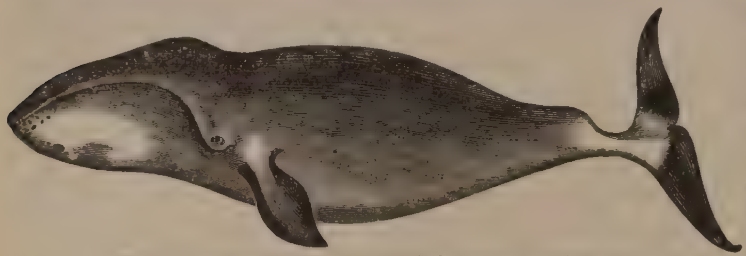


Fig. 1.—Greenland or Arctic right whale (*Balæna mysticetus*).

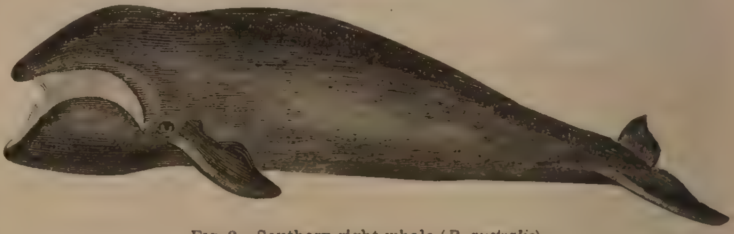

Fig. 2.—Southern right whale (*B. australis*).

If, as appears highly probable, the "bowhead" of the Okhotsk Sea and Behring Strait belongs to this species, its range is circumpolar. Though found in the seas on both sides of Greenland, and passing freely from one to the other, it is never seen so far south as Cape Farewell; but on the Labrador coast, where a cold stream sets down from the north, its range is somewhat farther. In the Behring Sea, according to Scammon, "it is seldom seen south of the fifty-fifth parallel, which is about the farthest southern extent of the winter ice, while in the Sea of Okhotsk its southern limit is about the latitude of 54°." As has been abundantly shown by Eschricht and Reinhardt in the case of the Greenland seas, "everything tends to prove," Scammon says, "that the *Balæna mysticetus* is truly an 'ice whale,' for among the scattered floes, or about the boarders of the ice-fields or barriers, is its home and feeding ground. It is true that these animals are pursued in the open water during the summer months, but in no instance have we learned of their being captured south of where winter ice-fields are occasionally met with. The occurrence of this species, therefore, on the British or any European coast is exceedingly unlikely, as when alive and in health the southern limit of its range in the North Sea has been ascertained to be from the east coast of Greenland at 64° N. lat. along the north of Iceland towards Spitzbergen, and a glance at a physical chart will show that there are no currents setting southwards which could bear a disabled animal or a floating carcase to British shores. To this *a priori* improbability may be added the fact that no authentic instance has been recorded of the capture or stranding of this species upon any European coast, for the cases of its having been reported as seen in British waters may be explained by the supposition of one of the other species of the genus being mistaken for it. Still, as two other Arctic cetaceans, the narwhal and the beluga, have in a few undoubted instances found their way to British shores, it would be rash absolutely to deny the possibility of the Greenland right whale doing the same. Further details of the migrations and habits of this species are given under "Whale Fisheries" (see p. 555 below).

Southern right whale.

The southern right whale (*B. australis*) resembles the last in the absence of dorsal fin and of longitudinal furrows in the skin of the throat and chest, but differs in that it possesses a smaller head in proportion to its body, shorter baleen, a different shaped contour of the upper margin of the lower lip, and a greater number of vertebræ. The genus inhabits the temperate seas of both northern and southern hemispheres and is divided into several species according to their geographical distribution: *B. biscayensis* of the North Atlantic, *B. japonica* of the North Pacific, *B. australis* of the South Atlantic, and *B. antipodarum* and *B. novæ-zelandiæ* of the South Pacific. But the differential characters by which they have been separated, external as well as anatomical, are slight and subject to individual variation; and the number of specimens available for comparison in museums is not yet sufficient to afford the necessary data to determine whether these characters can be regarded as specific or not. The most interesting of these is the right whale, which was formerly abundant in the North Atlantic, but is now so scarce as to appear verging on extinction. This was the whale the pursuit of which gave occupation to a numerous population on the shores of the Basque provinces of France and Spain in the Middle Ages. From the 10th to the 16th centuries Bayonne, Biarritz, St. Jean de Luz, and San

Sebastian, as well as numerous other towns on the north coast of Spain, were the centres of an active whale "fishery," which supplied Europe with oil and whalebone. In later times the whales were pursued as far as the coast of Newfoundland. They were, however, already getting scarce when the voyages undertaken towards the close of the 16th century for the discovery of the northeastern route to China and the East Indies opened out the seas around Spitzbergen; then for the first time the existence of the Greenland whale became known, and henceforth the energies of the European whale-fishers became concentrated upon that animal. It is a singular fact that the existence of the Atlantic right whale was quite overlooked by naturalists till lately, all accounts referring to it being attributed to the Greenland whale, supposed once to have had a wider distribution than now, and to have been driven by the persecution of man to its present circumpolar haunts. To the two Danish cetologists Eschricht and Reinhardt is due the credit of having proved its existence as a distinct species, from a careful collation of numerous historical notices of its structure, distribution, and habits; and their restoration of the animal, founded upon these documents, has been abundantly confirmed by the capture of various specimens in recent times, showing that it still lingers in some of the localities where it formerly was so abundant. The only known instances of its occurrence on the coasts of Europe in modern times are in the harbor of San Sebastian in January, 1854, in the Gulf of Taranto, in the Mediterranean, in February, 1877, and on the Spanish coast between Guetaria and Zarauz (Guipuzcoa) in February, 1878. The skeletons of these three whales are preserved in the museums of Copenhagen, Naples, and San Sebastian respectively. On the coast of the United States several of these whales have been taken within the last few years. In the North Pacific a very similar if not identical species is regularly hunted by the Japanese, who tow the carcasses ashore for the purposes of flensing and extracting the whalebone. In the tropical seas, however, according to Captain Maury's whale charts, right whales are never or rarely seen; but the southern temperate ocean, especially the neighborhood of the Cape of Good Hope, Kerguelen's Island, Australia, and New Zealand, is inhabited by "black whales," once abundant, but now nearly exterminated through the wanton destruction of the females as they visit the bays and inlets round the coast, their constant habit in the breeding time. The range of these whales southward has not been accurately determined; but no species corresponding with the Arctic right whale has as yet been met with in the Antarctic icy seas.

Humpback whale.

Genus **Megaptera.**—The whale commonly called "humpback" (*Megaptera boops*) by whalers, perhaps on account of the low hump-like form of the dorsal fin, is very distinctly characterized from all others of the group, especially by the immense length of the pectoral fins or flippers, which are indented or scalloped along their margins, and are, except at their base, of a white color, nearly all the rest of the body being black. It differs from the right whale and resembles the rorqual in having the skin of the throat and chest marked with deep longitudinal furrows. The baleen plates are short and broad and of a deep black color. Though common in the North Atlantic between Norway and Greenland, this whale does not frequently appear on the coasts of the British Isles. One came ashore at Newcastle in 1839; another, a young one, was taken in the estuary of the Dee in 1863 and its skeleton is preserved in the Liverpool museum; and a nearly full-grown animal was captured in the mouth of the Tay in the winter of 1883–84. The usual length of the adult ranges from 45 to 50 feet. Whales of the genus *Megaptera* are found in the South Atlantic and in both the North and the South Pacific. They resemble those of British seas so closely that it is doubtful whether the differences which have been observed, and upon which several species have been founded, may not have been individual peculiarities; but zoologists have not yet had the opportunity of examining and comparing such a series of specimens of different ages and sexes from different localities as would be necessary to determine these points satisfactorily.

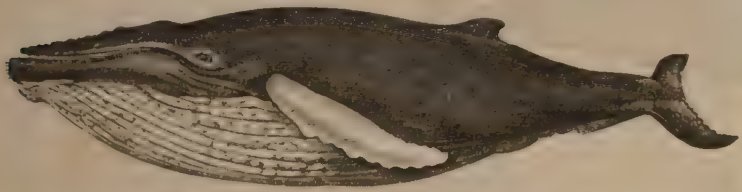

FIG. 3.—Humpbacked whale (*Megaptera boops*).

Rorqual or fin whale.

Genus **Balænoptera.**—The rorquals or fin whales have the plicated skin of the throat like that of *Megaptera*, the furrows being more numerous and close-set; but the pectoral fin is comparatively small and the dorsal fin distinct and falcate. The head is comparatively small and flat, and pointed in front, the baleen short and coarse, the body long and slender, and the tail very much compressed before it expands into the "flukes." The rorquals are perhaps the most abundant and widely distributed of all the whales, being found in some of their modifications in all seas, except the extreme Arctic, and probably Antarctic, regions. Owing to the small quantity and inferior quality of their whalebone, the comparatively limited amount of blubber or subcutaneous fat, and their great activity and the difficulty of capturing them by the old methods, these whales were not until recently an object of pursuit by whale-fishers; but, since the introduction of steam-vessels, and especially of explosive harpoons fired from guns, in the place of those hurled by the human hand, a regular fishery has been established on the coast of Finmark (see p. 557 below). There are four distinct species of this genus in British seas. (1) *Balænoptera sibbaldii*, the "blue whale," the largest of all known animals, attains a length of 80 or even sometimes 85 feet. Its color is dark bluish gray, with small whitish spots on the breast; the baleen is black; the flippers are larger proportionally than in other rorquals, measuring one-seventh of the total length of the body; and the dorsal fin is small and placed very far back. This whale has usually 64 vertebræ, of which 16 bear ribs. Like the others of the genus, this species seems to pass the winter in the open seas, and approaches the coast of Norway at the end of April or beginning of May. At this time its sole food is a small crustacean (*Euphausia inermis*), which swarms in the fjords. Several specimens have been taken on the British coast, two fine skeletons from the Firth of Forth being preserved in the Edinburgh museums. (2) *Balænoptera musculus*, the common rorqual, has a length of 65 to 70 feet, is of a grayish slate color above and white underneath and the baleen is slate color, variegated with yellow or brown. It has usually 62 vertebræ, of which 15 bear ribs. This is the commonest of all the large whales on the British coasts; scarcely a winter passes without the body of one being somewhere washed ashore, usually after stormy weather, and more frequently on the south coast, as this species has a more southern range than the last, and frequently enters the Mediterranean. It feeds largely on fish, and is frequently seen feasting among shoals of herrings. (3) *Balænoptera borealis*, often called Rudolphi's whale from its first describer, is a smaller species, scarcely attaining a length of 50 feet. It is bluish black above, with oblong light-colored spots, whilst the under parts are more or less white; the whole of the tail and both sides of the flippers are black; the baleen is black, and the bristly ends fine, curling, and white; the flippers are very small, measuring one-eleventh of the total length of the body. There are 56 vertebræ, with 14 pairs of ribs. This species, according to Collett, feeds chiefly on minute crustaceans, mainly *Calanus finmarchicus* and *Euphausia inermis*, and not on fish. Until lately it was considered the rarest of the whales of European seas, and was only known to science from a few individuals stranded on the coasts of northern Europe at long intervals, the skeletons of which have been preserved in museums. The most southern point at which it has been met with hitherto is Biarritz in France. Since the establishment of the whaling station near the North Cape it has been shown to be a regular summer visitor, and in 1885 771 individuals were captured on the coast of Finmark. (4) *Balænoptera rostrata*, the lesser fin whale or rorqual, is the smallest species found in the northern seas, rarely exceeding 30 feet in length. Its color is grayish black above, whilst the under side is white, including the whole of the lower side of the tail; the inner side of the flippers is white; and there is a broad white band across the outer side, which is a very characteristic mark of the species; the baleen is yellowish white. The dorsal fin in this and the last species is comparatively high, and placed far forwards on the body. This whale has usually 48 vertebræ, of which 11 bear ribs. It is common in summer in the fjords of Norway, and is often seen around the British Isles. It has been taken, though rarely, in the Mediterranean, and it ranges as far north as Davis Strait. Rorquals are met with in almost all seas throughout the world, but further and more accurate observations are required before their specific characters and geographical distribution can be made out. Nearly all the individuals hitherto examined with any care, whether from the North Pacific, the Australian seas, or the Indian Ocean, come very near in structure to one or the other of the Atlantic forms described above, so much so that some zoologists have been induced to believe that there are but four species, each of which has a wide, almost cosmopolitan range, while others have described and named almost every individual specimen captured as belonging to a different species.

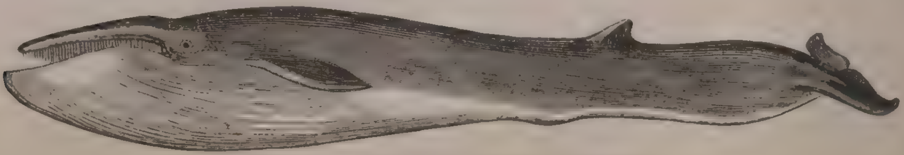

FIG. 4.—Common rorqual (*Balænoptera musculus.*)

Two totally distinct forms of whalebone whales, *Rachianectes glaucus*, the gray whale of the North Pacific (California and Japan), and *Neobalæna marginata* of New Zealand, have never been found in the British seas (see vol. xv. p. 398).

II. **ODONTOCETI** or Toothed Whales.

Sperm whale.

Only one member of this group, the sperm whale or cachalot (*Physeter macrocephalus*), rivals the large whalebone whales in size, its length and bulk being about equal to, or somewhat exceeding, the Arctic right whale, from which, however, it is very different in outward appearance and in structure. The head is about one-third of the length of the body, very massive, high and truncated in front, owing its huge size and remarkable form mainly to the great accumulation of a peculiarly modified form of fatty tissue, filling the large hollow on the upper surface of the skull. The oil contained in cells in this great cavity, when refined, yields spermaceti, and the thick covering of blubber, which everywhere envelops the body, produces the valuable sperm-oil of commerce. The single blowhole is a longitudinal slit, placed at the upper and anterior extremity of the head to the left side of the middle line. The opening of the mouth is on the under side of the head, considerably behind the end of the snout. The lower jaw is extremely narrow, and has on each side from twenty to twenty-five stout conical teeth, which furnish ivory of good quality, though not in sufficient bulk for most of the purposes for which that article is required. The upper teeth are quite rudimentary and buried in the gum. The pectoral fin or flipper is short, broad, and truncated, and the dorsal fin a mere low protuberance. The general color of the surface is black above and gray below, the colors gradually shading into each other. The only known species of sperm whale is one of the most widely distributed of animals, being met with, usually in herds or "schools," in almost all tropical and subtropical seas, but not occurring, except accidentally, in the Polar regions. Not unfrequently specimens appear on the coasts of Great Britain, but only as solitary stragglers, or as dead carcases, floated northwards by the Gulf Stream. It is remarkable that every case of which we have an accurate record has been an old male. The food of the sperm whale consists mainly of various species of cephalopods (squid and cuttlefish), but they also eat fish of considerable size. The substance called "ambergris," formerly used in medicine and now in perfumery, is a concretion formed in the intestine of this whale, and is found floating on the surface of the seas it inhabits. Its genuineness is proved by the presence of the horny beaks of the cephalopods on which the whale feeds.

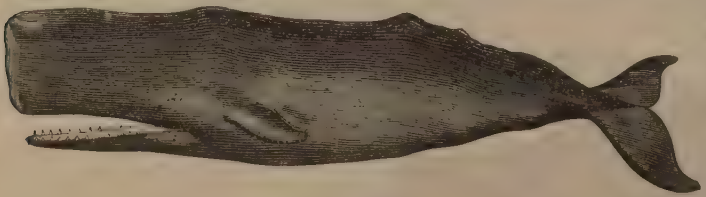

FIG. 5.—Sperm Whale (*Physeter macrocephalus*).

Bottle-nose whale.

The remaining *Odontoceti* are all animals of much smaller size than the sperm whale, but to several of them the name of "whale" is commonly applied. The hyperoodon, sometimes called "bottlenose," a name also vaguely given to several species of dolphin, is a regular inhabitant of the North Atlantic, passing the summer in the Spitzbergen seas and going farther south in winter. It is allied to the sperm whale, and resembles it in possessing a large store of oil in the upper part of the head, which yields spermaceti when refined; on this account, and also for the sake of the blubber, which supplies an oil almost indistinguishable from sperm oil, this whale has been the object of a regular chase in recent years. It is stated in the article MAMMALIA (vol. xv. p. 400) that there are two species of this genus, *Hyperoodon rostratus*, the common hyperoodon, and *H. latifrons*, attaining when adult, respectively, the length of 24 and 30 feet; but recent investigations have shown that the latter is the male and the former the female of the same species. They feed exclusively on cephalopods, and are practically toothless; the only teeth which exist in the adult,—namely, a small pair at the front of the lower jaw,—are concealed beneath the gum during life. Smaller allied species, belonging to the genera *Ziphius* and *Mesoplodon*, occasionally find their way into British seas, but their proper habitat appears to be the South Seas.

Ca'ing or pilot whale.

It frequently happens that large herds or "schools" of whales are captured in bays or inlets on the rocky coasts of Scotland, or the Orkney or Shetland Islands. These are the so-called ca'ing or pilot whale (*Globicephalus melas*), the grindhval of the Faroe Islanders and Norwegians. They attain the length of 20 feet, and are of a nearly uniform black color, except a line down the middle of the under surface, which is gray. They are characterized by the round or globose form of the forepart of the head, occasioned by the great development of a cushion of fat placed over the rostrum of the skull in front of the blowhole, and by the great length and narrowness of the pectoral fin. Their destruction in large numbers, amounting sometimes to hundreds at a time, arises from their eminently sociable character and their habit, when attacked, of rushing together and blindly following the leaders of the herd. When they are seen in the neighborhood of land, the fishermen endeavor to get to seaward of them in their boats, and with shouting and firing of guns to drive them into a bay or fjord, pursuing them until they run themselves on shore in their alarm.

Beluga or white whale.

The beluga (*Delphinapterus leucas*) is often called the "white whale," though scarcely exceeding the length of 12 feet. Its color is almost pure white, and it has no dorsal fin, but a low ridge in its place. It is an inhabitant of the Arctic seas, extending on the American coast as far south as the river St. Lawrence, which it ascends for a considerable distance. Several instances of its occurrence on the coast of Scotland are recorded, and it has been kept for some time in captivity in America, and even in London. Its external characters are represented in vol. xv. p 403, Fig. 50.

The other cetaceans of this group are generally distinguished as narwhals, grampuses, killers, bottlenoses, dolphins, and porpoises, and are not usually called whales.

Fossil species.

We have no certain knowledge of the existence of whalebone whales before the latter part of the Eocene period. The earliest known forms were allied to the existing *Balænopteræ*. Right whales (*Balæna*), as might be expected in the case of such a highly specialized form, have not been found older than the Pliocene; and it is interesting to note that, instead of the individuals diminishing in bulk as we approach the times we live in, as with many other groups of animals, the contrary has been the case, no known extinct species of whale equalling in size those that are now to be met with in the ocean. The size of whales, as of all other things, whose most striking attribute is magnitude, has been greatly exaggerated; but, when reduced to the limits of sober fact, the Greenland right whale of 50 feet long, the sperm whale of 60, and the great northern rorqual (*Balænoptera sibbaldii*) of 80 exceed all other organic structures known, past or present. Instead of living in an age of degeneracy of physical growth, we are in an age of giants, but, it may be, at the end of that age. Through countless ages of time whales have been gradually shaped into their present wonderful form and gigantic size; but the very perfection of their structure and their magnitude combined, the rich supply of oil protecting their internal parts from cold, the beautiful apparatus of whalebone by which their nutrition is provided for, have been fatal gifts, which, under the sudden revolution produced on the surface of the globe by the development of the wants and arts of civilized man, cannot but lead to their extinction in the not far future.

(W. H. F.)

Whale Fisheries.

Commercially these may be conveniently classified under three heads,—the British, the American, and the Norwegian. The implements used, and the mode of capture of the different kinds of whales, being for the most part the same in all cases, the detailed account given below may be held to be of general application, unless the contrary is expressly stated.

Whaler. The *whaler* is a vessel of from 400 to 500 tons gross register, rigged either as a ship or a bark, and provided with auxiliary engines of some 75 horse-power. Built after the strongest fashion, she is protected along the water-line by an additional planking of iron bark, an Australian wood of great hardness; the bows are strengthened inside by beams and knees and outside by plates of iron. Underneath the hold-beams about 50 iron tanks are fitted, each capable of containing 200 to 250 tons of oil; above the hold-beams a deck is laid, engine and boiler space being reserved in the stern. A vessel of this description carries 8 whale-boats, and is manned by 50 to 60 hands all told. Her working expenses at sea, exclusive of insurance and interest on capital, are about £500 [$2430] per month, and her cost as she leaves the builder's hands, supplied with all appurtenances, but exclusive of sea stores, is about £17,500 [$85,050]. **Whale-boat.** The *whale-boat* is 27 feet in length and 6 feet in breadth, with a depth amidships of 2 feet 6 inches. The bow is covered in for the distance of a few feet, forming a sort of platform, through which there project two wooden posts, that farthest forward being called the "gun-bollard head," on which the harpoon gun is mounted, while round the other, farther aft, the whale-line is run. At the stem, between the "head boards," a pulley is sunk, over which the whale-line glides. On the port bow, beside the gun-bollard head, a small tub is fitted, into which is coiled that part of the whale-line known as the "foregoer." The after-part of the boat, as well as a part amidships, is fitted up for the reception of the whale-line. The whale-boat is manned by five oarsmen and a boat-steerer. The bow oar acts as harpooner and has charge of the boat; the stroke-oar is "line-manager" and watches the whale-line while it is running. **Harpoon gun.** The *harpoon gun*, now almost universally used, measures 4 feet 6 inches in length and weighs 75 lb; the barrel is 3 feet long with 1½ inches bore and is mounted in a wooden stock, tapering behind into a pistol handle. The weapon is fired by means of percussion caps, doghead, and trigger-line, the nipples being protected from sea spray by a movable brass cover. Mounted in a swivel on the gun-bollard head, the harpoon gun from its elevated position commands both bows as well as right ahead; and with a charge of 11 drachms of powder it projects the harpoon with force and precision to a distance of 25 yards. **Harpoons.** *Harpoons* are of two kinds, known respectively as gun and hand harpoons; the former are used as weapons of attack, the latter to assist in securing a whale that is already harpooned. The *gun harpoon* measures 4 feet in length and weighs 12 lb. The "shank," or that part which enters the gun, is perforated throughout its length by an elongated slit, so as to allow the "shackle" connecting the harpoon with the line to remain outside the mouth of the gun when the shank is inserted in the barrel. When the gun is fired, the shackle travels along the slit until it is brought up by the butt, where the two rods of which the shank is composed unite, and after that the line is drawn out by the harpoon. The head of the harpoon is triangular and flattened, the two sides being continued backwards to form the barbs, which may be movable or fixed. When movable they are attached to the head by steel pins, and previous to being fired fold backwards and lie parallel to the shank; the weapon having pierced a whale, and the strain on the whale-line causing it to retract, the barbs spread out and assume a transverse position, so as greatly to impede the withdrawal of the instrument. The *hand harpoon* is a light and efficient weapon, which was introduced by the Americans, by whom it is known as a "toggle iron." It consists of a head and shank of iron, and is mounted on a wooden stock, by which it is darted. The head, a flattened piece of steel, somewhat triangular in form, is connected with the extremity of the shank by a steel pin, on which it pivots and moves freely. Previous to use the head folds back along the shank, in which position it is retained by a wooden pin. After the weapon has been darted into a whale, the strain on the line breaks the wooden pin, and the head assumes a position at right angles to the shank, somewhat in the form of the letter T, and becomes transfixed in the fibrous tissue under the blubber. The shank is a rod of ½-inch iron, 2 feet 6 inches long, expanding at its upper extremity to form a socket to receive the wooden stock. The hand harpoon measures 8 feet in length, and, exclusive of the line, weighs 10 lb. Expert harpooners can dart the weapon about 5 yards with considerable force and accuracy. **Whale-line.** *Whale-line* is three-stranded rope, 2¾ inches in circumference, composed of the finest hemp, 32 yarns per strand; 600 fathoms are coiled into each whale-boat. The line is joined to the harpoon by the "foregoer," a piece of rope somewhat lighter and more pliable than whale-line. The foregoer being the only part of the line drawn out by the harpoon while in flight, its length, usually from 10 to 12 fathoms, regulates the distance the harpoon may be fired. **Whale-lance.** The *whale-lance* consists of a simple rod of ½-inch iron, 6 feet long, one end flattened to form a small lance-shaped point with cutting edges, the other expanding to form a socket to receive a short wooden handle. Gun lances, bomb lances, and exploding harpoons of various forms and devices have from time to time been introduced; but, mainly from the fact that in recent years the difficulty in securing a cargo lies not so much in effecting the capture of the animal as in discovering its whereabouts, and in approaching sufficiently near to permit the use of the harpoon, they have never come into general use.

Whale-hunting. Whether the ship is cruising amongst loose ice under canvas or lying "made fast" to a floe, a careful look-out is kept on board from the crow's nest (a barrel lashed to the main-top-gallant mast-head) as well as from the deck. Immediately on a whale being seen, boats are manned and sent in pursuit. If the animal is feeding, which it generally does when near the surface by swimming backwards and forwards horizontally round an ellipse, great caution is necessary to prevent its becoming aware of the approach of the boats. On the other hand, if the whale is "spanning," *i.e.*, swimming in a decided direction and appearing at the surface at intervals more or less regular, less caution is observed. In either case as well as under less usual circumstances the whale-boat, endeavoring to keep out of the angle of vision of the animal, approaches it from behind, swiftly but quietly; the harpooner rises to his gun and points it at the animal's back, withholding his fire, however, until within as short a distance as possible. On being harpooned the Greenland right whale usually dives perpendicularly, remaining under water about forty minutes and drawing out some 600 to 700 fathoms of line before it returns to the surface. Whales descend with such velocity that they have been known to break their upper jaw by coming into violent contact with the bottom even in 400 fathoms of water. Before the animal has returned to the surface other boats have arrived upon the scene, and, on the reappearance of the whale, give chase and attach more harpoons. Again the whale dives, but soon returns to the surface, still more exhausted. Whenever its motions become sufficiently slow to permit the approach of the boats, the lance is used, a few thrusts in the region of the heart or lungs being speedily fatal. Quantities of blood are thrown up by the spiracles; the animal lashes the water with its fins, and, after rushing violently through the water in its dying agony, rolls over on its side and lies stiff and rigid at the surface. Under favorable circumstances the capture of a full-grown whale from the time of first harpooning until its death occupies from one to one and a half hours. The operation of flensing is next performed. The body of the whale is lashed lengthwise alongside the ship with its under surface above water; the "cant-purchase," a powerful tackle, is then attached to the commencement of a transverse slip of blubber cut at the neck, known as the "cant-piece." By means of the cant-purchase the body is caused to rotate, whilst the fat is removed from the different parts as they appear above water in large "slips" or "blanket-pieces," each a ton or more in weight. After being received on deck, the blubber is cut into pieces about a foot square and stowed into the "'tween-decks." The whalebone is removed from each side of the upper jaw as it appears above water *en bloc*. The process of "cutting-in" occupies the ship's company about three hours. The only subsequent operations are the cutting up of the blubber into small pieces and its stowage in the oil tanks. The removal of the gum from the whalebone, the separation of the plates, and their stowage in the 'tween decks are operations performed subsequently.

British Fisheries.

Greenland fishing.

Greenland Right Whale.—The Greenland right whale (*Balæna mysticetus*) is found amongst, or in the near vicinity of, the Polar ice. Its habitat, however, is materially reduced in extent by the shallowness of many parts of the Arctic Ocean—*e.g.*, of the Barents and Kara Seas and the sea to the north of Siberia—localities where the species is quite unknown. The fishing is prosecuted off Greenland and in Davis Strait by the British, and at Behring Strait by the Americans.

Sailing either directly from the home ports in April or proceeding thither after prosecuting the sealing, the British whale ships arrive at the north Greenland whaling-grounds off the west coast of Spitzbergen early in May. If it is a "close" season, *i.e.*, if the ice of the Barents Sea comes west round the south end of Spitzbergen, and effects a junction with the Greenland ice, so as to form a southeast pack, the ships have sometimes to force their way through several hundred miles of ice before reaching the grounds. On the other hand, if it is an "open" season, as more usually occurs, the barrier ice in lat. 80° may be reached without hindrance. In cruising for whales certain indications are sought which the whalemen know by experience to be favorable to the appearance of the animal. The first of these is "whaling ice," or moderately loose ice with close pack or floes in the neighborhood. The second is abundance of food. The presence of this condition may be ascertained by a surface net, or it may be inferred from the color of the water, which varies from the barrenness of clear cold cerulean to the richness of opaque and warm olive green. The crustacean *Calanus finmarchicus*, the pteropod *Clione limacina*, and the gasteropod *Limacina helicina* are amongst the most abundant forms, the first mentioned contributing perhaps nine-tenths of the whale's food. Yet very little is known positively as to the food of the Greenland right whale. According to whalemen (and the idea has hitherto been generally accepted by naturalists), the animal lives upon various invertebrate forms, such as *Actiniæ*, *Schiæ*, *Cliones*, *Medusæ*, *Cancri*, and *Helices*. Scoresby states that some of these genera are always to be seen wherever whales are found stationary and feeding. Dr. John Murray, however, is of opinion that whales also resort for food to the larger forms of pelagic fauna which exist in the immediate vicinity of the bottom of the ocean, and the presence of which was ascertained during the course of the "Challenger" investigations. The third condition is abundance of the higher forms of life, such as birds, especially guillemots (*Uria grylla*) and looms (*Alca arra*), also narwhals (*Monodon monoceros*), seals, bears, etc. The whales make their appearance amongst the ice near the sea edge about 15th May, but only remain in the locality until the opening of the barrier ice permits them to resume their northward journey, for usually about the middle of June they suddenly disappear from these grounds, and are last seen going northwest. The north Greenland whale-fishing is then over for the season. If unsuccessful in obtaining a cargo at the northern grounds, the whale ships next proceed southwards as far as lat. 75°; then, if the sea is sufficiently open, they penetrate westwards until the coast of Greenland is visible. There they cruise amongst the ice until August, when the darkness of the nights puts an end to the fishing.

Davis Strait fishing.

If the southwest fishing is first prosecuted, the vessels arrive at the ice edge near Resolution Island in April. Here, although numbers of large whale are usually seen, yet, owing to the boisterous weather and the compact nature of the ice, the fishing is seldom very successful, so that the majority of the vessels, after prosecuting the "saddle" sealing at Newfoundland or Greenland, proceed direct to Disco, where they usually arrive early in May. The whales make their appearance at South-East Bay about 15th May, and here, where once a great fishing was carried on, a few whales may be killed. The dangerous passage of Melville Bay is next performed and the whale ships, entering the north water in June, push on towards the sounds. If there is a "land-floe across," *i.e.*, if the land-ice of the west side is continuous across the entrance of Pond's Bay and Lancaster Sound, whales will be seen in considerable numbers and good cargoes may be obtained; but immediately the land-floe breaks up the whales depart to the westward. When there is no land-floe across, the whales proceed at once into the secluded waters of Eclipse Sound and Prince Regent Inlet, where they resort during the summer months. At this season of the year most of the vessels cruise in the sounds, while a few search the middle ice, until the darkness of the August nights compels them to seek an anchorage in some of the harbors of the west side, where they await the return of the whales south. This migration takes place on the formation of young ice in the sounds, usually in the latter part of September. Only the larger individuals, however, and the great majority of these males, come close down along the land of the west side. These the ships send their boats out to intercept, and this forms the inshore fishing or "rock-nosing," which is continued until the formation of young ice drives the vessels out of their harbors, usually early in October.

Hudson's Bay fishing.

A few vessels, American as well as British, occasionally enter Hudson's Bay and prosecute the fishing in the neighborhood of Southampton Island, and even enter Fox Channel. There are whaling-stations in Cumberland Inlet, and a few vessels usually remain all winter, ready to take advantage of the opening of the ice in the following spring. Here the young as well as the old whales make their appearance in May; the former have migrated south during the previous autumn amongst the archipelago of islands forming the west side into Fox Channel, thence by Hudson's Strait to the pack-ice off Resolution Island, where, together with the old whales, they probably winter. Early in May the whalemen drag their boats over the ice to the open water at the floe edge, and the whales are seen amongst the pack-ice in the offing, the younger whales being nearest the land-floe. Encampments are formed along the floe edge, and the fishing is continued until the whales migrate north in June.

Produce of Greenland whale fishing.

The average full-grown Greenland right whale yields about 15 tons of oil and 15 cwts. of whalebone, although individuals are occasionally killed which yield nearly 30 tons of oil and 30 cwts. of whalebone. The whalebone consists of about 590 slips, the longest measuring 10 feet 6 inches and weighing 5¼ lb in an average animal, 12 feet 6 inches and 9½ lb in a very large one. The following table shows the returns of these fisheries from 1860 to 1886 inclusive, in so far as British vessels were concerned. It will be seen that a constant decrease has taken place both in the number of whales killed and in the total value of the produce. The price to which oil has fallen little more than pays the expense and trouble attending its being taken on board and its subsequent preparation for the market, and there can be little doubt that, but for the high price which whalebone commands, the fishing would long ere this have been abandoned as unremunerative.

Year	Whales Killed.			Produce.		Value.		
	Off Greenland.	In Davis Strait.	Total.	Tons of Oil.	Cwts. of Whalebone.	Of Oil per cwt.	Of Whalebone[1] per cwt.	Of Total Produce.

---

[1] The figures given are the values of "size-bone," *i.e.*, slips of whalebone exceeding 6 feet in length, which is twice the value of whalebone under that length, so that before the exact value of the produce could be arrived at it has been found necessary to compute 17 per cent. of the whalebone at half the figure given, being the proportion of whalebone under size in an average whale.

History of Greenland whale fishing.

History.—As already stated (see above, p. 552) a right whale fishery of great importance was prosecuted in the temperate waters of the Atlantic at a very early period, more especially by the hardy seamen of the Basque provinces from the 10th to the 16th century. Authorities are now agreed that the whale pursued was *Balæna biscayensis*, which differs from *B. mysticetus* in its smaller size, its greater activity, and its more southern distribution. The Greenland right whale fishery owes its origin to Henry Hudson's first voyage to Greenland and Spitzbergen in 1607. His glowing accounts of the great numbers of whales and morses led to the despatch of Jonas Poole to the Greenland Sea by the Muscovy Company, and the success of his four voyages (1609-1612) speedily attracted the vessels of other nations. For a time the English endeavored to obtain a monopoly of the fishing; but, the other nations resisting, hostilities were engaged in, which resulted in the discomfiture of the English by a Dutch fleet in 1618. Thereafter it was agreed that different parts of the Spitzbergen coast should be allotted to different nationalities. The English interest in the industry, however, declined, and the fishing fell mainly into the hands of the Dutch, who until 1640 also carried on an important fishing in the seas surrounding the island of Jan Mayen. Meanwhile they did not neglect the Spitzbergen fishery, in which 10,019 whales were taken by them in the ten years 1679-1688. About 1680, when their fishing was probably at its most prosperous stage, they had 260 vessels and 14,000 seamen employed. Their fishery continued to flourish on almost as extensive a scale until 1770, when it began to decline, and finally, owing to the war, came to a close before the end of the century. At the same time the Germans prosecuted the fishing to a very considerable extent: 79 vessels from Hamburg and Bremen were employed in 1721, and during the fifty years 1670–1719 an average of 45 vessels sailed yearly from Hamburg alone. German vessels continued to engage in the fishing until 1873. The Spaniards, although they took part in the pursuit at an early date, and appear at first to have supplied the skilled portion of the crews of the English and Dutch vessels, never seem to have engaged largely in the northern fishery; 20 of their vessels were employed in it in 1721, but before the end of the century they had entirely abandoned the occupation. The Danes, although likewise early appearing on the Spitzbergen fishing-grounds, never pursued the industry on a large scale until after the commencement of the Davis Strait fishing in 1721, in which year they had 90 sail engaged; in 1803 the number had fallen to 35. As for the English fishing, although sundry attempts had been made to revive it, notably in 1673 and in 1725 (the latter year by the South Sea Company), it was not until a bounty of 20s. [$4.86] per ton on the burden of the ships employed, granted in 1733, had been increased to 40s. [$9.72] in 1749 that the industry began to revive; in the same year vessels sailed from Scotland for the first time. Notwithstanding the reduction of the bounty to 30s. [$7.29] the number of ships sailing from British ports in 1787 amounted to 255. In 1814 the value of the gross freights of the Greenland and Davis Strait fleets amounted to £700,000 [$3,402,000], and in the same year the "Resolution" of Peterhead, Captain Souter, returned from Greenland with 44 whales, producing 299 tons of oil, the largest cargo ever brought into Great Britain. In 1824 the bounty was finally withdrawn. Since that time, owing to the scarcity of whales, and still more to their increasing shyness, caused in a great measure by the injudicious use of steam, the returns of the fishery have been gradually decreasing and the vessels employed have become fewer.

Sperm whale fishing.

Sperm Whale.—Since 1853 British vessels have ceased to prosecute this fishing. Begun in 1775, the British sperm whale fishing soon increased and by 1791 had assumed considerable importance, when the vessels engaged numbered 75, all hailing from London. It was British sperm whalemen who opened up the whaling-grounds of the Pacific and Indian Oceans.

American Fisheries.

The American whale fisheries embrace the Behring's Strait or Arctic fishery and the sperm whale or southern fishery.

Behring Strait fishery.

Greenland Right Whale.—As already mentioned above, the object of this fishery is the capture of *Balæna mysticetus*. In this case, however, the whales are mostly sought, not among the ice, but in open water, the vessels used being less adapted to ice navigation than those of the British, and nearly all are propelled by sail power alone. The hand harpoon is preferred and bomb lances are used to kill the whales. The vessels sail mostly from San Francisco in March, and arrive at the ice edge off Cape Navarin, where the fishing is first prosecuted, in May. The whales disappear during summer, but return in the autumn, when the "fall" fishing is carried on in the neighborhood of Point Barrow; between seasons the vessels go south and prosecute the sperm whaling. The Behring Strait fishery was commenced in 1848, and in the three following years 250 ships obtained cargoes. In 1871 34 vessels were abandoned in the ice off Cape Belcher, the crews making good their escape to other vessels; again in 1876 12 vessels experienced a similar fate.

Sperm whale fishing.

Sperm Whale.—The capture of the sperm whale (*Physeter macrocephalus*) is prosecuted throughout the tropical seas of the globe. The distribution of the animal being, however, restricted to deep water, the fishing is usually carried on at a distance from land. The vessels used are generally barks of about 300 tons, carrying five boats and manned by a crew of thirty hands all told. The vessels have no particular time for sailing or arriving in port; the duration of a voyage is generally three years. The sperm whale is killed in the same manner as the Greenland right whale; the use of the hand harpoon is, however, preferred; and the whale-boats, which are not required to withstand contact with ice, are less strongly built, and much lighter and swifter than those used in the northern fisheries. The ordinary sperm whale yields about 60 barrels of oil (= 10 tons), although large males are occasionally killed which yield a greater quantity. The oil is boiled at sea; hence its freedom from smell and the consequent high price which it commands as compared with that of the bottlenose whale.

Sperm whale fishing seems to have commenced early in the 18th century, the whaling community of Nantucket embarking in the industry about 1712; and in 1774, before the commencement of the War of Independence, a fleet of 360 vessels was engaged in it. This fishery perhaps reached its climax in 1846, when it occupied a total of 735 vessels, having an aggregate capacity of 233,199 tons. During the period 1877 to 1886 inclusive, the average annual number of vessels employed was 159, their average annual aggregate burden being 35,713 tons. The average annual imports into the United States of whaling produce were as follows: of sperm oil 31, 824 barrels (= 5304 tons), of whale oil 29,180 barrels (= 4863 tons), of whalebone 325,559 ℔ (= 145 tons). New Bedford and San Francisco are the principal whalingports.

Norwegian Fisheries.

The Norwegian fisheries include that of the fin whale and that of the bottlenose whale.

Fin whale fishery.

Fin Whale.—Associated with this fishery is the name of Svend Foyn, the seaman who first invented apparatus to attack successfully the large and active fin whales which abound in northern seas, and at certain seasons frequent the fjords of the north coast of Norway. The principal feature of the whaling gear is the use of an exploding harpoon, which virtually kills the animal immediately it is struck. Owing to its weight, a gun of large size is required to throw the harpoon, and in turn a craft of considerable burden is required to carry the gun. The harpoon bears a shell containing ¾ ℔ powder and weighs 123 ℔; the gun, 4½ inches thick at the muzzle, with 3 inches bore, requires a charge of 1 ℔ powder, and weighs about 15 cwts.; the vessel answering the purpose of a whale-boat is a steamer of about 80 tons burden and 30 horse-power. It is used not only for carrying the gun and pursuing the whales but also for towing the bodies of the animals when dead to the "factory" on shore, where the operation of flensing is performed. The whales hunted (in the order of their size and relative value) are (1) the blue whale (*Balænoptera sibbaldii*), (2) the humpback (*Megaptera longimana*), (3) the common rorqual (*Balænoptera musculus*), (4) Rudolphi's rorqual (*B. borealis*), and (5) the lesser rorqual (*B. rostrata*). All are killed for their oil, which is much inferior in quality to that of the Greenland right whale, for their whalebone, which is short and brittle, and for their bones and flesh, which are converted into manure. The whalers hail from the south of Norway (Sandefjord, Tönsberg, etc.), and have their whaling stations or "factories" on the fjords along the coast of Finmark. The fishing is prosecuted only in summer. In 1884 450 fin whales were killed, in 1885 1398, and in 1886 954.

Bottlenose whale fishery.

Bottlenose Whale.—The bottlenose whale (*Hyperoodon rostratus*) abounds during summer in the northern seas adjacent to the ice edge, from the Labrador coast on the west to Nova Zembla on the east, but more particularly in the neighborhood of Jan Mayen and Iceland, where the fishing is usually prosecuted during May, June, and July. Previous to May the weather is generally too stormy, and about the middle of July the whales, although hitherto numerous, suddenly disappear. The average-size bottlenose whale yields 22 cwts. of oil, 5 per cent. of which is spermaceti; the oil is superior even to sperm as a lubricant. Although the whale-ships had frequented the northern seas for centuries, and sailed over the haunts of these animals season after season, it was not until recent years that they were discovered to exist there in immense numbers. The fishing may be said to date from the capture of 203 of these animals by the "Eclipse," Captain David Gray, of Peterhead in 1882. In the following year a number of British vessels took up the fishing, and at the same time the Norwegians embarked in it to such an extent that the market was soon glutted with oil, and the price fell from £55 [$267.30] per ton to £18 [$87.48], which no longer renders the industry remunerative to British vessels. A fleet of about thirty small sailing vessels annually leaves the Norwegian ports to prosecute this fishing. In 1885 they killed over 1300 whales and in 1886 about 1700.

Literature.—On British whale fisheries, see Scoresby, *Arctic Regions, Voyage to the Greenland Sea in* 1822; M'Culloch, *Dict. of Commerce;* Markham, *Whaling Cruise;* Southwell, "Notes on the Seal and Whale Fisheries," in *Zoologist*, 1884, etc.: F. D. Bennett, *Whaling Voyage round the Globe*, 1833–36; and Beale, *The Sperm Whale and its Captors*, 1839. On American whale fisheries the following works may be consulted: Starbuck, *Hist. of Amer. Whale Fishery from its Earliest Inception to* 1876; *Report of U. S. Comm. of Fisheries*, 1875, vol. iv.; *Whalemen's Shipping List and Merchants' Transcript* (New Bedford); and Scammon, *Mammalia of Northwestern America*, 1874. On the Norwegian whale fisheries there are various papers in the *Zoologist*, by A. H. Cocks, 1884 and succeeding years. (R. GR.)

WHALEBONE is the inaccurate name under which the baleen plates of the right whale are popularly known; and the trade-name of whale-fin, which the substance receives in commerce, is equally misleading. Three kinds of whalebone are recognized by traders—the Greenland, yielded by the Greenland whale, *Balæna mysticetus;* the South Sea, the produce of the Antarctic black whale, *B. australis;* and the Pacific or American, which is obtained from *B. japonica*. Of these the Greenland whalebone is the most valuable. It formed the only staple known in earlier times, when the northern whale fishery was a great and productive industry. This whalebone usually comes into the market trimmed and clean, with the hairy fringe which edges the plates removed. To prepare whalebone for its economic applications, the blades or plates are boiled for about twelve hours, till the substance is quite soft, in which state it is cut either into narrow strips or into small bristle-like filaments, according to the use to which it is to be devoted.

Whalebone possesses a unique combination of properties which render it peculiarly and almost exclusively suitable for several purposes. It is light, flexible, tough, and fibrous, and its fibres run parallel to each other without intertwisting. It has been found practicable to employ flexible steel for several purposes to which whalebone was formerly applied, especially in the umbrella and corset industries, in which steel is now almost exclusively used. Whalebone is, however, still in large demand among dressmakers and milliners; but it is principally used in the brush trade. In cases where bristles are too soft and weak, and where the available vegetable fibres possess insufficient elasticity and durability, whalebone offers the great advantage of being procurable in strips or filaments, long or short, thick or thin, according to requirement. Hence it is principally used for making brushes for mechanical purposes, such as machines for road-sweeping, chimney-sweeping, boiler-flue cleaning, the cleaning of ships' bottoms, and for stable use, etc. The use of whalebone in brush-making was originally patented by Samuel Crackles in 1808, and various special machines have been adapted for cutting the material into filaments. When whalebone came into the English market in the 17th century it cost at first about £700 [$3402] per ton. In the 18th century its price ranged from £350 [$1701] to £500 [$2430] per ton, but early in the 19th century it fell as low as £25 [$121.50]. Later it varied from £200 [$972] to £250 [$1215]; but with the decrease in whaling the article has become very scarce, and upwards of £1500 [$7290] per ton is now paid for Greenland whalebone.

WHALE OILS. The whale or train (Germ. *Thran*) oil of commerce may be obtained from the blubber of any species of whale or dolphin (see WHALE FISHERIES, above). The only whale oil that is otherwise commercially distinguished is sperm or spermaceti oil, yielded by the sperm whales. Whale oil varies in color from a bright honey yellow to a dark brown, according to the condition of the blubber from which it has been extracted. At best it has a rank fishy odor, and the darker the color the more disagreeable the smell. Train oil consists of a glyceride of physetoleic acid (also found in earth-nut oil), together with stearin, palmitin, etc. With lowering of the temperature stearin, accompanied with a small proportion of spermaceti, separates from the oil, and a little under the freezing point nearly the whole of these constituents may be crystallized out. When separated and pressed, this deposit is known as whale tallow, and the oil from which it is removed is distinguished as pressed whale oil; this, owing to its limpidity, is sometimes passed as sperm oil. Whale oil is principally used in oiling wools for combing, in hatcheling flax and other vegetable fibres, in currying and chamois leather-making, and as a lubricant for machinery. Sperm oil is obtained from the enormous cavity in the head of the sperm whale, and from several smaller receptacles throughout the body of the animal. During the life of the whale the contents of these cavities are in a fluid condition, but no sooner is the "head matter" removed than the solid wax spermaceti separates in white crystalline flakes, leaving the oil a clear yellow fluid having a fishy odor. The oil, which has an acid reaction, is purified by treatment with a solution of potash, which precipitates impurities held by the acid of the oil. Refined sperm oil is a most valuable lubricant for small and delicate machinery.

WHARTON, MARQUIS OF. Two noblemen with this title, father and son, hold a certain place in English literary history as subjects of satiric portraiture.

THOMAS WHARTON (1640–1715), a prominent Whig politician at the Revolution, is reputed by Dr. Percy to have been the author of the famous political ballad *Lilliburlero*, which "sang James II. out of three kingdoms." Wharton was lord-lieutenant of Ireland in Anne's reign, and incurred the wrath of Swift, who attacked him as Verres in the *Examiner* (No. 14), and drew a separate "character" of him, which is one of Swift's masterpieces. He was a man of great wit and versatile cleverness, and cynically ostentatious in his immorality, having the reputation of being the greatest rake and the truest Whig of his time. Addison dedicated to him the fifth volume of the *Spectator*, giving him a very different "character" from Swift's.

PHILIP WHARTON (1699–1731), the son of Thomas, succeeded to title and fortune at the age of sixteen, and quickly earned for himself, by his wild and profligate frolics and reckless playing at politics, Pope's satire of him as "the scorn and wonder of our days" (*Moral Essays*, i. 179). He spent his large estates in a few years, then went abroad and gave eccentric support to the Old Pretender. There is a lively picture of his appearance at Madrid in 1726 in a letter from the British consul, quoted in Stanhope's *History of England* (ii. p. 140).

The elder Wharton is described at length by Macaulay as one of the four chiefs of the Whigs after the Revolution (*History*, chap. 20). He was created earl of Wharton in 1706, and marquis in 1714, immediately after the arrival of George I. in England. The younger Wharton succeeded to the marquisate in 1715 on his father's death, and was created duke on coming of age in 1720.

WHATELY, RICHARD (1787–1863), archbishop of Dublin, was born in London on 1st February, 1787. He was the youngest of the nine children of the Rev. Joseph Whately of Nonsuch Park, Surrey. After attending a private school near Bristol (where his father was prebendary), he went to Oxford in 1805 and entered Oriel College, then the most distinguished in the university. Copleston, afterwards bishop of Llandaff, was a college tutor when Whately entered, and had a marked influence upon the younger man. In their long walks together round Oxford they discussed and worked out much that was afterwards embodied in Whately's *Logic*. Whately took a double second-class in honors in 1808, afterwards gaining the prize for the English essay, and in 1811 he was elected fellow of Oriel. He continued to reside at Oxford as a private tutor, and in 1814 took holy orders. The Oriel common-room at that time was full of intellectual life, destined to discharge itself in very varied channels. Besides Copleston and Whately, Davison, Arnold, Keble, and Hawkins were among the fellows, and Newman and Pusey were added about the time of Whately's leaving Oxford. Newman has put on record in his *Apologia* his indebtedness to Whately, who, he says, opened his mind and taught him to think and to use his reason. They soon became separated; but between Arnold and Whately there was a warm friendship till the death of the former. It was at this time that Whately wrote his celebrated tract, *Historic Doubts relative to Napoleon Bonaparte*, a very clever *jeu d'esprit* directed against excessive skepticism as applied to the Gospel history. In 1820 Whately made the acquaintance of Elizabeth Pope, to whom he was married in July of the following year. After his marriage he first settled in Oxford, where he continued to take pupils, and in 1822 he was appointed Bampton lecturer. The lectures, *On the Use and Abuse of Party Spirit in Matters of Religion*, were published in the same year, and were followed by a volume of *Sermons* in 1823. In August, 1823, he removed to Halesworth in Suffolk, a country living to which he had been presented. Here two years were spent in vigorous parish work; but the damp climate nearly proved fatal to Mrs. Whately, and, when he was appointed in 1825 to the principalship of St. Alban Hall, he returned with his family to Oxford. In the same year he took the degree of doctor of divinity. At St. Alban Hall Whately found much to reform, and he left it a different place. In 1825 he published a series of *Essays on Some of the Peculiarities of the Christian Religion*, followed in 1828 by a second series *On Some of the Difficulties in the Writings of St. Paul*, and in 1830 by a third *On the Errors of Romanism traced to their Origin in Human Nature.* He also published in 1829 a volume of his Halesworth sermons, under the title *A View of the Scripture Revelations concerning a Future State.* It was while he was at St. Alban Hall (1826) that the work appeared which is perhaps most closely associated with his name—his treatise on *Logic*, originally contributed to the *Encyclopædia Metropolitana.* By this work, which gave a great impetus to the study of logic not only in Oxford but throughout Great Britain, Whately has been known to generation after generation of students; and, though it is no longer so much in use, the qualities of the book make much of it as admirable now as when it was written. Whately swept the webs of scholasticism from the subject, and raised the study to a new level. A similar treatise on *Rhetoric*, also contributed to the *Encyclopædia*, appeared in 1828. In 1829 Whately was elected to the professorship of political economy at Oxford in succession to Senior. In writing to a friend he gives the following characteristic reason for accepting the appointment: "It seems to me that before long political economists of some sort will govern the world. Now the anti-Christians are striving hard to have this science to themselves, and to interweave it with their notions; and, if these efforts are not met, the rising generation will be at the mercy of these men." It was a subject admirably suited to his lucid, practical intellect; but his tenure of office was cut short by his appointment to the archbishopric of Dublin in 1831. He published only one course of *Introductory Lectures* (1831), in which he sought to establish the true scope of the science; but one of his first acts on going to Dublin was to endow a chair of political economy in Trinity College out of his private purse. Whately's appointment by Lord Grey to the see of Dublin came as a great surprise to everybody, for though a decided Liberal Whately had from the beginning stood aloof from all political parties, and ecclesiastically his position was that of an Ishmaelite fighting for his own hand. The evangelicals regarded him as a dangerous latitudinarian on the ground of his views on Catholic emancipation, the Sabbath question, the doctrine of election, and certain quasi-Sabellian opinions he was supposed to hold about the character and attributes of Christ, while his view of the church was diametrically opposed to that of the High Church party, and from the beginning he was the determined opponent of what was afterwards called the Tractarian movement. The appointment was challenged in the House of Lords, but without success. In Ireland it was immensely unpopular among the Protestants, both for the reasons just mentioned and as being the appointment of an Englishman and a Whig. Whately's blunt outspokenness and his "want of conciliating manners," which even his friends admit, prevented him from ever completely eradicating these prejudices; and the amount of opposition he met with from his own clergy would have daunted a man less resolute than the new archbishop in the performance of what he conceived to be his duty. He ran counter to their most cherished prejudices from the first by connecting himself prominently with the attempt to establish a national and unsectarian system of education. He enforced strict discipline in his diocese, where it had been long unknown; and he published an unanswerable, and all the more unpalatable, statement of his views on the Sabbath (*Thoughts on the Sabbath*, 1832). The archbishopric of Dublin at that time—just after the passing of the Catholic Emancipation Act, and in the midst of a general refusal to pay tithes—was anything but a bed of roses. Whately spoke of his appointment as "a call to the helm of a crazy ship in a storm," and one which nothing but an overpowering sense of duty could have induced him to accept. He took a small country place at Redesdale, four miles out of Dublin, where he could enjoy his favorite relaxation of gardening. Here his life was one of indefatigable industry. Questions of tithes, reform of the Irish Church, reform of the Irish Poor Laws, and, in particular, the organization of national education occupied much of his time. But he found leisure for the discussion of other public questions, for example, the subject of transportation and the general question of secondary punishments, in which he was strongly interested and on which he repeatedly published. In 1837 he wrote his well-known handbook of *Christian Evidences*, which was translated during his lifetime into more than a dozen languages. At a later period he also wrote, in a similar form, *Easy Lessons on Reasoning*, on *Morals*, on *Mind*, and on the *British Constitution.* He attached much importance himself to these unpretending but useful books. Among other works may be mentioned *Charges and Tracts* (1836), *Essays on some of the Dangers to Christian Faith* (1839), *The Kingdom of Christ* (1841). He also edited Bacon's *Essays*, Paley's *Evidences*, and Paley's *Moral Philosophy.* His cherished scheme of unsectarian religious instruction for Protestants and Catholics alike was carried out for a number of years with a measure of success, a selection of Scripture lessons and of Christian evidences by the archbishop himself being actually used in the model schools. But in 1852 the scheme broke down through the opposition of the new Catholic archbishop of Dublin, and Whately felt himself constrained to withdraw from the Education Board. This was felt by him as a grievous disappointment. From the beginning Whately was a keen-sighted observer of the condition of Ireland question, and gave much offence by openly supporting the state endowment of the Catholic clergy as a measure of justice. During the terrible years of 1846 and 1847 the archbishop and his family were unwearied in their efforts to alleviate the miseries of the people. Whately's private beneficence was not confined, however, to this period. Though so rigid a political economist that he could boast of never having given a penny to a beggar, his charities were princely, and oftenest bestowed without the knowledge of his nearest friends. From 1856 onwards symptoms of decline began to manifest themselves in a paralytic affection of the left side, which kept his arm in a constant tremor. In 1860 he lost his wife and a much-loved daughter. Still he continued the active discharge of his public duties till the summer of 1863, when he was prostrated by an ulcer in the leg, and after several months of acute suffering he died on 8th October, 1863. In the following year his daughter published *Miscellaneous Remains* from his commonplace book, and in 1866 his *Life and Correspondence* in two volumes. The loosely compiled *Anecdotal Memoirs of Archbishop Whately*, by W. J. Fitzpatrick (1865), may be used (with discretion) as enlivening Miss Whately's picture of her father.

Few eminent men have had more anecdotes and witty sayings attributed to them than Whately, He was a great talker, much addicted in early life to argument, in which he used others as instruments on which to hammer out his own views, and as he advanced in life much given to didactic monologue. But this didactic tendency was accompanied almost to the last by an intensely youthful delight in logic-chopping. At his monthly dinners to his clergy the archbishop would indulge even to an undignified extent in a species of logical horse-play. To this were added a keen wit, whose sharp edge often inflicted wounds never deliberately intended by the speaker, and a wholly uncontrollable love of punning. Whately often offended people by the extreme unconventionality of his manners. When at Oxford his white hat, rough white coat, and huge white dog earned for him the sobriquet of the White Bear, and he outraged the conventions of the place by exhibiting the exploits of his climbing dog in Christchurch Meadow. This free and easy manner clung to him in later life and accompanied him into the Dublin drawing-rooms, where it was often exaggerated by absence of mind. His fondness for dogs and animals generally was a passion through life, and he was also very fond of children, who, with their usual discrimination, gave him their confidence in return. He was an adept in various savage sports, more especially in throwing the boomerang.

Whately was a man loved and reverenced by a narrow circle, hated, or at least distrusted, by a much larger number. This was largely owing to his own intellectual characteristics; for, with a remarkably fair and lucid mind, his sympathies were narrow, and by his blunt outspokenness on points of difference he alienated many. With no mystical fibre in his own constitution, the Tractarian movement was incomprehensible to him, and was the object of his bitter dislike and contempt. The doctrines of the Low Church party seemed to him to be almost equally tinged with superstition. In short, it is admitted even by his admirers that he had a tendency to depreciate those minds which could not rest content with his own "common-sense" view of Christianity. Seeing so clearly himself, he could not believe that there might be things which he could not see. Though a great logician, there was nothing philosophical or speculative about his mind, and he took a practical, almost business-like, view of Christianity, which seemed to High Churchmen and Evangelicals alike little better than Rationalism. In this they did Whately less than justice, for his belief in Christianity as understood by himself was thoroughly genuine, and his religion was to him a real thing. But he may be said to have continued into our own times the typical Christianity of the 18th century—the Christianity of the theologians who went out to fight the Rationalists with their own weapons. It is to Whately essentially a belief in certain matters of fact, to be accepted or rejected after an examination of "evidences." Hence his endeavor always is to convince the logical faculty, and his Christianity inevitably appears as a thing of the intellect rather than of the heart. Whately himself was well aware that he was out of harmony with the general tendency of his time, and even Broad Church theology has in general proceeded since upon other lines than his. Nevertheless, though in no sense a fruitful or suggestive mind, his clear and massive intellect inspired general respect, and his books well repay reading by the shrewdness of their observation, the acuteness of the reasoning, the faculty of telling illustration, and the uniform excellence of style. Whately's qualities are exhibited at their best in his *Logic*, which is, as it were, the quintessence of the views which he afterwards applied to different subjects. He has written nothing better than the luminous Appendix to this work on "Ambiguous Terms." (A. SE.)

Structure of wheat plant.

WHEAT (*Triticum*), **the most important and the** most generally diffused of cereal grasses, is an annual plant, with hollow, erect, knotted stems, and produces, in addition to the direct developments from the seedling plant, secondary roots and secondary shoots (tillers) from the base. Its leaves have each a long sheath encircling the stem, and at the junction of the blade or "flag" with the sheath a small whitish outgrowth or "ligula." The inflorescence or ear consists of a central stalk bent zigzag, now to the one side, now to the other, thus forming a series of notches (see Fig. 1), and bearing a number of flattened spikelets, one of which grows out of each notch and has its inner or upper face pressed up against it. At the base of each spikelet are two empty boat-shaped glumes or "chaff-scales," one to the right, the other to the left, and then a series of flowers, 2 to 8 in number, closely crowded together; the uppermost are abortive or sterile—indeed, in some varieties only one or two of the flowers are fertile. Each flower consists of an outer or lower glume, called the flowering glume, of the same shape as the empty glume and terminating in a long, or it may be in a short, awn or "beard." On the other side of the flower and at a slightly higher level is the "palea," of thinner texture than the other glumes, with infolded margins and with two ribs or veins. These several glumes are closely applied one to the other so as to conceal and protect the ovary, and they only separate to allow of the passage of the empty anthers after fertilization. Within the pale are two minute, ovate, pointed, white membranous scales called "lodicles." These contain three stamens with thread-like filaments and oblong, two-lobed anthers. The stamens are placed round the base of the ovary, which is a rounded or oblong body, much smaller than the glumes, covered with down, and surmounted by two short styles, extending into feathery brush-like stigmas. The ripe fruit or grain, sometimes called the "berry," the matured state of the ovary and its contents, is oblong or ovoid, with a longitudinal furrow on one side. The ovary adheres firmly to the seed in the interior, so that

on examining a longitudinal section of the grain by the microscope the outer layer is seen to consist of epidermal cells, of which the uppermost are prolonged into short hairs to cover the apex of the grain. Two or three layers of cells inside the epidermis constitute the tissue of the ovary, and overlie somewhat similar layers which form the coats of the seed. Within these last is a layer of square cells larger and more regular in form than those on each side: these contain the gluten or nitrogenous matter upon which so much of the nutritive value of the seed depends. This thin layer of gluten cells contains the albumen or perisperm, which constitutes the great mass of the seed, being composed of numerous cells of irregular form and size filled with starch grains. These layers of cells become more or less dry and inseparable one from another, forming the substance known as "bran." At the lower end of the albumen, and placed obliquely, is the minute embryo-plant, which derives its nourishment in the first instance from the albumen; this is destined to form the future plant.

Origin and species.

Such in brief is the general structure of the wheat plant as we now know it. Of its principal variations mention will be made below. What was its origin is not known; and opinion has differed as to whether more than one species is involved or whether all the varieties now known may not have been originally derived from one. The prevalent opinion among botanists is that the wheat plant is nowhere found in a wild condition. Recently, however, M. Frédéric Houssay is alleged to have discovered the plant wild in the mountains to the east of Kurdistan; but the statement requires confirmation. Some of the species of the genus *Ægilops* (now referred to *Triticum* by Bentham and Hooker and by Haeckel) may possibly have been the sources of our cultivated forms, as they cross freely with wheats. Haeckel, the latest monographer of the genus, considers that there are three species. (1) *Triticum monococcum*, which undoubtedly grows wild in Greece and Mesopotamia, is cultivated in Spain and elsewhere, and was also cultivated by the aboriginal Swiss lake-dwellers, as well as at Hissarlik, as is shown by the grain[1] found in those localities. (2) *T. sativum* is the ordinary cultivated wheat, of which Haeckel recognizes three principal races, *spelta*, *dicoccum*, and *tenax*. Spelt wheats (see Fig. 2) were cultivated by the aboriginal Swiss, by the ancient Egyptians, and throughout the Roman empire. The variety *dicoccum* was also cultivated in prehistoric times, and is still grown in Southern Europe as a summer wheat and one suitable for starch making. Other sub-varieties of *T. tenax* are *compactum*, *turgidum*, and *durum* (see below). (3) The third species, *T. polonicum*, or Polish wheat, is a very distinct-looking form, with long leafy glumes; its origin is not known. As these varieties intercross with each other, the presumption is that they, like the species of *Ægilops*, which also intercross with wheat, may have all originated from one common stock.

Home and distribution.

Basing his conclusions upon philological data, such as the names of wheat in the oldest known languages, the writings of the most ancient historians, and the observations of botanical travellers, De Candolle infers that the original home of the wheat plant was in Mesopotamia, and that from thence its cultivation extended in very early times to the Canaries on the west and to China on the east. In the western hemisphere wheat was not known till the 16th century. Humboldt mentions that it was accidentally introduced into Mexico with rice brought from Spain by a negro slave belonging to Cortes, and the same writer saw at Quito the earthen vase in which a Flemish monk had introduced from Ghent the first wheat grown in South America.

Principal variations.

As might be anticipated from the cultivation of the plant from time immemorial and from its wide diffusion throughout the eastern hemisphere, the varieties of wheat—that is, of *T. sativum*—are very numerous and of every grade of intensity. Those cases in which the variation is most extreme some botanists would prefer to consider as forming distinct species; but others, as De Vilmorin, having regard to the general facts of the case and to the numerous intermediate gradations, look upon all the forms as derivatives from one. In illustration of this latter point it may be mentioned that not only do the several varieties run one into the other, but their chemical composition varies likewise according to climate and season. According to Prof. Church,[2] even in the produce of a single ear there may be 3 to 4 per cent. more of albuminoid matters in some grains than in others; but on the average the proportion of gluten to starch is as 9.11 to 100. From the point of view of agriculture (see vol. i. p. 315) it is generally of no great moment what rank be assigned to the various forms. It is only important to take cognizance of them for purposes of cultivation under varying circumstances. Hence we only allude to some of the principal variations and to those characteristics which are found to be unstable. (1) Setting aside differences of constitution, such as hardihood, size, and the like, there is relatively little variation in the form of the organs of vegetation. This indicates that less attention has been paid to the straw than to the grain, for it is certain that, were it desirable, a great range of variation might be induced in the foliage and straw. As it is, some varieties are hardier and taller than others, and the straw more solid, varying in color and having less liability to be "laid"; but in the matter of "tillering," or the production of side-shoots from the base of the stem, there is much difference. De Vilmorin points out that wheats of cold countries have flexible, thin, hollow straw, elongated fragile ears, and soft floury seeds; Hunter's wheat may be cited as a good example. Wheats of hotter countries have a more solid, rigid straw, the ears short, stout, compact, the glumes provided with long awns or beards, and the seed hard and horny. Spring wheats procured from northern latitudes mature more rapidly than those from temperate or hot climates, whilst the reverse is the case with autumn wheats from the same source. The difference is accounted for by the greater amount of light which the plants obtain in northern regions, and, especially, by its comparatively uninterrupted continuance during the growing period, when there are more working hours for the plants in the day than in more southern climes. Autumn wheats, on the other hand, are subjected to an enforced rest for a period of several months, and even when grown in milder climates remain quiescent for a longer period, and start into growth later in spring,—much later than varieties of southern origin. These latter, accustomed to the mild winters of those latitudes, begin to grow early in spring, and are in consequence liable to injury from spring frosts. Wheats of dry countries and of those exposed to severe winds have, says De Vilmorin, narrow leaves, pliant straw, bearded ears, and velvety chaff, — characteristics which enable them to resist wind and drought. Wheats of moist climates, on the other hand, have broader leaves, to admit of more rapid transpiration. No doubt careful microscopic scrutiny of the minute anatomy of the leaves of plants grown under various conditions would reveal further adaptations of structure to external conditions of climate. At any rate, it is certain that, as a general rule, the hard wheats are almost exclusively cultivated in hot, dry countries, the spelt wheats in mountainous districts and on poor soil, turgid wheats, like the Egyptian, in plains or in ill-drained valleys,—the best races of wheat being found on rich alluvial plains and in fertile valleys. The wheat used in the neighborhood of Florence for straw-plaiting is a variety with very slender stalks. The seed is sown very thickly at the beginning of winter and pulled, not cut, about the end of May, before the ear is ripe. In the United Kingdom ordinary wheat, such as old red Lammas and Chiddam's white, is used for straw-plaiting, the straw being cut some time before the berry ripens. The propensity to "tiller" is of the greatest importance, as it multiplies the resources of the farmer. An instance of this is given in the *Philosophical Transactions* (1768), where it is stated that one seedling plant in the Cambridge botanic garden was divided into eighteen parts, each of which was replanted and subsequently again divided, till it produced sixty-seven plants in one season. In March and April of the following year these were again divided and produced 500 plants, which in due time yielded 21,109 ears. (2) The variations in root-development have not been much attended to, although it would be well to study them in order to ascertain the degree of adaptability to various depths and conditions of soil. (3) A most important difference is observable in the liability to attacks of rust (*Puccinia*), some varieties being almost invariably free from it, while others are in particular localities so subject to it as to be not worth cultivating. (4) Velvet-chaffed wheats do best in poor soil, and bearded wheats are usually hardiest. (5) The ears vary, not only in size, but also in form, this latter characteristic being dependent on the degree of closeness with which the spikelets are set on. In such varieties as Talavera the spikelets are loose, while in the club and square-headed varieties they are closely packed. The form of the ear depends on the relative width of the anterior and posterior surfaces as compared with that of the lateral surfaces. In the square-headed varieties the lateral surfaces are nearly as wide as the median ones, owing to the form and arrangement of the spikelets. The number of abortive or sterile spikelets at the top of the ear also varies: in some cases nearly all the spikelets are fertile, while in others several of the uppermost ones are barren.

Classification of cultivated wheats.

The classification of the different varieties of cultivated wheat has occupied the attention of many botanists and agriculturists. The latest and fullest account is that of M. Henry de Vilmorin in his *Les Blés Meilleurs* (Paris, 1881). The classification adopted by this writer is based, in the first instance, on the nature of the ear: when mature its axis or stem remains unbroken, as in the true wheats, or it breaks into a number of joints, as in the spelt wheats. In the first class the ripe grain readily detaches itself from the chaff-scales, while in the spelts it is more or less adherent to them, or not readily separable from them. The true wheats are further subdivided into soft wheats, turgid wheats (*T. turgidum*), hard wheats (*T. durum*), and Polish wheats (*T. polonicum*). In the soft wheats the chaff-scales are boat-shaped, ovoid, of the consistence of parchment, and shorter than the spikelet; the seed is floury, opaque, white, and easily broken. In the turgid wheats the glumes have long awns, and the seed is turgid and floury, as in the soft wheats. In the hard wheats the outer glumes are keeled, sharply pointed, awned, and the seed is elongated and of hard glassy texture, somewhat translucent, and difficult to break owing to its toughness. These seeds are richer in nitrogen than the soft wheats, so that an approximate notion of the richness in albuminoids may be gained by simply inspecting the cut surface of the seed. The Polish wheat, rarely if ever cultivated in the United Kingdom, has very large lanceolate glumes, longer than the spikelet, and elongated glassy seeds. Further subdivisions are made, according to the presence or absence of awns (bearded and beardless wheats), the color of the ears (white, fawn-colored, or red), the texture of the ears (glabrous—*i.e.*, smooth—or downy), and the color of the seed or "berry." In the jointed or spelt wheats the distinctions lie in the presence of awns, the direction of the points of the glumes (straight, bent outwards, or turned inwards), the form of the ear as revealed on a cross section, and the entire or cleft palea. As illustrating the fact of the occasional instability of these variations, Prof. Church mentions that a single grain will be sometimes horny and partly opaque and soft, in which case its composition will correspond with its aspect. The division into spring wheat and winter wheat is an agricultural one solely. Any variety may be a spring or a winter wheat according to the time at which it is sown. In the summer wheats it may often be observed that the median florets do not fill out so fully as in the autumn wheats. Among the turgid wheats there is a frequent tendency in the spike to branch or become compound,—a tendency which is manifested to a less degree in other forms. The Egyptian or so-called "mummy" wheat is of this character, the lower part of the spike branching out into several subdivisions. This multiplication of the seed-bearing branches might at first sight be considered advantageous; but in practice the quality of the grain is found to be inferior, as if the force that should have been devoted to the maturation of the grain were, in a measure, diverted and expended in the production of additional branches to the spike.

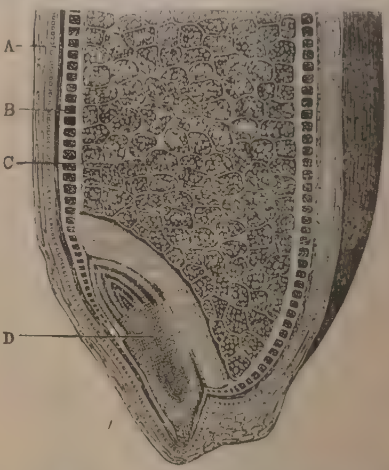

FIG. 3.—Longitudinal section of a grain of wheat; highly magnified. A. Epidermal cells. B. Cells containing gluten. C. Cells of perisperm or albumen, filled with starch. D. Embryo cut through the middle, root-end pointing downwards.

With regard to the chemical composition of the ripe grain, the Rothamsted experiments reveal a singular uniformity, even under very varied conditions of manuring and even where much diversity was apparent in the constitution of the straw. A high or low percentage of nitrogen in the grain was also shown to depend more directly on the degree of ripening, as influenced by the character of the season, than on difference in manure; but it depends more upon the variety than upon soil or nutrition.

Adaptability to soil and locality.

Apart from the botanical interest of these diversities, as indications of the faculty of variation in plants, and possibly as clues to the genealogy and origin of the cultivated plant, their practical importance is very great. Some varieties are suited to hot, others to cold countries; some will flourish on one description of soil, others on another. Hence the paramount importance of ascertaining by experiment, not only what are the best varieties, but which are the best adapted for particular localities and particular climatic conditions. Porion and Dehérain have shown[1] the "infinite superiority" over the ordinary wheats of a particular square-headed variety grown on rich soil in the north of France. A good selection of seed, according to the nature of the soil, demands, says De Vilmorin, intelligence and accurate knowledge on the part of the farmer. If a good variety be grown in poor soil, the result will be unprofitable, while, if bad wheat be grown on good soil, the result may be nil. In botanical collections there exist, it is stated, herbarium specimens or other evidences of plants grown in Norway as far north as lat. 65° (Schubeler), in Switzerland at an elevation of 1200 feet above the valley of Zermatt (or 6500 feet above the sea), near the straits of Magellan, as well as in Teneriffe, the Cape of Good Hope, Abyssinia, Rodriguez, the Philippine Islands, and the Malay Archipelago. These widely-separated localities show the great area over which the culture is possible, and illustrate the powers of adaptation of the plant. The requirements of the consumer have also to be considered: for some purposes the soft wheats, with their large relative proportion of starch, are the best, for others the hard wheats, with their larger quantity of gluten. With the modern processes of milling, the hard wheats are preferred, for they make the best flour; and in North America the spring wheats are, as a rule, harder than the winter wheats. The soft wheats are those which are most general in European cultivation, and, as a rule, the beardless varieties, though more tender, are preferred. The bearded varieties are supposed to be hardier; at any rate they defy the ravages of predatory birds more completely than the unarmed varieties, and they are preferable in countries liable to storms of wind, as less likely to have their seeds detached. Hard wheats are specially employed in Italy for the fabrication of macaroni. Polish wheat is used for similar purposes. Spelt wheats are grown in the colder mountainous districts of Europe; their flour is very fine, and is used especially for pastry-making; but, owing to the construction of the grain, it requires special machinery for grinding (see FLOUR).

---

[1] *Ann. Agronom.*, January, 1888, p. 33.

The following passage, reproduced from a German source in *Agricultural Science* (January, 1887), may serve still further to illustrate the fitness of particular varieties for special purposes.

> "Innumerable experiments have shown that the value of wheat for seed increases with the size of the grain; the larger kernel yields a stronger plant, and this will bear a heavier crop; the smaller grain contains the larger proportion of gluten, yields a better flour, and brings a higher price; but with the smaller yield per acre the profit may be less. The 'volume-weight' is dependent more on the well-rounded form of the grain than on its size; when about alike in respect to shape, the market value of the grain is closely proportionate to its weight per bushel. Grain of a higher specific gravity is usually richer in gluten. Richness in this constituent is of the greatest importance, as affecting the market value of the grain; it gives better baking qualities to the flour, besides a higher nutritive value, and is accompanied with greater richness in phosphate, also an important constituent of animal food. The proportion of gluten in wheat is determined largely by the climate, and especially by the proximity of the sea. Insular England produces a wheat grain with high absolute weight, but as a rule with less gluten than the wheat of eastern Europe. English wheat, and wheat in general grown in an ocean climate, seldom contains over ten per cent. of gluten, while in eastern Europe and in the western United States the proportion rises to twenty per cent. and above. Vigorous English seed wheat sown in eastern Europe yields larger crops than the native seed and a grain richer in gluten than the parent, though not so rich as wheat from native seed."[1]

It is, however, to be observed that proximity to the sea does not produce soft wheat poor in gluten in Italy, Algeria, and other warm and tropical regions, where the plant is cultivated quite as much under the influence of the sea as in England. The soft wheat of Great Britain is to be explained rather by the mildness of the climate and the relative constancy of the temperature.

Wheat begins to grow at the tempature of 5° C. (41°Fahr.); and, when the aggregate temperature, as represented by the sum of the daily means, has mounted up to 185° Fahr., the germ begins to escape from the husk, if the seed be not deeply buried; but if it is deeply buried, an amount of heat is required greater in proportion to the depth. If the seed lies at a depth lower than a foot from the surface, it rarely germinates. The seedling plant ceases to grow if the mean temperature of the day remains below 42° Fahr. When the young plants have been influenced by an aggregate temperature amounting to 1896° Fahr. from the period when sown, or 1715° from the period of germination, branching or "tillering" goes on freely, and the young ears are formed. Under the influence of a mean temperature of 55°, or a little above, the flowers are produced. A still higher daily mean is required for the full development and ripening of the grain. The figures here cited are given by Risler and are calculated for the climate of Paris; but, of course, the same principles apply in the case of other countries. The amount of light and of moisture has also to be taken into account. The fact that the wheat plant requires less water than other cereals, and therefore does not suffer so much from drought, is one of great importance to the cultivator, and furnishes one reason for the greater proportionate culture of wheat in the eastern than in the western counties of England.

As for the soil requirements, see AGRICULTURE, vol. i. p. 316 18. The following figures, cited by De Vilmorin from Joulie, will give an idea of the nature and amount of the demands made upon the soil by a wheat crop; in order to yield a crop of 44½ bushels of wheat to the acre, the soil must supply to the crop during its growth in round numbers—202 ℔ of nitrogen, 81 ℔ of phosphoric acid, 55 ℔ of lime, 26 ℔ of magnesia, and 255 ℔ of potash.

Production of varieties.

The numerous varieties of wheat now in cultivation have been obtained either by selection or by cross-breeding. In any wheat-field there may be observed on close inspection plants differing in character from the majority. If seeds of these "sporting" plants be taken and grown in another season, they may (or may not) reproduce the particular variation. If they do, and the same process of selection be continued, the variation becomes in time "fixed," though it is always more or less liable to revert to its original condition. By continuously and systematically selecting the best grains from the best ears, Major Hallett has succeeded in introducing "pedigree wheats" of fine quality. But even greater results may be expected from cross-breeding, or the fertilization of the flowers of one description of wheat by the pollen of another. This has been attempted by Shireff, Le Couteur, Maund, and others in the past, and more recently by H. de Vilmorin and Messrs. Carter. Under natural circumstances wheat is self-fertilized: that is to say, the pollen of any given flower impregnates the stigma and ovule of the same flower, the glumes and coverings of the flower being tightly pressed round the stamens and stigmas in such a way as to prevent the access of insects and to ensure the deposit of the pollen upon the stigmas of the same flower. This process of self-fertilization is the usual method, and no doubt keeps the variety true or unmixed; but the occasional presence of varieties in a wheat-field shows that cross-fertilization is sometimes secured. The stamens of the wheat plant may frequently be seen protruding beyond the glumes, and their position might lead to the inference that cross-fertilization was the rule; but on closer examination it will be found that the anthers are empty or nearly so, and that they are not protruded till after they have deposited the pollen upon the stigma. The separation of the glumes, which occurs at the time of fertilization, and which permits the egress of the useless stamens after that operation, is stated to occur only under certain conditions of temperature, when the heat, in fact, is sufficient to cause the lodicles of the flower to become turgid and thus to press apart the glumes. A temperature of about 75° Fahr. is found by Messrs. Carter to be the most favorable. From what has been said it will be evident that the artificial fertilization of wheat is a very delicate operation. The glumes have to be separated and the anthers cut away before the pollen is fully formed, care being taken at the same time not to injure the stigma, and specially not to introduce, on the scissors or otherwise, any pollen except that of the variety desired. De Vilmorin's experiments have shown that all the varieties will intercross, and that even such a distinct form as the Polish is no exception. From this he concludes that all the forms have originated from one stock and are to be comprised within one species. In the progeny of these crossed wheats especially in the second generation, much variation and difference of character is observable,—a phenomenon commonly noticed in the descendants from crosses and hybrids and styled by Naudin "irregular variation." Sometimes characteristics appear in the crossed wheats which are not found in the parent varieties, although they occur in other wheats. Thus, De Vilmorin records the presence of turgid wheats among seedlings raised from a soft wheat fertilized with the pollen of a hard variety, and spelt wheat among the descendants of a soft crossed with a turgid wheat. Other of De Vilmorin's experiments were made with the practical object of obtaining improved varieties or forms specially suitable to particular localities. Among those he has raised is one named "Dattel," which is highly esteemed; it was got from the red Chiddam, a valuable variety, but one in which the straw is defective. By crossing the red Chiddam with the pollen of Prince Albert a new variety has been produced which is stated to be early, very productive, and of good quality, as far as both grain and straw are concerned. Among many varieties raised by Messrs. Carter some are very interesting: in one case the seed-parent was a short-strawed, downy-chaffed, awnless variety, the pollen-parent a large bearded American wheat. The offspring exceeded the seed-parent in stature by a foot, and had a smooth chaff and stout thickset ears with minute awns. Some of the crosses were made with the view to secure denser production of awns and thus to render the ears "bird-proof"; others were devised with a view of securing an early ripening variety, which was effected by crossing with the Talavera, a known early variety. The progeny was ready for cutting (in the neighborhood of London) on 21st July, 1886.

To show how considerable may be the variations in the produce yielded by different varieties, the following figures, taken from the "memoranda sheet" of the Rothamsted experiments, may be cited. For twelve successive years (1871–1882) Sir John Lawes cultivated 26 varieties of wheat, each variety each year in a different field and under different conditions of manuring. From various circumstances satisfactory averages were obtained during only eight years (1871–1878). The mean produce of all the varieties taken together during that period was 43½ bushels (dressed corn) per acre; the lowest average produce was 36½ bushels per acre, furnished by Hallett's original red; and the highest produce was 53⅝ bushels per acre, yielded by Rivett's red. As to manuring, the highest mean produce (51¾ bushels per acre) from 25 varieties taken together was obtained in 1878 on a field where all the 25 varieties were manured with 2 cwts. of nitrate of soda, the previous crop having been turnips, for which farmyard dung was applied, the turnips being partly consumed on the land, partly removed. Here again Rivett's red furnished the best crop (66⅝ bushels per acre). This variety in almost—but not in all—cases gave the highest produce. The lowest mean produce from all the varieties taken together was 21¼ bushels per acre in 1879,—a most disastrous season. In that year even Rivett's red furnished no more than 16 bushels per acre, among the lowest on the record, but nearly twice as much as red Rostock, which in the same year yielded only 8½ bushels per acre, the manuring consisting of 2 cwts. of nitrate of soda after clover, partly cut, partly "fed." This same variety in another year and under a different condition of manuring yielded 57 bushels per acre. The disastrous effect of the season of 1879 was manifested not only in diminished produce but in lessened germinative power; in the season following white wheats appear to have been the worst, the most satisfactory crop in 1880 being yielded by Webb's "challenge," seeds of which were received direct from Stourbridge and not grown on the Rothamsted farm, as in the case of the other varieties. As to the weight per bushel of the grains of the different varieties at Rothamsted, there was a more limited range than in the case of the absolute weight, the highest mean (63⅛ ℔ per bushel) being yielded by the "red nursery" variety, the lowest by Rivett's red (58¾), the general average of all the varieties amounting to 61¼ ℔ per bushel. The effect of the bad season of 1879 was also shown here: the general average in that year was only 53½ ℔ per bushel, while in 1876 it was 63½ for the same varieties. The greatest weight per bushel does not therefore correspond in all cases with the absolute amount of crop per acre, for a small crop often yields grain of relatively heavy weight. Nor does the same condition of manuring that brings an abundant crop necessarily yield a proportionate return calculated in weight per bushel. The greatest weight per bushel (63½ ℔ in 1876) was secured on the same plot which in the same year yielded less than an average crop, 42½ bushels per acre, very little difference being observable in the different varieties in point of quality, though much in quantity. The lowest average weight per bushel (56¾ ℔), however, corresponded with a very low total produce, 23⅛ bushels per acre in 1880, on a poorly manured plot. These figures, added to those representing the cost for rent and taxes, manure, labor, and expenses of production generally, and considered in connection with the enormous supplies imported from abroad, will show how great are the risks attendant upon wheat cultivation in the United Kingdom under existing circumstances; but of course they are of little value as regards the growth of wheat in India and the colonies.

Yield of different varieties.

The production of wheat, with the use of wheat bread, has increased enormously since the extension of railways has made possible the transportation of grain for great distances by land. The annual crop of the world is now estimated at nearly two thousand millions of bushels. Of late years the increase of production has been most notable in southern Russia, Australia, India, and North America.[1]

Wheat for fodder.

Wheat is sometimes grown as a forage crop. A variety has been introduced from Japan by Messrs. Sutton which seems to be very useful for this purpose. Although it takes a longer time to mature its seed, it flowers a fortnight earlier than other varieties. It seems also to be a hardy plant, having withstood successfully eight degrees of frost. From a crop sown on 27th August, a sample was cut on the following 13th October, with a stem more than 2 feet in length and very thick and succulent, and the autumn was not very genial. This variety tillers well, so that it makes a complete mass of green stuff, which is very serviceable either for feeding sheep or for "soiling." (M. T. M.)

INSECTS, ETC., INJURIOUS TO WHEAT.

It will be convenient to arrange the insects injurious to wheat under the natural orders to which they belong, and afterwards to describe one or two other forms of animal life, such as the myriapod, *Polydesmus*, and the nematode worm which causes the ear-cockle, for, although these are not insects, they must be taken into account in any description of the animal pests of the wheat crop.

The order *Orthoptera* contains the mole cricket, *Gryllotalpa vulgaris*, one of the largest insects found in Great Britain. It is 2 inches or a little more in length, of a brownish color, and covered over by velvety hairs; it is easily recognized by the peculiar character of its anterior legs, which are very strong and short and laterally compressed. These insects lead a subterranean life, burrowing through loose sandy soil by means of their fore limbs, which are structurally well adapted for digging. The sexes pair about the middle of June, and the female lays from 200 to 400 eggs in an oval chamber excavated some inches below the level of the ground. After laying her eggs, she does not, as is very generally the case amongst insects, die, but lives to keep guard over the eggs and the young larvæ, which appear in about three weeks; many of the latter, however, she eats. The young larvæ at first resemble black ants; they are very voracious and feed upon the young tender rootlets of corn and other plants. The adults prefer an animal diet, but do great damage by cutting through any roots which they encounter in their subterranean burrowings, and as these are winding and extensive considerable injury is caused to the crops. One of the natural enemies of mole crickets is the mole, which devours them readily; they are also eaten by those birds which scratch the soil for worms. They appear to be very sensitive to smell, and a dressing of a quart of paraffin oil to 1 cwt. of ashes or mould, or watering with solutions of quassia and soft soap, will often rid the field of them.

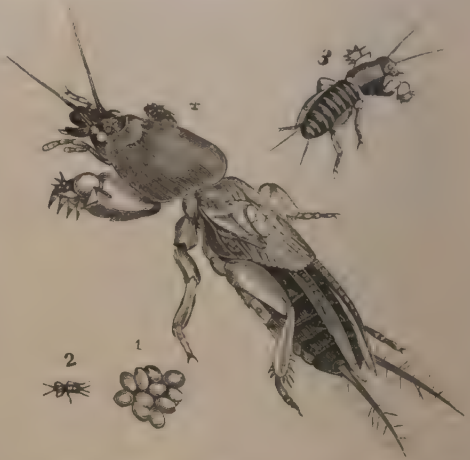

FIG. 1.—Mole cricket. 1, Eggs; 2, larva; 3, larva after first moult; 4, adult. Natural size.

The corn thrips, *Thrips cerealium*, is a member of the order *Thysanoptera*, which is by some authorities associated with the *Orthoptera*. It is a minute insect about 2 mm. long, with a black and brown coloration. The male is wingless; the female bears four long narrow wings fringed with long hairs. The antennæ are eight-jointed. The legs terminate in characteristic swellings; there are no claws. The insects are very active. The larvæ are whitish yellow, with bright red eyes, and acquire their wings after the fourth casting of the skin. The damage done to corn crops by these minute insects is often very serious; they secrete themselves under the paleæ surrounding the seed, and feed upon the soft juices of the latter. In addition to this, they sometimes cause injury to the plant by attacking the stalk whilst it is soft and full of sap. Owing to their very small size it is exceedingly difficult to devise means for getting rid of them; much

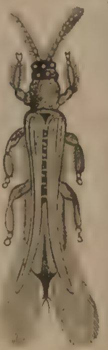

FIG. 2.–Corn thrips (*Thrips cerealium*), female; magnified.

---

[1] For a discussion of the methods of production followed in the United States, as well as in Canada, and for the chemical composition, trade, milling, and statistics of wheat, see Brewer, "Production of Cereals," in *Report* to tenth census of United States, vol. iii.

may be done, however, to prevent their appearance by keeping the land clean and free from weeds, which harbor them, and by destroying all refuse in which they may breed, and ploughing in the stubble to a considerable depth.

The most injurious form amongst the *Hemiptera* is *Siphonophora granaria* (*Aphis granaria*, Kirby); it attacks wheat chiefly in England, but is also found upon oats, barley, and rye. The young *Aphides* attack the leaf blades whilst young and tender, and when the ear begins to appear it is covered with numbers of these insects in every stage of development, from the young larva to the perfect insect. The larvæ are of a green or dark green color, with brown antennæ and yellow and black legs. The female, which produces the young viviparously, has a green abdomen, bearing two horns posteriorly; the rest of the body is brownish green, the legs black and yellow, the eyes red. The winged females, which appear late in the season, lay eggs; but whether these eggs serve to carry the species over the winter, or whether this is done by hibernating larvæ, is not definitely known. Both larvæ and females producing them have been found amongst the roots of the wheat plant during the winter. This *Aphis* is known to occur upon several of the common grasses of England; hence any grasses growing in a wheat field should be destroyed as much as possible when the pest is in the neighborhood. Deep ploughing and rotation of crops may also be recommended. In cases where the insects are noticed at an early stage, a dressing of soot or gas lime will serve to check them. Their numbers are kept down by lady-birds (*Coccinella*), which should never be killed, and also by two species of ichneumons (*Aphidius avenæ* and *Ephedrus plagiator*), which lay their eggs in the body of the *Aphides*.

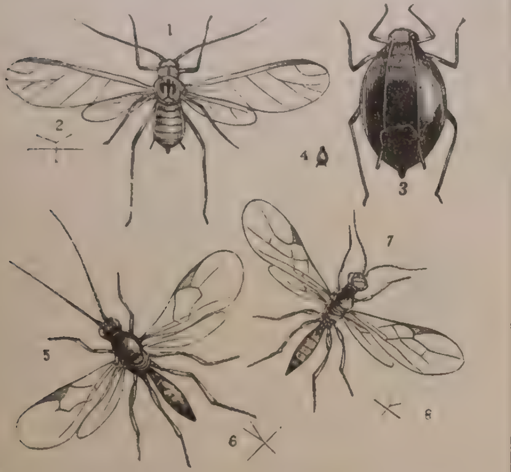

FIG. 3.—1, *Siphonophora granaria*, winged *Aphis*; 2, natural size of same; 3, wingless form; 4, natural size of same; 5, *Aphidius avenæ*; 6, natural size of same; 7, *Ephedrus plagiator*; 8, natural size of same.

The order *Diptera* includes several insects which are very harmful to corn crops. The frit fly, *Oscinis vastator*, is a very active small fly, with a greenish black metallic lustre, about 2 to 3 mm. in length. The larvæ are yellow or light brown, pointed anteriorly. The flies emerge from the chrysalis about April, and the female deposits her little red eggs upon the under surface of the leaf of the wheat; the larva when it is hatched creeps down and bores its way into the terminal bud of the plant, thus arresting all growth of the ear. The larva assumes the chrysalis state inside one of the outermost leaf sheaths. There are believed to be two broods each year. If, as seems probable, the pupæ pass the winter amongst the stubble or grass weeds, it is important that these should either be burnt or ploughed deeply in.

Two closely allied species of flies also attack corn crops; they are *Chlorops tæniopus* and *Chlorops lineata*. The former is of a light straw color, with three longitudinal dark stripes, and a greenish black abdomen; the antennæ are black, the eyes greenish; and the dark feet have a stripe of lighter color. It is about 3 to 4 mm. long. The injury to the crops is caused by the fly laying its eggs between the leaves of the young plant; the larvæ which hatch out from these bore their way down the stem from the base of the ear to the first joint, and there they form swellings known to the farmer as the "gout." The ear is aborted or misformed. The dampest part of the field is most subject to attack. *Ch. lineata* is about 2 mm. long; the antennæ have their two proximal joints yellow, whilst the third is black on its outer side; in its habits this insect resembles *Ch. tæniopus*, but attacks chiefly barley crops.

The daddy long-legs, *Tipula oleracea*, causes great damage to corn and other crops by the larvæ gnawing the young plants whilst they are still below the level of the ground. The female deposits her eggs in the ground, or near it in some grass, etc., choosing as damp a place as possible. The larva is provided with a very tough skin and may measure 1½ inches in length. It is apodal, and bores its way beneath the surface of the earth by alternately contracting and expanding. It assumes the pupal condition during the later half of the summer. The pupæ are provided with backwardly directed spines, by means of which they raise themselves above the level of the ground. As a means of preservation against this pest, ditches, and other damp places should be cleaned out. Rooks, which devour the larvæ at a great rate, should be encouraged; and deep ploughing to bury the eggs and the larvæ should be practiced, and the land dressed with some such poisonous substance as gas lime before breaking up.

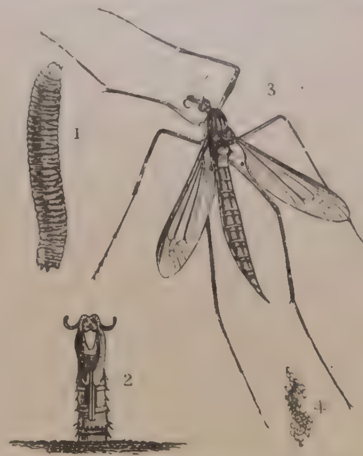

FIG. 4.—Daddy long-legs (*Tipula oleracea*). 1, Larva; 2, pupa case; 3, insect, natural size; 4, eggs.

Two species of *Cecidomyia* are most destructive to wheat. *Cecidomyia tritici*, the wheat midge, has been known in Great Britain for over a century. This fly is a little over 2 mm. in length, of an orange yellow color, with black eyes; the female is provided with a long ovipositor, by means of which it deposits ten or more eggs in the ears of wheat. The larvæ hatch out in about ten days. They are at first transparent, but become yellow, and their color gradually deepens. Most of the larvæ fall off the plant and bury themselves in the ground, where they change into pupæ; some, however, remain in the ear and are found in some numbers in chaff. The perfect insect emerges from the pupa in the spring. It is probable that more than one brood is produced during the season. The damage caused to the crop is due to the larva feeding upon the soft tissue of the ear and thus causing the seed to be imperfect; some authorities state that it also devours the pollen. Since the larvæ exist in chaff, great care must be taken that this does not prove a source of infection, and land which has been badly affected must be ploughed deep, in order to bury them. *C. destructor* is well known under the name of the Hessian fly. It was first noticed in Great Britain during the summer of 1886, in Hertfordshire, and within a few months its presence was reported throughout the eastern half of England and Scotland,—a circumstance which led some authorities to believe that it had existed in Great Britain for some little time; there has been, however, no definite proof of this. The fly has been known in North America since 1776, where

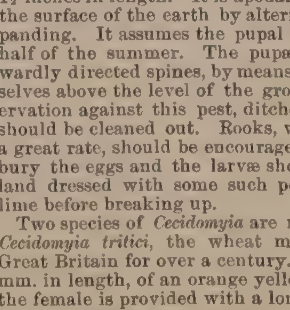

FIG. 5.—Hessian fly (*Cecidomyia destructor*). 1, Insect; 2, larva; 3, pupa or "flax seed." All magnified.

it has done very extensive damage, especially during warm moist summers. It is known to occur throughout central Europe; in 1879 it made its appearance in Russia, and in four years had spread over the greater part of that country. The female fly is about 3 mm. long, brownish in color, but becoming black in the thorax and head. The wings are fringed, rounded at their ends, and the third nerve is branched. The antennæ are also fringed and consist of two globular basal joints and 14 to 16 smaller joints, which diminish in length towards the ends. The male fly is smaller than the female; the abdomen terminates in two claspers. The female lays in the spring 40 or more eggs upon the leaves of the corn plants,—wheat, barley, and rye; oats are not affected. The larvæ are hatched in about 5 or 6 days, and make their way down to the axils of the leaves, feeding upon the sap which is passing up the stem. After a few weeks they are transformed into the "flax seed" pupæ, which are usually found just above the second joint of the stem. From these pupæ the autumn brood of flies emerge; these lay eggs, and their larvæ tide over the winter in the pupal condition. Sometimes only one brood is produced in the year. The injury done to the plant by the larvæ living upon the sap usually causes the infected plants to bend over just above the second joint; this renders them easily distinguishable from the healthy plants. The numbers of this most injurious insect are fortunately kept down to a considerable extent by parasites. Five species of *Chalcididæ* are known to be parasitic on *C. destructor* in America and six in Russia. Fortunately these are not absent in Great Britain. When a crop has been infected by this pest, the corn should be reaped above the second joint, and the stubble carefully ploughed in. A sharp look-out should be kept for the appearance of the "flax seed" both in the plant and in samples of corn, especially if the latter has been badly cleaned. Some species of wheat seem to have a greater power of resisting the attacks of this insect than others, but as yet very little definite information can be given on this point. These two pests do damage to the amount of millions of pounds every year in North America; but none of those mentioned before them are either common or destructive on that continent.

Cephus pygmæus belongs to that destructive group of the *Hymenoptera*, the saw-flies, and is commonly known as the corn saw-fly. The insect is black in color, with a large head and prominent eyes. The mouth parts are yellow, and in the male the legs are the same color. The female is darker and has its black ovipositor slightly exposed. Whilst the wheat is still young and tender, the female pierces the stalk below the forming ear and there deposits an egg. The larva, which hatches out in about ten days, is when full-grown about half an inch long, whitish in color, with a brown head. It differs from the ordinary saw-fly larva in having but three pairs of legs. This larva bores its way down the stem, cutting through the knots, and about harvest time it cuts the stem nearly through at its base. The larva assumes the pupal stage in the lowest part of the stem and remains in this condition till the following spring, when the perfect insect emerges. Plants which have been affected by this insect can easily be recognized by their thin empty ears. Since the insect passes the winter in the stubble, every effort should be made to destroy this wherever the disease has been prevalent.

The caterpillars of some species of *Lepidoptera* do considerable damage to corn crops. On the Continent the larvæ of *Agrotis clavis* (*segetum*) devour the roots of wheat and are especially destructive to autumn-sown crops. *Tinea granella*, a member of the family *Tineidæ*, causes much harm to grain in store. This small moth, of a dusky white color, lays one or two minute eggs upon each grain; as soon as they are hatched, the caterpillars bore their way into the grain, and by means of a web bind several grains together. Through these it bores minute passages and lives in them, devouring the substance of the grain. The larvæ ultimately withdraw to the angles and corners of the granary; hence, wherever this pest is prevalent, care must be taken to keep the building free from dust, cobwebs, etc. There is a member of the *Coleoptera* which is frequently mistaken for the above-mentioned pest. This beetle is known as *Trogosita mauritanica;* it is supposed to have been introduced from Africa. The larva is ¾ inch long, with a whitish body, bearing tufts of hairs and a brown head. It gnaws the corn grains and lives on their contents. The beetle is carnivorous, and is said to compensate for the damage its larva causes by devouring the above-mentioned *Tinea granella*.

Another beetle, *Calandra granaria*, the corn weevil, also attacks stored grain. The eggs are deposited in the grains of corn and the larva spends its life therein, living upon the substance of the grain, and ultimately turning to a pupa. It leaves the grain first upon attaining the mature state.

The larvæ of *Elater* (*Agriotes*) *lineatus* and of other species of this genus are amongst the most destructive insects known to agriculturists. They are commonly known as wire-worms from the exceedingly tough character of their skins. The mature beetles are known as skip-jacks, from the power they possess of regaining their normal position when placed on their back by means of a loose articulation between the pro-thorax and the meso-thorax. This when put in action causes the beetle to jump into the air, and they usually fall on their feet. The wire-worms have a rather flattened body, yellowish brown in color; it consists of twelve segments, and bears three pairs of legs. The larvæ live for several years, and then, burying themselves deep in the earth, emerge as the perfect insect in about a fortnight. The beetles pair in June, and the female deposits her eggs upon blades of grass or the sheathing leaves of corn. The best preventative for this pest is clean farming and scarifying the land after harvest, so as to kill all roots which might serve as food for the wire-worms. When a crop is badly attacked, soot or gas lime may be applied and the land well rolled to compress the earth. The numbers of the larvæ are to some extent kept down by moles and insectivorous birds.

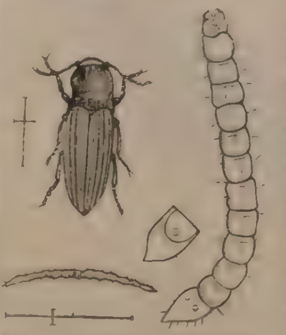

FIG. 6.—Wire-worm (*Elater lineatus*), showing insect and larva.

The cockchafer, *Melolontha vulgaris*, is injurious to corn crops, in both its mature and its larval condition. During the former state it devours the leaves of wheat and of most other grasses, trees, and shrubs. The larva, which is very voracious, lives upon roots. This larva is very thick and fleshy, of a whitish hue, with three pairs of legs; it usually lies in a curled-up position. The larval condition lasts several years; but ultimately the larvæ become pupæ, and in this condition live through the winter. Much may be done to prevent the spread of this pest by shaking the cockchafers from the trees, amongst the leaves of which they hang, and destroying them. They are eagerly eaten by pigs and poultry.

An allied but much smaller species of beetle, *Anisoplia horticola*, with much the same habits as the above, also occurs in England, and attacks wheat and grass crops.

Millepedes, although they are not insects, but one of the groups which compose the larger division *Tracheata*, must be included in an account of the pests which attack wheat. The English species which is most destructive to wheat, barley, and oats is *Polydesmus complanatus*. Millepedes pass their life underground, and are sometimes mistaken for wire-worms, but can be at once distinguished by the great number of their legs. They affect damp places, which should be drained, and no rubbish or litter should be left lying about.

Ear-cockle is due to the parasitism of a small white nematoid worm, known variously as *Anguillula* (*Vibrio*) *tritici* or *Tylenchus scandens* or *tritici*. These worms cause the formation of a brownish black gall upon the wheat ear. When the ear ripens and falls to the ground, the nematodes escape from the gall and live in the damp earth. Ultimately they make their way on to a young plant, and, as the ear forms, they pass into it and pair inside the gall which has been caused by their presence. The female lays numerous eggs, from which young nematodes hatch out, until the gall is quite full of them. As long as the gall remains hard, the larvæ are motionless; but they become active in moisture, and develop into the adult state. If the surrounding conditions are unfavorable they will remain in the larval state for years. They are capable of resisting great extremes of heat and cold, and are apparently unaffected by many poisons. Allied species affect the roots of wheat, grasses, and other plants.

For fungoid diseases, see FUNGUS, vol. ix. pp. 728–734, and MILDEW, vol. xvi. p. 306. (A. E. S.)

WHEATEAR, as a bird's name perhaps of doubtful meaning,[1] though Taylor, the "water poet" (d.

---

[1] The vulgar supposition of its being an euphemism of an Anglo-Saxon name (*cf.* Bennett's ed. of White's *Nat. Hist. Selborne*, p. 69, note) must be rejected until evidence that such a name ever existed be adduced. It is true that "Whittaile" (*cf.* Dutch *Witstaart* and French *Culblanc*) is given by Cotgrave in 1611, but the older names, according to Turner, in 1544, of "Clotburd"

1654), in whose writings it seems first to occur, and Willughby explain it (in the words of Ray, the latter's translator) as given "because [in] the time of wheat harvest they wax very fat." It would seem also from this author to have been originally the local name for the species in Sussex, on the South Downs of which county its capture in a very simple kind of trap has been the occupation of many generations of shepherds, who thereby have made an excellent trade, since Wheatears in their proper season, from the end of July till towards the end of September, are justly esteemed for the table and fetch a price that for many years has been continually rising, owing to the failing supply, which is chiefly due to the bringing under tillage of so much of the sheep-walk, heath, down, and other open country that was formerly in a natural condition.

The Wheatear, the *Saxicola œnanthe* of ornithologists, is one of the earliest migrants of its kind to return to its home, often reaching England at the end of February and almost always by the middle of March. The cock bird, with his bluish gray back and light buff breast, set off by black ear-coverts, wings, and part of the tail, is rendered still more conspicuous by his white rump as he takes short flights in front of those who disturb him, while his sprightly actions and gay song harmonize so well with his delicately-tinted plumage as to render him a welcome object to all who delight in free and open country. When alarmed both sexes have a sharp monosyllabic note that sounds like *chat*; and this has not only entered into some of the local names of this species and of its allies, but has caused all to be frequently spoken of as "Chats." The nest is constantly placed under ground; the bird takes advantage of the hole of some other animal, or the shelter of a clod in a fallowfield, or a recess beneath a rock. A large amount of soft materials is therein collected, and on them from 5 to 8 pale blue eggs are laid. The Wheatear has a very wide range throughout the Old World, extending in summer far within the Arctic Circle, from Norway to the Lena and Yana valleys, while it winters in Africa beyond the Equator, and in India. But it also breeds regularly in Greenland and some parts of North America. Its reaching the former and the eastern coast of the latter, as well as the Bermudas, may possibly be explained by the drifting of individuals from Iceland; but far more interesting is the fact of its continued seasonal appearance in Alaska without ever showing itself in British Columbia or California, and without ever having been observed in Kamchatka, Japan, or China, though it is a summer resident in the Tchuktchi peninsula. Hence it would seem as though its annual flights across Behring's Strait must be in connection with a migratory movement that passes to the north and west of the Stanovoi range of mountains, for Mr. Nelson's suggestion (*Cruise of the Corwen*, pp. 59, 60) of a northwest passage from Boothia Felix, where Ross observed it, is less likely.[1]

More than 60 other species more or less allied to the Wheatear have been described,[2] but probably so many do not really exist. Some 8 are included in the European fauna; but the majority are inhabitants of Africa. Several of them are birds of the desert; and here it may be remarked that, while most of these exhibit the sand-colored tints so commonly found in animals of like habitat, a few assume a black plumage, which, as explained by Canon Tristram, is equally protective, since it assimilates them to the deep shadows cast by projecting stones and other inequalities of the surface.

Of other genera closely allied to, and by some writers included in, *Saxicola* there is only need here to mention *Pratincola*, which comprises among others two well-known British birds, the Stonechat and Whinchat, *P. rubicola* and *P. rubetra*, the latter a summer-migrant, while the former is resident as a species, and the black head, ruddy breast, and white collar and wing-spot of the cock render him a conspicuous object on almost every furze-grown common or heath in the British Islands, as he sits on a projecting twig or flits from bush to bush. This bird has a wide range in Europe, and several other species, more or less resembling it, inhabit South Africa, Madagascar, Réunion, and Asia, from some of the islands of the Indian Archipelago to Japan. The Whinchat, on the other hand, much more affects enclosed lands, and with a wide range has no very near ally.

Placed near these forms by nearly all systematists is the group containing the Australian genus *Petrœca*, containing about a dozen species,—the "Robins," so called of the colonists, some of them remarkable for their bright plumage; and possibly allied to them, as indeed is generally thought, with 5 or 6 species peculiar to New Zealand, are the genera *Miro* and *Myiomoira*. But Prof. Parker has seen in the osteology of the first inferior characters which appear to him to separate them from their presumed colleagues, and as stated before (ORNITHOLOGY, vol. xviii. p. 51), he terms them "Struthious Warblers." Like so many other forms from the same countries, they probably preserve the more generalized structure of earlier and lower types, and should possibly be distinguished as a separate sub-family *Petrœcinæ*.

All the birds mentioned in this article form the group *Saxicolinæ* of most authors. Some, however, have raised them to the rank of a distinct Family *Saxicolidæ* (*cf.* WARBLER); and Mr. Sharpe (*Cat. Birds Brit. Mus.*, iv. pp. 164–199) has placed *Petrœca* and *Pratincola* in the Family *Muscicapidæ*. (A. N.)

WHEATLEY, FRANCIS (1747–1801), English portrait and landscape painter, was born in 1747 at Wild Court, Covent Garden, London. He studied at Shipley's drawing-school and the Royal Academy, and won several prizes from the Society of Arts. He assisted in the decoration of Vauxhall, and aided Mortimer in painting a ceiling for Lord Melbourne at Brocket Hall (Hertfordshire). In youth his life was irregular and dissipated. He eloped to Ireland with the wife of Gresse, a brother artist, and established himself in Dublin as a portrait-painter, executing, among other works, an interior of the Irish House of Commons. His scene from the London Riots of 1780 was admirably engraved by Heath. He painted several subjects for Boydell's *Shakespeare Gallery*, designed illustrations to Bell's edition of the poets, and practiced to some small extent as an etcher and mezzotint-engraver. It is, however, as a painter, in both oil and water-color, of landscapes and rustic subjects that Wheatley will be most favorably remembered. His work in these departments is graceful and pleasing, but lacks force and the impress of reality. He was elected an associate of the Royal Academy in 1790, and an academician in the following year. He died on 28th June, 1801. His wife, afterwards Mrs. Pope, was known as a painter of flowers and portraits.

WHEATON, HENRY (1785–1848), American lawyer and diplomatist, was born at Providence, Rhode Island, on 27th November, 1785. He graduated at Brown university in 1802, was admitted to the bar in 1805, and, after two years' study abroad, practiced law at Providence (1807–12) and at New York city (1812–25). He was a justice of the Marine Court of the city of New York from 1815 to 1819, and reporter of the United States Supreme Court from 1816 to 1827, aiding in 1825 in the revision of the laws of New York. His diplomatic career began in 1827, with an appointment to Denmark as chargé d'affaires, followed by that of minister to Prussia, 1835 to 1846. During this period he had published a *Digest of the Law of Maritime Captures* (1815); twelve volumes of *Supreme Court Reports*, and a *Digest*; a great number of historical articles, and some collected works; *Elements of International Law* (1836); *Histoire du Progrès du Droit des Gens en Europe* (1841), translated in 1845 by William B. Lawrence as a *History of the Law of Nations in Europe and America*; and the *Right of Visitation and Search* (1842). The *History* took at once the rank which it has always held, that of the leading work on the subject of which it treats.[3] Wheaton's general theory is that international law consists of "those rules of conduct which reason deduces, as consonant to justice, from the nature of the society existing among independent nations, with such

---

(=Clod-bird) and Smatch (=Chat) do not favor the usual derivation. "Fallow-chat" is another old name still locally in use, as is "Coney-chuck."

[1] On this subject see also Dr. Stejneger's observations in his "Ornithological Exploration of Kamtschatka," in *Bull. U. S. Nat. Museum*, No. 29, pp 349–351, and those of Prof. Palmén, *Vega-Exped. Vetenskapl. Iakttagelser*, v. pp. 260-262.

[2] *Cf.* the monograph of Messrs. Blanford and Dresser, in *Proc. Zool. Society*, 1874, pp. 213–241.

[3] See Davis's *Outlines of International Law*, 26, and Woolsey's *International Law* (Index, under Wheaton).

definitions and modifications as may be established by general consent." The publication of a second translation by Dana in 1866 led to a prolonged lawsuit between him and Lawrence. In 1846 Wheaton, who was more than sixty years of age, was requested to resign by the new president, Polk, who needed his place for another appointment. The request provoked general condemnation; but Wheaton resigned and returned to the United States. He was called at once to Harvard College as lecturer on international law; but he died at Dorchester, Massachusetts, on 11th March, 1848.[1]

WHEATSTONE, SIR CHARLES (1802–1875), the practical founder of modern telegraphy,[2] was born at Gloucester in February, 1802, his father being a music-seller in that city. In 1806 the family removed to London. Wheatstone's education was carried on in several private schools, at which he appears to have displayed no remarkable attainments, being mainly characterized by a morbid shyness and sensitiveness that prevented him from making friends. About 1816 he was sent to his uncle, a musical instrument maker in the Strand, to learn the trade; but with his father's countenance he spent more time in reading books of all kinds than at work. For some years he continued making experiments in acoustics, following out his own ideas and devising many beautiful and ingenious arrangements. Of these the "acoucryptophone" was one of the most elegant—a light box, shaped like an ancient lyre and suspended by a metallic wire from a piano in the room above. When the instrument was played, the vibrations were transmitted silently, and became audible in the lyre, which thus appeared to play of itself. On the death of his uncle in 1823 Wheatstone and his brother took up the business; but Charles never seems to have taken a very active part in it, and he virtually retired after six years, devoting himself to experimental research, at first chiefly with regard to sound. In 1823 he published his first paper, "New Experiments on Sound," in Thomson's *Annals of Philosophy*, and was greatly encouraged by the appreciative translations which appeared in several continental journals. Wheatstone's shyness still clung to him; for, although he occasionally read a paper to scientific societies when a young man, he never could become a lecturer. Hence many of his investigations were first described by Faraday in his Friday evening discourses at the Royal Institution. By 1834 Wheatstone's originality and resource in experiment were fully recognized, and he was appointed professor of experimental philosophy at King's College, London, in that year. This appointment was inaugurated by two events—a course of eight lectures on sound, which proved no success and was not repeated, and the determinations by means of a revolving mirror of the speed of electric discharge in conductors, a piece of work leading to enormously important results. The great velocity of electrical transmission suggested the possibility of utilizing it for sending messages; and, after many experiments and the practical advice and business-like co-operation of Cooke, a patent for an electric telegraph was taken out in their joint names in 1837. Wheatstone's early training in making musical instruments now bore rich fruit in the continuous designing of new instruments and pieces of mechanism. His life was uneventful except in so far as the variety of his work lent it color. He became a fellow of the Royal Society in 1837; in 1847 he married; and in 1868, after the completion of his masterpiece, the automatic telegraph, he was knighted. While in Paris perfecting a receiving instrument for submarine cables, Sir Charles Wheatstone caught cold, and died on 19th October, 1875.

Wheatstone was enthusiastic in his work; and, in spite of the invincible repugnance to public speaking, he could explain his machines and describe results to his friends with animation and remarkable clearness. Owing to the cast of his mind he could only undertake work with some distinct end or definite application in view; hence he applied himself chiefly to the useful embodiment of scientific principles, and to researches designed to throw light on such subjects as the interference of mental impressions with the evidence of the senses. As a natural consequence of the nervous enthusiasm which possessed him, several researches which had been commenced, and sometimes carried to a considerable distance, were relinquished as new sources of interest presented themselves, and remained unfinished at his death. Many of his ideas were expanded and appropriated by other workers, more persevering, if less original, who carried them into effect. Wheatstone's physical investigations are described in more than thirty-six papers in various scientific journals, the more important being in the *Philosophical Transactions*, the *Proceedings of the Royal Society*, the *Comptes Rendus*, and the British Association *Reports*. They naturally divide themselves into researches on sound, light, and electricity, but extend into other branches of physics as well. But his best work by far was in the invention of complicated and delicate mechanism for various purposes, in the construction of which he employed a staff of workmen trained to the highest degree of excellence. For his insight into mechanism and his power over it he was unequalled, except perhaps by Babbage. A cryptographic machine, which changed the cipher automatically and printed a message, entirely unintelligible until translated by a duplicate instrument, was one of the most perfect examples of this. Cryptography had a great fascination for Wheatstone; he studied it deeply at one time, and deciphered many of the MSS. in the British Museum which had defied all other interpreters. In acoustics his principal work was a research on the transmission of sound through solids (see TELEPHONE), the explanation of Chladni's figures of vibrating solids, various investigations of the principles of acoustics and the mechanism of hearing, and the invention of new musical instruments, *e.g.*, the concertina. The kaleidophone, intended to present visibly the movements of a sonorous body, consisted of a vibrating wire which could be varied in length, carrying a silvered bead reflecting a point of light. The motion of the bead was thus shown by persistence of the successive images on the retina, and mazy lines of light traced out its successive positions. A photometer was constructed on the same principle. In light there are a series of papers on the eye, on the physiology of vision, on binocular vision, including the invention of one of the most popular of scientific toys, the STEREOSCOPE (*q.v.*), and on color. The polar clock, devised for use in place of a sun-dial, applies the fact that the plane of polarization of sky light is always 90° from the position of the sun; hence by measuring the azimuthal angle of the plane, even when the sun is below the horizon, correct apparent solar time may be obtained. In 1835, in a paper on "The Prismatic Decomposition of Electrical Light," he proved that sparks from different metals give distinctive spectra, which could be used as a means of detecting them. This is the fundamental experiment of chemical analysis by spark spectra. But it is by his electrical work that Wheatstone will best be remembered. Much of this, such as the famous "bridge" for measuring resistances that bears his name, will be found described under ELECTRICITY (vol. viii. p. 41). He not only guided the growth of scientific telegraphy on land wires, but made the earliest experiments with submarine cables, foreseeing the practicability of this means of communication as early as 1840. For short descriptions of the "A, B, C" telegraph instrument—so popular before the introduction of the telephone—and of the automatic transmitter, by which messages may be sent at the rate of 500 words a minute, see TELEGRAPH. He also devised printing telegraph receivers of various forms, electrical chronoscopes, and many forms of electrical recording apparatus—amongst others two sets of registering meteorological instruments, of which the earlier, described in 1842, was afterwards developed by Secchi and Van Rysselberghe (see THERMOMETER, vol. xxiii. p. 310-11), but the later, put forward in 1867, included metallic thermometers and was less successful.

---

[1] [In New York he edited the *National Advocate*, an administration organ, in which his able discussion of neutral duties had great force during the war with Great Britain, from 1812 to 1815. He was a member of the State Constitutional Convention, 1821; of the Assembly, 1823; and in 1825 a Commissioner with B. F. Butler and John Dyer to revise the State statutes. He published a *History of the Northmen* (1841), which was recognized as an authority in England and was translated into French by P. Guillot (1844). His diplomatic ability was shown in negotiations as to the Scheldt dues, tolls on the Elbe, the standing of Germans naturalized in America, and finally in a treaty in 1844, which the Senate refused to ratify.

Wheaton's *Elements of International Law* was several times reprinted in America and Europe, and was translated into Chinese and Japanese.

His son ROBERT WHEATON (1826–1851), after twenty years spent abroad, studied at the Cambridge Law School, and was admitted to the bar just before his death.—AM. ED.]

[2] [The chronological place of the Cooke and Wheatstone needle recorder, subsequent to Morse's invention in 1835, is given in vol. xxiii. p. 120. See also vol. xviii. p. 883. The Morse system is now in general use.—AM. ED.]

Wheatstone's *Scientific Papers* were collected and published by the Physical Society of London in 1879. The best biographical notices of him will be found in *Min. Proc. Inst. C.E.*, vol. xlvii. p. 283, and *Proc. Roy. Soc.*, vol. xxiv. p. xvi. For Wheatstone's connection with the growth of telegraphy, see *Nature*, xi. p. 510, and xii. p. 30 *sq.*

WHEELING, a city of Ohio county, West Virginia, U.S., the largest and most important in the State, stands on the eastern bank of the Ohio and on an island in the river, in what is popularly known as the "Pan-Handle." The main portion of the city lies in the bottom land, 40 to 50 feet above low water in the river, and, on an average, about 650 feet above the sea. Immediately east of it the bluffs rise to a height of 400 feet above the river. The island portion is connected with the mainland by a fine suspension bridge, 1010 feet long. The surrounding country is quite open and well cultivated, being timbered only on the hillsides; cereals and tobacco are the principal crops, and wool is largely grown. Wheeling has railway connections eastward by the Baltimore and Ohio line to Baltimore and Washington; westward by the same line and by the Pittsburgh, Cincinnati and St. Louis; northward by the Cleveland and Pittsburgh; and southward by the Ohio River Railroad. The Ohio, which is navigable to Pittsburgh, furnishes another means of communication. The depth of water in front of the city ranges from 20 inches at the lowest stage to 30 or 40 feet during floods, while the width of the river varies from 100 to 1000 feet. The principal manufacturing industries are those of iron and steel, which employ some 2600 persons or about one-twelfth of the population. Wheeling is popularly known as the "nail city" from the large quantity of cut nails made in its workshops. It has also manufactories of glass and queensware, wine (from home-grown grapes), cigars and tobacco, lanterns, and leather, as well as breweries. The city has a large market for ginseng, which is exported almost exclusively to China. The population of Wheeling in 1880 amounted to 30,737, of whom one-fifth were foreign-born.

The first settlement (Fort Fincastle) on the present site of Wheeling was made in 1769. In 1776 its name was changed to Fort Henry; it was twice besieged by the British and Indians, in 1777 and 1782. It was incorporated as a village under its present name in 1806, and in 1836 it received a city charter. Upon the formation of the State of West Virginia in 1863 Wheeling was made the capital. In 1870 this dignity was conferred upon Charleston; in 1875 it was restored to Wheeling, but lost again in 1885 to Charleston. The following figures illustrate the growth of Wheeling: population in 1810, 914; in 1820, 1567; in 1840, 7385; in 1860, 14,083; in 1870, 19,280; and in 1880, 30,737.

WHEWELL, WILLIAM (1794–1866), philosopher and historian of science, was born on 24th May, 1794, at Lancaster, where his father was a house-carpenter. He was educated at the blue school and the grammar school of Lancaster, and afterwards at Heversham grammar school, where he obtained the exhibition which enabled him to enter Trinity College, Cambridge, in October, 1812. For the remainder of his life his home was within the walls of Trinity. He graduated as second wrangler in 1816, was elected fellow in 1817, appointed a mathematical lecturer in the following year, and in due course became one of the college tutors. From 1828 to 1832 he held the professorship of mineralogy and from 1838 to 1855 that of moral philosophy, or (as it was then called) moral theology and casuistical divinity. In 1841 he was appointed master of the college on the resignation of Dr. Wordsworth. He died on 6th March, 1866, from the effects of a fall from his horse.

Soon after taking his degree Whewell began to lay the foundation of his reputation by great and varied activity as an author, as well as by the prominent part he took in all matters educational and constitutional concerning the college and university. His first work, *An Elementary Treatise on Mechanics* (1819), was influential—along with the works of Peacock and Herschel—in reforming the traditional method of mathematical teaching in Cambridge; and it was also largely due to him that, at a later period (1856), the circle of Cambridge studies was widened by the admission of the moral and natural sciences to an academic position. On the other hand, his attitude with respect to questions of university and college reform was (especially in later life) conservative. Claiming to be a reformer, he had yet no sympathy with the constitutional changes proposed at the time, and since commonly accepted as desirable and necessary. He upheld strenuously the tutorial system, while endeavoring to improve its efficiency; he opposed the admission of Dissenters to the university in a controversy with Thirlwall (1834); he defended the system of clerical fellowships, the custom which admitted a privileged class of students under the name of "fellow commoners," and the large powers which the "caput" or head of a college then possessed in university government. The appointment of the University Commission in 1850 encountered his opposition, and the proposed reform of the university in 1855 called forth from him two pamphlets of hostile *Remarks*. The reform really wanted was, he contended, to encourage scientific and professorial work, and to utilize the college funds, not to put elections in the hands of the members of senate.

In the summer of 1826, and again in 1828, Whewell was engaged along with Airy in conducting experiments in Dolcoath mine, Cornwall, in order to determine the density of the earth. Their united labors were unsuccessful, and Whewell did little more in the way of experimental science. He was the author, however, of an *Essay on Mineralogical Classification*, published in 1828, and contributed various memoirs on the tides to the *Philosophical Transactions* of the Royal Society between 1833 and 1850. But it is on his *History* and *Philosophy of the Sciences* that his claim to an enduring reputation mainly rests. The *History of the Inductive Sciences, from the Earliest to the Present Time*, appeared originally in 1837. Whewell's wide acquaintance with various branches of science—though he cannot be said to have been a specialist in any department—enabled him to write a comprehensive account of their development, which has not yet been superseded, although it may want the thoroughness, and even in many respects the accuracy, of various subsequent histories of the special sciences. In his own opinion, moreover, the *History* was to be regarded as an introduction to the *Philosophy of the Inductive Sciences* (1840). The latter treatise[1] analyzes the method exemplified in the formation of ideas, in the new inductions of science, and in the applications and systematization of these inductions, all exhibited by the *History* in the process of development.

The *Philosophy* is described by the author as "an application of the plan of Bacon's *Novum Organum* to the present condition of physical science," and as an attempt "to extract from the actual past progress of science the elements of a more effectual and substantial method of discovery" than Bacon's. The *Philosophy* is divided into two parts, treating respectively of ideas and of knowledge. The first part begins with an investigation of ideas in general, analyzing the fundamental nature of scientific truths, the grounds of our knowledge of them, and the mental processes by which they are ascertained, and then applies these general principles to the philosophy of each of the subdivisions of science adopted in the *History*. The second part discusses knowledge or the construction of science, the processes by which our conceptions are brought to bear on facts, binding them together into ideal combinations. By the "explication of conceptions" the ideas appropriate to particular classes of facts are brought forward and explained; and by the "colligation of facts" the conceptions involving those ideas are united to the facts for the construction of science. But no art of discovery, such as Bacon anticipated, follows from the analysis of the method of scientific discovery; for the elements of "invention, sagacity, genius," are needed at each forward step in scientific progress. At the same time Whewell claimed that the methods exhibited in his analysis were, not only the methods by which discoveries had actually been made, but also as definite and practical as any that had been put forward. The process of induction (or colligation of ascertained facts into general propositions) is analyzed into three steps,—(1) the selection of the (fundamental) idea, such as space, number, cause, or likeness; (2) the formation of the conception, or more special modification of those ideas, as a circle, a uniform force, etc.; and (3) the determination of magnitudes. Upon these follow special methods of induction applicable to quantity, viz., the method of curves, the method of means, the method of least squares, and the method of residues, and special methods depending on resemblance (to which the transition is made through the law of continuity), viz., the method of gradation and the method of natural classification.

---

[1] Afterwards broken up into three parts published separately: (1) the *History of Scientific Ideas* (1858), substantially a reproduction of the first part of the *Philosophy*; (2) the *Novum Organum Renovatum* (1858), containing the second part of the same work, but without the historical review of opinions, which was issued with large additions as (3) the *Philosophy of Discovery* (1860).

Whewell's philosophy of science, as well as his ethical doctrine, was conditioned by opposition to the empirical tendency then prevalent amongst English thinkers. In this he was influenced by the results of the Kantian philosophy. He maintained the distinction between necessary and contingent truths,—the former involved in the innate constitution of the mind, the latter coming from experience. It is on this reference to the mind of what the current English philosophy attempted to derive from impressions of sense that the leading positions of his philosophy depend, and on it hinges the controversy between himself and J. S. Mill. He defended the *a priori* necessity of axioms attacked by the latter, and in his inductive theory attributed more importance to the function of the mental idea in the colligation of facts than Mill did, while he would have dispensed with the inductive methods of Mill by his rules for the construction of conceptions.

Between 1835 and 1861 Whewell was the author of various works on the philosophy of morals and politics, the chief of which, *Elements of Morality, including Polity*, was published in 1845. The peculiarity of this work,—written, of course, from what is known as the intuitional point of view,—is its fivefold division of the springs of action and of their objects, of the primary and universal rights of man (personal security, property, contract, family rights, and government), and of the cardinal virtues (benevolence, justice, truth, purity, and order). Among Whewell's other works—too numerous to mention—reference must be made to writings popular in their day, such as the Bridgewater Treatise on *Astronomy* (1833), and the essay, *Of the Plurality of Worlds* (1854), in which he argued against the probability of planetary life, and also to the *Platonic Dialogues for English Readers* (1859–61), to the *Lectures on the History of Moral Philosophy in England* (1852), to the essay, *Of a Liberal Education in General, with particular reference to the Leading Studies of the University of Cambridge* (1845), to the important edition and abridged translation of Grotius, *De Jure Belli et Pacis* (1853), and to the edition of the *Mathematical Works* of Isaac Barrow (1860).

Full bibliographical details are given by Isaac Todhunter, *W. Whewell: an Account of his Writings*, 2 vols. (1876). The *Life of W. Whewell* has been written by Mrs. Stair Douglas (1881).

WHIG AND TORY. Parliamentary parties came into existence in England as soon as parliament achieved or aimed at predominance in the state. In 1641, shortly after the meeting of the Long Parliament, they were divided on the question of church reform, passing, as soon as political questions were involved, into Cavaliers and Roundheads. After the expulsion of the Cavaliers in 1642 and 1643 the Houses were divided into a peace party and a war party, and these in 1643 took the shape of Presbyterians and Independents. After the restoration there was a country party and a court party, and to these the names of Whig and Tory were applied in 1679, in the heat of the struggle which preceded the meeting of the first short parliament of Charles II. The words were nicknames given by the opponents of each party. To call a man a Whig was to compare him with the Presbyterian rebels of the west of Scotland. To call a man a Tory was to compare him with the Papist outlaws of Ireland. In fact, at this time the Whigs were maintainers of parliamentary power over the crown and of toleration for Dissenters, the Tories maintainers of the hereditary indefeasible rights of the wearer of the crown and of the refusal of toleration to Dissenters. The relation between the parties was further qualified by the fact that the heir to the crown was a Roman Catholic, whose claim to succeed was defended by the Tories and assailed by the Whigs.

The persistency of the names of the two parties is mainly owing to their unmeaningness. As new questions arose, the names of the old parties were retained, though the objects of contention were no longer the same. The Revolution of 1688–89 made it impossible for the Tories to retain their old attitude of attachment to the hereditary right of the occupant of the throne, with the exception of the extreme wing of the party, which remained Jacobite. They still, however, continued, though accepting the Toleration Act, to oppose the offering of further favors to Dissenters. In Anne's reign, after the war with France had gone on for some time, they supported a peace policy, whilst the Whigs advocated a continuance of the war. On the whole, during the last years of the 17th and the first years of the 18th century the Whigs may be regarded as the party of the great landowners, and of the merchants and tradesmen, the Tories as the party of the smaller landowners and the country clergy. The Whigs established, through their hold upon the boroughs under the influence of the great landowners, a firm government, which could keep in check, and at last practically set aside, the power of the crown. The Tories, distrusting the authority of the ministerial Government, and fearing a new despotism based on parliamentary corruption, became, especially after Bolingbroke's return from exile, almost democratic in their views and in their demands for the purification of the existing system.

With the accession of George III. Toryism took a new form. The struggle about the Dissenters was now a thing of the past, and the king was accepted as a leader in carrying on the attack against the power of the great Whig families. The attack was the easier because the Whig families had split into factions. For some time the dividing line between Whigs and Tories was this: the Tories asserted that the king had a right to choose his ministers and control their policy, subject to the necessity of securing a majority of the House of Commons, whilst the Whigs thought that the choice should lie with leading members of parliament, and that the king should have no controlling power. The Whig view appears to resemble that subsequently adopted; but in the middle of the 18th century the corruption which prevailed rendered the analogy worthless, and the real conflict was between the corrupt influence of the crown and the influence of a clique of great landowners resting on their possession of electoral power through the rotten boroughs. In 1770 the king had his way and established Lord North at the treasury as his nominee. The Whigs, deprived of power, improved their position by the loss of one great instrument of corruption; but they were weakened by the establishment of two distinct currents of opinion in their own ranks. The main body under Rockingham was influenced by Burke to demand practical reforms, but set its face against any popular changes in the constitution. The Whigs who followed Chatham wished to place parliament on a more popular basis by the reform of the House of Commons. When in 1783 Chatham's son Pitt became prime minister, the Tory party took a new start. It retained the Tory principle of reliance on the crown, and joined to it Chatham's principle of reliance on the people as opposed to the great Whig families. It also supported Pitt in practical reforms.

All this was changed by the French Revolution. In opposition to the new democracy, the Tories coalesced with a section of the Whig families, the representatives of which entered the ministry in 1794. From this time till 1822 Toryism was synonymous with a desire to retain the existing state of things, however full of abuses it might be. When Canning and Peel entered the ministry in 1822, a gradual change took place, and a tendency to practical reform manifested itself. The refusal of Wellington to listen to any proposal for altering the constitution of the House of Commons threw power once more into the hands of the Whigs in 1830. Shortly afterwards the name Tory gave place to that of Conservative, though of late years there has been an attempt to revert to it by those Conservatives who wish to assert their power of originating a definite policy, and who do not like to be branded with a purely negative appellation. The name of Whig on the other hand was replaced by that of Liberal, being assigned for some time to the less progressive portion of the party, and thus, by becoming a term of reproach, threatening entirely to disappear.

WHIRLPOOL, a hollow in running water, caused or accompanied by a whirling motion which attracts and engulfs floating objects. The popular conception of a whirlpool was probably based on the ancient accounts of that of Charybdis, strengthened by exaggerated rumors of the Mälström in the Lofoten Islands, and, in Great Britain at least, largely consolidated by the legends of Corrievreckan. The various reports of travellers and descriptions of poetical "philosophers" as to the appearance of the Mälström were faithfully collated and thrown into stereoscopic relief by Edgar Allan Poe in his celebrated story. He describes how, with the rise of the tide, "the current acquired a monstrous velocity. . . . The vast bed of the waters, seamed and scarred into a thousand conflicting channels, burst suddenly into frenzied convulsions—heaving, boiling, hissing—gyrating in gigantic and innumerable vortices, and all whirling and plunging on to the eastward with a rapidity water never elsewhere assumes, except in precipitous descents. In a few minutes more there came over the scene another radical alteration. . . . The gyratory motions of the subsided vortices seemed to form the germ of another more vast. Suddenly—very suddenly—this assumed a distinct and definite existence, in a circle of over a mile in diameter. The edge of the whirl was represented by a broad belt of gleaming spray; but no particle of this slipped into the mouth of the terrific funnel, whose interior, as far as the eye could fathom it, was a smooth, shining, and jet-black wall of water, inclined to the horizon at an angle of some 45°, speeding dizzily round and round with a swaying and sweltering motion, and sending forth to the winds an appalling voice, half shriek, half roar, such as not even the mighty cataract of Niagara ever lifts up in its agony to heaven." Nothing could escape the violence of such a vortex. Whales caught in it were swallowed down, and the largest ship was engulfed as easily as the smallest boat. After an hour or two the funnel slowly filled and the fragments of the vessel which it had sucked down were thrown up, dashed to pieces against rocks at an unknown depth. Bearing such a reputation, whirlpools were naturally avoided by the mariner; and their real nature long remained unknown.

It was supposed that every whirlpool formed round a central rock; under it opened a great cavern or gulf, down which the waters rushed, and so the whirling was produced as in a basin emptying through a central hole. This notion was developed by Athanasius Kircher (1602–80). In his theory whirlpools marked the entrances to subterranean channels connecting different seas, and the phenomena of tides were produced by the alternate flow of water in opposite directions. Kircher gives a curious diagram of the Mälström or "umbilicus maris," illustrating his supposition that the water, after pouring into the vast funnel, flowed along a channel under the Scandinavian peninsula and rose in the Gulf of Bothnia. When the level of this gulf had been raised to a sufficient height, he thought that the current was reversed, and aided by a stream pouring through a subterranean tunnel from the White Sea, raised the tide on the coast of Norway. Carrying his theory a degree farther to account for the Gulf Stream and the Antarctic drift, Kircher, with great ingenuity, placed a grand vortex at the North pole, down which all the water of the ocean tumbled, and, passing through the earth's axis, emerged at the South pole, thus keeping up "a circulation like that of the blood in the human body."

The facts which gave rise to the wild theories of mediæval geographers and the extravagant descriptions of early voyagers are impressive enough in themselves to rank amongst the grandest phenomena of nature. No one who has seen the tide-streams racing through the Pentland Firth at 12 miles an hour, now swirling along with a smooth dimpled surface, like molten glass, now meeting the counter-current and leaping high into the air in columns of water and spray, or who has heard the roar of Corrievreckan as the Atlantic tide rushes between Scarba and Jura against an easterly gale, will be disposed to deny the terrible danger to small open vessels or to wonder that horror strengthened imagination to the confusion and exaggeration of fact.

The formation of whirlpools is a natural result of water flowing rapidly in an irregular channel (see HYDROMECHANICS, vol. xii. pp. 481, 489–90); it takes place in all rivers and in every tide-race of the sea, the depth, diameter, and velocity depending on accidental causes. The form of the surface of an ordinary whirlpool is given by Prof. J. Thomson[1] as that generated by the revolution of a curve whose formula is $y = c^3/x^2$, where y is the depth of any point on the curve below the general level remote from the whirl, x the distance of the point from the axis of revolution, and c a constant. Every point on the surface moves with the velocity a heavy body would attain in falling from the general level of the water surface to that point, and any point in the interior of the revolving mass has a velocity equal to that of the point on the surface immediately above itself. Prof. Thomson applied his researches on the motion of whirlpools to the construction of a particularly effective form of turbine.[2]

All the famous whirlpools are situated in channels essentially similar in configuration and in tidal phenomena: their vortices are produced at certain phases of the tide or with certain directions of the wind; and they are all dangerous to navigation, but the danger is due to the cause which produces the whirlpools—the tidal race—not to the "roaring wells" themselves. Whirlpools in a tidal stream are not stationary, but travel along with the current, filling up and again forming in irregular succession. Small boats have repeatedly been drawn into these vortices in the northern fjords and capsized; and trading steamers in passing through a tideway are violently deflected from their course. It is on record that a seventy-four gun ship has been whirled right round in the vortices of the Straits of Messina. The fishermen of the Norwegian fjords and of the northern island groups,—Lofoten, Faroe, Shetland, and Orkney,—still believe that, if they can throw a heavy or bulky object into a whirlpool, it will close up without harming their boats. Lithgow in his *Travels*, speaking of the Pentland Firth, says, "I denote this credibly, in a part of the northwest end of this gulf there is a certain place of sea where these distracted tides make their rencountering rendezvous, that whirleth ever about, cutting in the middle circle a sloping hole, with which, if either ship or boat shall happen to encroach, they must quickly either throw over something into it, as a barrel, a piece of timber, and such like, or that fatal euripus shall then suddenly become their swallowing sepulchre." This custom, it has been supposed, is sacrificial in its origin. Its continued practice, however, suggests what is probably the case, that the bulky object splashing into the whirl breaks the continuity of the surface and causes a collapse or filling-up. In windy weather, when there is a broken sea, vortices are not formed. The tidal stream passing through the irregular channels between islands gives rise to a complicated series of eddies and counter-currents, which, according to the British Admiralty's *Sailing Directions*, make navigation dangerous, except when guided by local knowledge and aided by fair wind and a favorable tide. The general effect appears to be that, as the tide rises, the strength of the stream increases; and the counter-currents set up along the shore, as well as the overfalls produced by inequalities of the bottom, thoroughly mix the water to a depth of from 50 to 100 fathoms. This has been proved by observations of temperature amongst the tidal currents off the Mull of Cantyre, where at all times of the year there is no difference between the surface and bottom temperature. At high water a state of rest ensues; and ebb tide usually reverses the order of phenomena, the main stream, counter-currents, and eddies running in the opposite direction, but with nearly equal strength, until low tide brings another pause.

[2] *Brit. Assoc. Rep.*, 1852, Report, p. 317.

Charybdis, a whirlpool famous in classical literature, is situated in the Straits of Messina. The rise of tide at Messina does not exceed one foot, but the current may attain the velocity of nearly 6 miles an hour. Where the north-going flood tide meets the south-running counter-current, and where the southerly ebb meets its induced northerly stream, great eddies or *garofola* are formed, one of which is Charybdis. These depend very much on the wind for the intensity of their phenomena.

In ancient maps of the united Aral-Caspian Sea two whirlpools are represented. Near the position laid down there are in the river Amu-Daria two whirlpools at the junction of several channels. These have been recently examined[1] and found to arise from the river flowing over two conical hollows in its bed, respectively 120 and 60 feet deep; these do not appear to have been formed by running water, but closely resemble craters of mud volcanoes.

The most violent tidal current is said to be that of Salten Fjord to the south of Bodö on the northwest coast of Norway, known by the name of the Saltenström, and dreaded on account of its turbulence and its numerous vortices. Opposite Salten Fjord, on the western side of Vest Fjord, the wild jagged range of the Lofoten Islands runs like a row of shark's teeth from south to north. Between two of the southernmost of the group, Moskenæs and Mosken, runs the Moskenström, a tidal current which after low water commences to flow towards the northeast, then gradually changes its direction to east, to south, and at high water to southwest; after half an hour's cessation the ebb begins to flow towards the southwest, at half ebb due west, and then gradually turns through north to northeast at low water. The current thus rotates round Mosken once in 12 hours. It runs with a velocity of 7 miles an hour when a strong wind blows in the same direction, and, as the sea-bed is very irregular and rises abruptly from 200 fathoms seaward of Mosken to 20 fathoms in the channel and Vest Fjord, the flow is very turbulent, with occasional whirlpools and opposing currents set up along the shore, giving it a character very similar to that of the Strait of Messina. This is the place of the Mälström.

In the Faroe Islands several dangerous tide-races exist in which are dreaded whirlpools, the two worst being the Quærne off Sand Island and one round the rock of Sumboemusk off Süder Island.

The Shetland and Orkney Islands are traversed by a system of formidable tideways called *roosts*, dangerous to fishing boats and very frequently forming whirlpools. It is sufficient to refer to the swiths or wells of Swona in Orkney, to the whirlpool of the Swelchie off Stroma, and the Merry Men of Mey, also in the Pentland Firth. The channel of Jura Sound in the Hebrides, which contains Corrievreckan whirlpool, resembles that of Mosken and Messina in being narrow and of very irregular configuration. The sea to the west is about 70 fathoms deep; a trough over 50 fathoms in depth and quarter of a mile wide runs through towards the east, deepening about the centre to 105 and 120 fathoms in consecutive holes. The channel is less than a mile in width, and the water is shallow (15 to 20 fathoms) from the shore out to the central trough, where the deepening is abrupt. To this fact, and not to the supposed existence of "a submerged rock of pyramidal form shooting up from a depth of 100 fathoms," are due, in all probability, the tidal stream, running sometimes at 9 miles an hour, and the great vortices which are occasionally formed, as well as the dangerous counter-currents and overfalls.

Folklore.—Many marvellous stories are told of the dwellers in whirlpools. Fish are supposed to be more abundant there than anywhere else. Whales have from earliest times been associated, if not confounded, with these gulfs; and all manner of sea-beings,—krakens, trows (trolls), and mermaids,—claim sanctuary beneath the turmoil. Ramus, two centuries ago, tried by dint of misapplied philological ingenuity to identify Charybdis with the Mälström, alleging that the fact of Ulysses's voyage to northern seas was plainly recorded in the names of islands and headlands. For the myth of Charybdis, see SCYLLA AND CHARYBDIS. Whirlpools have been brought forward to explain the origin of the tides; but a well-known Norse folk-tale in one of its forms gives to a particular vortex—the Swelchie—an additional and more important office, that of maintaining the salinity of the ocean. "Mälström" (millstream) probably refers to the rapid current resembling a mill-race. The Quærne in the Faroe Islands suggests the same idea from its name. A mist of poetical romance has always played over the roaring surges of Corrievreckan, and this finds expression in many poems and tales. Horrible sea-monsters made the gulf their home in the earliest times; but they gave place to the seductive mermaid who captivated a Macphail of Colonsay, and entertained him in her coral caves and fairy palaces beneath the sea for many years. Scott in his *Border Minstrelsy* gives another version of this story, in which Macphail outwits the mermaid and remains faithful to the maid of Colonsay. The name of the whirlpool is sometimes derived from *coire bhreacen*, "the speckled caldron," referring to the foam that usually variegates its surface; but the legend makes it the corry or gulf of Vrekan, a prince of Norway, who, having come there to woo a Hebridean chieftain's daughter, was swept into the whirlpool, and drawn down from sight forever. George Macdonald has embodied this legend in a highly dramatic poem.

Literature.—References to whirlpools occur incidentally in many places. See A. Kircher's *Mundus Subterraneus*, vol. i., Amsterdam, 1664; Pontoppidan's *Natural History of Norway*, 1755 (this work cites the opinions of earlier writers, Ramus, Arraboe, etc.). For a good description of Charybdis, see *Nicholson's Journal*, vol. i. (1798) p. 12; of Corrievreckan, *Athenæum*, 3d September, 1864. Full and trustworthy details of the actual state and dangers of special whirlpools will be found in the *Sailing Directions* or *Coast Pilots* of the British Admiralty for the various seas.

(H. R. M.)

WHIRLWIND. See METEOROLOGY, vol. xvi. pp. 134–6.

WHISKEY, or WHISKY, a spirit distilled for drinking, which originated, at least so far as regards the name,[2] with the Celtic inhabitants of Ireland and Scotland; and its manufacture and use still continue to be closely associated with these two countries. Distilled spirit first became popularly known as aqua vitæ, and it was originally used only as a powerful medicinal agent. It was not till about the middle of the 17th century that it came into use in Scotland as an intoxicating beverage. In August, 1655, the town council of Glasgow issued regulations for persons who should "brew, sell, and tap ail and acquavitæ," and in 1656 the town treasurer was indemnified for "acquavytie sent to ane friend." In 1660 an excise duty was first imposed on "acquavitæ" consumed in England; but not till the year 1684 was any record kept of the quantities on which duty was charged. In that year duty was paid on the considerable quantity of 527,492 gallons. The consumption thereafter rose with great rapidity, reaching one million gallons at the end of the century, and in 1743 the enormous quantity of 8,200,000 gallons was consumed. Meantime the evils of the traffic had induced the legislature to pass, in 1736, the Gin Act (see GIN) with the view of checking the demoralization attendant on the drinking habits of the people. It was principally in the form of gin that distilled spirits were consumed in England; but gin is nothing else than a rectified and specially flavored variety of whiskey. In Scotland and Ireland the attempts of the excise authorities to control the distillation of whiskey, and to derive revenue from it, led to unlimited smuggling and open evasion of the law, and it was not till well into the 19th century that efficient regulations and energetic supervision brought the traffic in these countries under public control. Indeed, illicit distillation is still extensively practiced in Ireland, where the detections average more than eight hundred yearly.

---

[1] Wood, in *Journ. Roy. Geogr. Soc.* (1875), xlv. p. 372.

[2] Celtic *uisge* (water); the term in its present use is probably an abbreviation of "usquebaugh" (*uisge-beatha*, "water of life)." *Cf.* Skeat, *Etym. Dict.*, s. v.

It is not easy at the present day to define whiskey. Originally it was made from malted barley, the fermented wort from which was distilled in the common pot-still (see DISTILLATION, vol. vii. p. 230); but with the introduction of the Coffey and other continuous stills, which yield a "silent" or flavorless spirit, it has become possible to prepare alcoholic liquor, which is sold as whiskey, from any cereal grain, malted or unmalted, and from potato starch, grape sugar, and numerous other starch and sugar yielding substances. As a rule, however, whiskey is made from grain, and by preference from barley, malted or raw. The bulk of the whiskey made in the United Kingdom can be separated into three classes. (1) Malt whiskey is the product of malted barley alone, distilled in the ordinary pot still. Its flavor is partly due to the circumstance that the malt is dried over a peat fire; and a spirit so prepared constitutes the pure Highland malt whiskey of Scotland. (2) Grain whiskey, under which heading comes the bulk of the Irish whiskey of commerce, is made in the pot-still, principally from raw barley, with only a small proportion of malted barley to favor the transformation of starch into sugar in the preparation of the wort. (3) Plain spirit is produced from barley, rice, and other cereals distilled in the Coffey patent still. Plain spirit forms the basis from which gin, British brandy, and other rectifier's drinks are prepared; and it is used for blending with other flavored pot-still spirits, to produce a certain character of potable spirit sold by wholesale dealers and known by special blend names. It is only the finer qualities of matured malt and grain whiskey that can be used as single or unblended spirit. In the United States whiskey is distilled chiefly from corn and rye, wheat and barley malt being used, though only to a limited extent. When spirit is distilled as whiskey, it retains the natural principles which impart an agreeable flavor to the beverage; for the fusel oil, which is contained in alcohol, and is acrid to the taste and stupefying in its effects, is to a great extent extracted. Whiskey is greatly improved by age; it is not mellow, nor its flavor agreeable, until it is several years old. In its original state it is almost colorless, but it derives a reddish hue from the wood of the barrels into which it is drawn, the inner surfaces of which are usually charred to facilitate the coloring.

In the financial year ending 31st March, 1886, there were in England 10 distilleries, in Scotland 127, and in Ireland 27. The quantity of spirits distilled in that year in the United Kingdom was 38,961,842 gallons; the number of gallons consumed as beverage was 26,342,851 (England 15,290,816, Scotland 6,297.365, Ireland 4,754,670); the quantity exported was 2,808,198 gallons; and the stock held in bonded stores at the end of 1885 was 64,405,817 gallons. The total excise revenue from the manufacture, sale, and consumption of British spirits was £13,140,695 [$63,863,777.70], a considerable decrease on previous years; and distilled spirits are now a steadily declining source of public income.

Distilled spirits in the United States are the principal, and an increasing, source of internal revenue. In the fiscal year ending 30th June, 1887, there were in the United States 969 grain distilleries; and the quantity of spirits distilled in that year (including whiskey, alcohol, high-wines, and cologne or neutral spirits, and excluding fruit-brandy) was 77,831,599 gallons. The stock of spirits remaining in bonded warehouse on 30th June, 1887, was 65,145,269 gallons. The total revenue from the manufacture and sale of distilled spirits for the fiscal year ending 30th June, 1887, was $65,829,322. This includes the tax upon whiskey, fruit-brandy, alcohol, high-wines, cologne spirits, and rum. The revenue from the manufacture of whiskey alone was $2,263,718,070.

WHIST, a game at cards. The etymology of the name is disputed; probably it is of imitative origin, from "whist" (hist, hush, silence), the game being so named because of the silence required to play it attentively.

Triumph or trump.

In the 16th century a card game called *triumph* or *trump* (corrupted from "triumph") was commonly played in England. A game called *trionfi* is mentioned as early as 1526, and *triumphus Hispanicus* in 1541. *La triomphe* occurs in the list of games played by Gargantua (Rabelais, first half of 16th century). In Florio's *Worlde of Wordes* (1598) *trionfo* is defined as "the play called trump or ruff." It is probable that the game referred to by the writers quoted is *la triomphe* of the early editions of the *Académie des Jeux*. It is important to note that this game, called by Cotton "French ruff," is similar to écarté. "English ruff-and-honors," also described by Cotton, is similar to whist. If we admit that ruff and trump are convertible terms, of which there is scarcely a doubt, the game of trump was the precursor of whist. A purely English origin may, therefore, be claimed for trump (not *la triomphe*). No record is known to exist of the invention of this game, nor of the mode of its growth into ruff-and-honors, and finally into whist. The earliest reference to trump in English is believed to occur in a sermon by Latimer, "On the Card," preached at Cambridge, in Advent, about the year 1529. He says, "The game that we play at shall be the triumph . . . . Now turn up your trump, . . . ; and cast your trump, your heart, on this card." The game of trump is frequently mentioned in the second half of the 16th century. In *Gammer Gurton's Needle* (1575) Dame Chat says, "We be fast set at trumpe." Eliot (*Fruits for the French*, 1593) calls trump "a verie common ale-house game." Rice (*Invective against Vices*, printed before 1600) observes that "renouncing the trompe and comming in againe" (*i.e.*, revoking intentionally) is a common sharper's trick. Decker (*Belman of London*, 1608) speaks of the deceits practiced at "tromp and such like games." Trump also occurs in *Antony and Cleopatra* (written about 1607), with other punning allusions to card-playing—

> "She, Eros, has
> Packed cards with Cæsar, and false-played my glory
> Unto an enemy's triumph."—Act iv. sc. 12.

Ruff-and-honors.

Ruff-and-honors, if not the same game as trump, was probably the same with the addition of a score for the four highest cards of the trump suit. A description of the game is first met with in *The Compleat Gamester* (1674) by Charles Cotton. He states that ruff-and-honors (*alias* slamm) and whist are games very commonly known in England. It was played by four players with partners, and it was compulsory to follow suit when able. The cards ranked as at whist, and honors were scored as now. Twelve cards were dealt to each player, four being left in the stock. The top card of the stock was turned up for trumps. The holder of the ace of trumps was allowed to *ruff*, *i.e.*, to take in the stock and to put out four cards from his hand. The game was played nine up; and at the point of eight honors could be called, as at long whist. Cotton adds that at whist there was no stock. The deuces were put out and the bottom card was turned up for trumps.

Whisk or whist.

It is believed that the earliest mention of whist is by Taylor, the Water Poet (*Motto*, 1621). He spells the word "whisk." The earliest known use of the present spelling is in *Hudibras, the Second Part* (spurious), 1663. The word is then spelt indifferently whisk or whist for about half a century. Cotton (1674) spells it both ways. Seymour (*Court Gamester*, 1734) has "whist, vulgarly called whisk." While whist was undergoing this change of name, there was associated with it the additional title of *swabbers* (probably allied to sweep, or sweepstakes). Fielding (*History of Mr. Jonathan Wild*) says that whisk-and-swabbers was "the game

Crown Coffee House party.

then [1682] in chief vogue." Grose (*Dictionary of the Vulgar Tongue*, 1785) states that swabbers are "the ace of hearts, knave of clubs, ace and duce of trumps at whist." The true function of the swabbers is not positively known; it is probable that the holders of these cards were entitled to receive a certain stake from the other players. Swabbers dropped out of general use during the 18th century. The points of the game rose from nine to ten ("nine in all," Cotton, 1725; "ten in all," Seymour, 1734, "rectified according to the present standard of play"). Simultaneously with this alteration, or closely following it, the entire pack of fifty-two cards was used, the deuces being no longer discarded. This improvement introduces the odd trick, an element of great interest in modern whist. Early in the 18th century whist was not a fashionable game. The Hon. Daines Barrington (*Archæologia*, vol. viii.) says it was the game of the servant's hall. Contemporary writers refer to it in a disparaging way, as being only fit for hunting men and country squires, and not for fine ladies or people of quality. According to Barrington, whist was first played on scientific principles by a party of gentlemen who frequented the Crown Coffee House in Bedford Row, London, about 1728. They laid down the following rules: "Lead from the strong suit; study your partner's hand; and attend to the score." Shortly after the celebrated Edmond Hoyle (*q.v.*) published his *Short Treatise* (1743). It has been surmised by some that Hoyle belonged to the Crown Coffee House party. This, however, is only a conjecture. There is abundant evidence to show that, in the middle of the 18th century, whist was regularly played at the coffee houses of London and in fashionable society. And it is notorious that, ever since the time of Hoyle, the game has continued to increase in public estimation.

Cotton.

Hoyle.

It will be of interest to mark the successive stages through which whist has passed from the time of Cotton to the present day. The only suggestions as to play in Cotton are that, "though you have but mean cards in your own hand, yet you may play them so suitable to those in your partner's hand that he may either trump them or play the best of that suit;" also that "you ought to have a special eye to what cards are play'd out, that you may know by that means either what to play if you lead or how to trump securely and advantagiously." It appears from this that the main ideas were to make trumps by ruffing, to make winning cards, and to watch the fall of the cards with these objects. In the rules laid down by the Crown Coffee House school a distinct advance is to be noticed. Their first rule, "Lead from the strong suit," shows a knowledge of the game only to be acquired by careful study, together with a long train of reasoning. The arguments in favor of the original strong-suit lead would be out of place here; they are to be found in any modern manual. Their second rule, "Study your partner's hand," though sound, is rather vague, and savors somewhat of a repetition of Cotton. Their third rule, "Attend to the score," if amended into "Play to the score," is most valuable. From the Crown Coffee House school to Hoyle is rather a wide jump; but there is no intervening record. Whether or not Hoyle derived at least a part of his inspiration from that school, certain it is that in his *Short Treatise* he endorsed and illustrated their rules. He also brought the doctrine of probabilities to bear on the game, and gave a number of cases which show a remarkable insight into the play. Two examples will suffice. He distinguishes between the lead of king from king, queen, knave, and one small card and of knave from king, queen, knave, and more than one small card. He also directs the third hand holding queen, ten, nine, and a small card to play the nine, not the small one, to his partner's lead of ace. This whist is so good, and so advanced, that even now, a hundred and fifty years later, only the very best players can be depended on to observe and profit by it.

Payne.

Matthews.

About 1770 was published Payne's *Maxims for Playing the Game of Whist*. The advance in this book is decided. Leading from five trumps, in the hope of bringing in your own or your partner's long suit, is made into a general rule. And here, for the first time, the rule with respect to returned leads is printed, viz., "In returning your partner's lead play the best you have, when you hold but three originally." This rule, of all elementary ones, is, according to Clay, "the most important for the observance of whist-players." Hoyle does not give any such rule for returned leads, whence it may be inferred that no settled practice prevailed in his day. Matthews's *Advice to the Young Whist-Player* (anon., 1804) repeats the "maxims of the old school," with "observations on those he thinks erroneous" and "with several new ones." Matthews's book was a valuable contribution to whist literature, but some of the maxims which he thinks erroneous are now generally allowed to be correct. Thus, he prefers leading a single card to opening a long weak suit, the modern practice being just the contrary. He rejects leads from suits of three cards, except when the leader has reason to think it is his partner's suit; then he should "play off the highest, though the king or queen," and he adds, "*N. B.*—This is contrary to the general practice, but undoubtedly right." Assuming his statement to be true, the general practice was evidently wrong. Matthews is sometimes credited with the discovery of the modern principle with regard to discarding. The old rule was always to discard from the weakest suit. The modern rule is to discard from the best protected suit when the opponents have the command of trumps. What Matthews does say is, "If weak in trumps, keep guard to your adversaries' suits; if strong, throw away from them." This advice, though good, does not amount to anything like a principle of play.

Short whist.

Clay.

Soon after Matthews wrote, the points of the game were cut down from ten to five. Clay's account of this change is that, about the beginning of the 19th century, Lord Peterborough having lost a large sum of money, the players proposed to make the game five up, in order to give the loser a chance of recovering his loss. The new game, short whist, was found to be so lively that it soon became general, and eventually superseded the long game. This produced in 1835 *Short Whist* by "Major A." "Major A." is only Matthews done into short whist by a literary hack, who substituted "five" for "ten," and so on throughout. The book would not call for notice here, but that Major A. was regarded as the authority on whist for a considerable time, probably because it was erroneously supposed that the author was the well-known Major Aubrey, one of the best players of his day. Similarly "Cœlebs" (*Laws and Practice of Whist*, 1851), who mainly repeats former writers, only calls for mention because he first printed in his second edition (1856) an explanation of the call for trumps. Calling for trumps was first recognized as part of the game by the players at Graham's Club about 1840. Long whist may be said to have died about the same time that Major A.'s book was published. The new game necessarily caused a change in the style of play, as recorded by James Clay in *The Laws of Short Whist, and a Treatise on the Game* (1864). That distinguished player says that, when he first remembered whist, its celebrities were for the most part those who had been educated at long whist. In his judgment the old school was very accurate and careful, but was wanting in the dash and brilliancy of the best modern players, and sinned by playing what is now called a backward game.

Whist then travelled, and about 1830 some of the best French whist-players, with Deschapelles at their head, modified and improved the old-fashioned system.

French whist.

They were but little influenced by the traditions of long whist, and were not content merely to imitate the English. The French game was the scorn and horror of the old school, who vehemently condemned its rash trump leads. Those who adopted the practice of the new school were, however, found to be winning players. By way of example, the English player of the old school never thought of playing to win the game before it was saved; the French player never thought of saving the game until he saw he could not win it. As between the two systems, Clay preferred the rash attack to the cautious defence, and recommended a middle course, leaning more to the new than to the old doctrine.

Cavendish.

Dr. Pole (*Philosophy of Whist*, 1883) remarks that the long experience of adepts had led to the introduction of many improvements in detail since the time of Hoyle, but that nothing had been done to reduce the various rules of the game to a systematic form until between 1850 and 1860, when a knot of young men proceeded to a thorough investigation of whist, and in 1862 one of the members of this "little whist school" brought out a work, under the pseudonym of "Cavendish," which "gave for the first time the rules which constitute the art of whist-playing according to the most modern form of the game." The little school was first brought prominently into notice by an article on whist in the *Quarterly Review* of January, 1871. On the appearance of this article it was fiercely debated by the press whether the "little school" did anything extraordinary, whether they elaborated anything, or compassed anything, or advanced a science, or whether they drew their inspiration from external sources, and merely gave a systematic arrangement to what was well known and procurable before. It was finally allowed that the little school did originate something, as they were the first to give, logically and completely, the reasoning on which the principles of the play are based. Whist had previously been treated as though the "art" of the game depended on the practice of a number of arbitrary conventions. But the fact is that all rules of whist-play depend upon and are referable to general principles, hence as soon as these general principles were stated, and the reasons for their adoption were argued, players began to discuss and to propose innovations on the previously established rules of play.

Discarding.

Echo of call for trumps.

A critical examination of the more important proposals made since 1862 may here be appropriately introduced. The older authorities laid down the rule, Discard from the weakest suit. It was shrewdly noticed that, when command of trumps was shown by the adversaries, the rule was more honored in the breach than in the observance, the reason being that, when the attack was adverse, the instinct of the player prompted him to guard his weak suits. Hence the rule was modified, and it became the practice to discard from the best protected suit when the command of trumps is with the opponents. There can be no doubt as to the soundness of this modern rule of play, and it has been generally accepted. It was suddenly discovered that Matthews advanced a similar doctrine. His pretensions to this distinction have already been examined. Soon after this (1872) followed the echo of the call for trumps. Calling for trumps, as all whist-players know, is effected by throwing away an unnecessarily high card. When the lower card is subsequently played, a royal invitation is given to the partner to abandon his own game and to lead trumps, there being great strength in the caller's hand. In practice it was found for various reasons (for which manuals must be consulted) to be highly advantageous for the caller's partner to be able to indicate whether he also had numerical strength in trumps (*i.e.*, a minimum of four). The rule was eventually adopted that the caller's partner with at least four trumps should, if he had an opportunity, call in response, or *echo*, by also throwing away an unnecessarily high card; of course, if he had the opportunity, and refrained from echoing, he had less than four trumps. This rule of play was not appreciated at the time; but now (1888) it has the adherence of all thoughtful players.

Lead from penultimate card.

Contemporaneously with the echo, the lead of the penultimate card from suits of five or more cards was strenuously advocated in some quarters, and as strenuously opposed in others. Up to this date it had been the general practice, when leading a low card from a strong suit, to prefer the lowest card of the suit, irrespective of the number held. But some acute players departed from this rule when they held an intermediate sequence of three cards. Thus, with king, ten, nine, eight, two (intermediate sequence of ten, nine, eight), they would lead the eight in preference to the two, as a card of protection, in case the partner should happen to be very weak in the suit, when the eight must force an honor, whereas the two might enable the opponent to win the first trick with a six or a seven. Equally acute partners soon observed that, when a strong-suit player began with, say, an eight, and afterwards played a small card, the card must have been from a suit of at least five cards. As soon as this inference was established, the acute leader argued that, if he could show number in his strong suit (an important exhibition in modern whist), he need not confine this exhibition to those suits only in which he held an intermediate sequence. He contended that the right play is to lead the lowest but one (or the penultimate) from all suits containing five or more cards, with which the less advanced player would begin by leading the lowest. Then ensued the grand battle of the penultimate. The old players regarded it with the same "horror" as they had formerly displayed with respect to the French school, and even went so far as to stigmatize it as a private understanding and as cheating. The next stock objection raised was that it was an innovation. These feeble arguments were soon disposed of. The method was accessible to every one through the medium of the press; and, as Clay (*Short Whist*, 1864) rightly observes, "It is fair to give your partner any intimation which could be given, if the cards were placed on the table, each exactly in the same manner as the others, by a machine, the players being out of sight and hearing each of the others." The more genuine strictures were that penultimate leads complicate the game, that they give no advantage to the players, and that they simulate leads from weak suits (from which the highest is led). It is very doubtful whether penultimate leads do complicate the game. But, admitting for the sake of argument that they do, it is no objection to an intellectual pastime that it exercises the brains of the players. The question whether those who practice penultimate leads reap any advantage therefrom is one which can only be determined by experience. The best test is the habit of those who play for a stake. They all hope to win; they are not likely to persist obstinately in a practice by which they find they gain nothing; and at the present moment (1888) there is scarcely a player of any ability who deliberately rejects the penultimate lead when he has a partner capable of understanding it. Hence it may be inferred that the experience of some sixteen years has resulted in a decided feeling that penultimate leads are on the whole advantageous to those who practice them. The simulation of a lead from a weak suit has no *locus standi* if it is borne in mind that original leads are contemplated, and that the original lead of all good players is from a strong suit. James Clay, the greatest player of his day, was at first opposed to penultimate leads. When he had considered the full arguments for and against them, he "put them to the test of his individual experience, acknowledged their value, and did not hesitate to give his adhesion to them."[1]

---

[1] Preface by the editors to Clay's *Short Whist*, 1881.

Antepenultimate lead.

The consideration of the proper card to lead from five-card suits naturally led to that of the correct lead from more than five cards, in the case of suits opened with a small card. General Drayson (*Art of Practical Whist*, 1879) was the first to lay down that six of a suit can be shown by leading the antepenultimate card. Thus, from queen, nine, seven, four, three, two of a suit he advised the lead of the four. General Drayson's proposal did not find favor with many players, though it distinctly follows where the penultimate from five is admitted.

Meanwhile, leads from high cards, having regard to the number held in the suit, had not escaped attention. Thus, from suits headed by ace, queen, knave it had always been the custom to lead ace, then queen, irrespective of number. The third hand, holding king and small ones, was expected to pass the queen. But, if the lead was from five cards or more, and the third hand held king and two small ones, this play often resulted in blocking the leader's strong suit. It was therefore held, after some discussion and tentative play, that with more than four of the suit the leader should proceed with knave after ace, in order to invite his partner to put on king, if it remained singly guarded. From this it follows that a similar distinction should be drawn as to the second lead from queen, knave, ten, according to the number of accompanying small cards. If the lead is from four cards only, queen should be led, then knave; if from more than four, queen, then ten. These innovations were introduced about 1874–75. It will be observed that the original idea in choosing a penultimate or antepenultimate card was to protect the suit, and that the original idea in choosing the higher or lower of two high indifferent cards was to give the partner the option of unblocking. Behind this there was seen to lie the collateral advantage of showing number. Hence these rules of play were frequently resorted to merely for the purpose of telling whether four or more than four cards of the suit selected to lead from were present in the hand of the original leader.

American leads.

So far the indicated method, sound enough in itself, amounted only to the enunciation of modified rules of play. It yet remained for some one to propound a constant method of treating all leads, and to classify the isolated rules so as to render it possible to lay down general principles. This was accomplished in 1883–84 by Nicholas Browse Trist, of New Orleans, U. S. A.; and hence the method of leading reduced to form by him is known by the name of *American leads*. American leads propose a systematic course of play when opening and continuing the lead from the strong suit. First, with regard to a low card led. When you open a strong suit with a low card, lead your fourth best. When opening a four-card suit with a low card, the lowest, which is the fourth best, is the card selected. When opening a five-card suit with a low card, the penultimate card is selected. Instead of calling it the penultimate, call it the fourth best. So with a six-card suit; but instead of antepenultimate, say fourth best. And so on with suits of more than six cards: disregard all the small cards and lead the fourth best. Secondly, with regard to a high card led, followed by a low card. When you open a strong suit with a high card and next lead a low card, lead your original fourth best. The former rule was to proceed with the lowest. Thus, from ace, knave, nine, eight, seven, two the leader was expected to open with the ace, and then to lead the two. An American leader would lead ace, then eight. Thirdly, with regard to a high card led, followed by a high card. When you remain with two high indifferent cards, lead the higher if you opened a suit of four, the lower if you opened a suit of five or more. Examples have already been given of the cases of ace, queen, knave, etc., and of queen, knave, ten, etc. On the promulgation of these general principles another pitched battle followed, which raged with great fury. The objections urged against American leads are much the same as those against the penultimate, viz.,—(1) that they complicate the game, (2) that they seldom affect the result, (3) that the information afforded may be of more use to the opponents than to the leader's partner. The complication argument has but little foundation in fact. All an American leader asks his partner to observe is that, when he originally leads a low card, he holds exactly three cards higher than the one led; when he originally leads a high card, and next a low one, he still holds exactly two cards higher than the second card led; and when he originally leads a high card, and follows it with a high card, he indicates in many cases, to those who know the analysis of leads (as laid down in whist books), whether the strong suit consisted originally of four or of more than four cards. It cannot be denied that moderate players may lack the quick perception which will enable them to take full advantage of the information afforded; but that is no reason why better players should be deprived of the advantage, and it is no reason why the moderate player should not learn to speak the language of whist intelligibly, for the benefit of partners who do understand it. The answer to the effect-on-the-result argument is that American leads add but little which is new to the game. They only aim at consolidating the received practice, and at extending a law of uniformity to cases not previously provided for. The who-gets-the-best-of-the-information argument is more difficult to meet. Under other whist conditions experience tells that it is advantageous in the long run to convey information of strength, notwithstanding its publication to the whole table. It is is most improbable, therefore, that a player will be at a disadvantage by publishing too much and too precise information as to his strength. But it must be admitted that this is not necessarily a *sequitur*; long experience can only decide on which side the balance of advantage lies. Five years' experience is hardly enough. But it may be remarked that no instances are known of players who, having once adopted these leads, have voluntarily relinquished them.

Play of second and third hands.

The introduction of American leads rendered it necessary thoroughly to overhaul the received play of the second and third hands,—of the second hand, in consequence of the information given, as to when he should cover or pass the card led; of the third hand, for the same reason, when he should play to unblock his partner's long suit. A discussion of these refinements would be out of place here. It is to be found in *Whist Developments*, by "Cavendish" (1885).

Laws of whist.

A printed existence was first given to the laws of whist by Hoyle in 1743. The fourteen laws then issued were subsequently increased to twenty-four. These laws were the authority until 1760, when the members of White's and Saunder's Chocolate Houses revised them. The revised laws (nearly all Hoyle) were accepted by whist players for over a century, notwithstanding that they were very incomplete. In 1863 the Turf Club undertook to frame a more comprehensive code, and to solicit the co-operation of the Portland Club. The laws of short whist, approved by these two clubs, were brought out in 1864. They were at once adopted by numerous other clubs, and are now (1888) the standard by which all disputed points are decided.

LAWS OF WHIST.[1]

Rubber.

The Rubber.—1. The rubber is the best of three games. If the first two games be won by the same players, the third game is not played.

Scoring.

Scoring.—2. A game consists of five points. Each trick, above six, counts one point.

3. Honors—*i.e.*, ace, king, queen, and knave of trumps—are thus reckoned: if a player and his partner, either separately or conjointly, hold—(i.) the four honors, they score four points; (ii.) any three honors, they score two points; (iii.) only two honors, they do not score.

---

[1] From the club code, edited by J. L. Baldwin by permission of Messrs. De La Rue and Co.

4. Those players who, at the commencement of a deal, are at the score of four, cannot score honors.

5. The penalty for a revoke takes precedence of all other scores; tricks score next; honors last.

6. Honors, unless claimed before the trump card of the following deal is turned up, cannot be scored.

7. To score honors is not sufficient: they must be called at the end of the hand; if so called they may be scored at any time during the game.

8. The winners' gain—(i.) a treble, or game of three points, when their adversaries have not scored; (ii.) a double or game of two points, when their adversaries have scored less than three; (iii.) a single, or game of one point, when their adversaries have scored three or four.

9. The winners of the rubber gain two points (commonly called the rubber points), in addition to the value of their games.

10. Should the rubber have consisted of three games, the value of the losers' game is deducted from the gross number of points gained by their opponents.

11. If an erroneous score be proved, such mistake can be corrected prior to the conclusion of the game in which it occurred, and such game is not concluded until the trump card of the following deal has been turned up.

12. If an erroneous score, affecting the amount of the rubber, be proved, such mistake can be rectified at any time during the rubber.

Cutting.

Cutting.—13. The ace is the lowest card

14. In all cases every one must cut from the same pack.

15. Should a player expose more than one card, he must cut again.

Formation of table, etc.

Formation of Table.—16. If there are more than four candidates, the players are selected by cutting, those first in the room having the preference. The four who cut the lowest cards play first, and again cut to decide on partners. The two lowest play against the two highest; the lowest is the dealer, who has choice of cards and seats, and, having once made his selection must abide by it.

17. When there are more than six candidates, those who cut the two next lowest cards belong to the table, which is complete with six players. On the retirement of one of these six players, the candidate who cut the next lowest card has a prior right to any after-comer to enter the table.

Cutting Cards of Equal Value.—18. Two players cutting cards of equal value, unless such cards are the two highest, cut again; should they be the two lowest, a fresh cut is necessary to decide which of those two deals.

19. Three players cutting cards of equal value cut again. Should the fourth (or remaining) card be the highest, the two lowest of the new cut are partners, the lower of those two the dealer. Should the fourth card be the lowest, the two highest are partners, the original lowest the dealer.

Cutting Out.—20. At the end of a rubber, should admission be claimed by any one or by two candidates, he who has, or they who have, played a greater number of consecutive rubbers than the others is, or are, out. But when all have played the same number, they must cut to decide upon the out-goers; the highest are out.

Entry and Re-entry.—21. A candidate wishing to enter a table must declare such intention prior to any of the players having cut a card, either for the purpose of commencing a fresh rubber or of cutting out.

22. In the formation of fresh tables those candidates who have neither belonged to, nor played at, any other table have the prior right of entry; the others decide their right of admission by cutting.

23. Any one quitting a table prior to the conclusion of a rubber may, with consent of the other three players, appoint a substitute in his absence during that rubber.

24. A player cutting into one table whilst belonging to another loses his right of re-entry into that latter, and takes his chance of cutting in as if he were a fresh candidate.

25. If any one break up a table, the remaining players have the prior right to him of entry into any other; and, should there not be sufficient vacancies at such other table to admit all those candidates, they settle their precedence by cutting.

Shuffling.

Shuffling.—26. The pack must neither be shuffled below the table nor so that the face of any card be seen.

27. The pack must not be shuffled during the play of the hand.

28. A pack, having been played with, must neither be shuffled by dealing it into packets nor across the table.

29. Each player has a right to shuffle, once only, except as provided by rule 32, prior to a deal after a false cut, or when a new deal has occurred.

30. The dealer's partner must collect the cards for the ensuing deal, and has the first right to shuffle that pack.

31. Each player after shuffling must place the cards, properly collected and face downwards, to the left of the player about to deal.

32. The dealer has always the right to shuffle last; but, should a card or cards be seen during his shuffling or whilst giving the pack to be cut, he may be compelled to re-shuffle.

Deal.

The Deal.—33. Each player deals in his turn. The right of dealing goes to the left.

34. The player on the dealer's right cuts the pack, and in dividing it must not leave fewer than four cards in either packet. If in cutting or in replacing one of the two packets on the other a card be exposed, or if there be any confusion of the cards or doubt as to the exact place in which the pack was divided, there must be a fresh cut.

35. When a player, whose duty it is to cut, has once separated the pack, he cannot alter his intention; he can neither re-shuffle nor re-cut the cards.

36. When the pack is cut, should the dealer shuffle the cards, he loses his deal

A New Deal.—37. There must be a new deal—(i.) if during a deal or during the play of a hand the pack be proved incorrect or imperfect; (ii.) if any card, excepting the last, be faced in the pack.

38. If whilst dealing a card be exposed by the dealer or his partner, should neither of the adversaries have touched the cards, the latter can claim a new deal. A card exposed by either adversary gives that claim to the dealer, provided that his partner has not touched a card. If a new deal does not take place, the exposed card cannot be called.

39. If during dealing a player touch any of his cards, the adversaries may do the same, without losing their privilege of claiming a new deal, should chance give them such option.

40. If in dealing one of the last cards be exposed, and the dealer turn up the trump before there is reasonable time for his adversaries to decide as to a fresh deal, they do not thereby lose their privilege.

41. If a player whilst dealing look at the trump card, his adversaries have a right to see it, and may exact a new deal.

42. If a player take into the hand dealt to him a card belonging to the other pack, the adversaries, on discovery of the error, may decide whether they will have a fresh deal or not.

A Misdeal.—43. A misdeal loses the deal.

Misdeal.

44. It is a misdeal—(i.) unless the cards are dealt in four packets, one at a time in regular rotation, beginning with the player to the dealer's left; (ii.) should the dealer place the last (*i.e.*, the trump) card face downwards on his own or any other pack; (iii.) should the trump card not come in its regular order to the dealer; but he does not lose his deal if the pack be proved imperfect; (iv.) should a player have fourteen cards and either of the other three less than thirteen: (v.) should the dealer under an impression that he has made a mistake, count either the cards on the table or the remainder of the pack; (vi.) should the dealer deal two cards at once or two cards to the same hand, and then deal a third: but if, prior to dealing that third card, the dealer can, by altering the position of one card only, rectify such error, he may do so, except as provided by the second paragraph of this law; (vii.) should the dealer omit to have the pack cut to him, and the adversaries discover the error prior to the trump card being turned up, and before looking at their cards, but not after having done so.

45. A misdeal does not lose the deal if during the dealing either of the adversaries touch the cards prior to the dealer's partner having done so; but, should the latter have first interfered with the cards, notwithstanding [that] either or both of the adversaries have subsequently done the same, the deal is lost.

46. Should three players have their right number of cards, the fourth have less than thirteen, and not discover such deficiency until he has played any of his cards, the deal stands good. Should he have played, he is as answerable for any revoke he may have made as if the missing card or cards had been in his hand; he may search the other pack for it or them.

47. If a pack during or after a rubber be proved incorrect or imperfect, such proof does not alter any past score, game, or rubber. That hand in which the imperfection was detected is null and void. The dealer deals again.

48. Any one dealing out of turn, or with the adversary's cards, may be stopped before the trump card is turned up, after which the game must proceed as if no mistake had been made.

49. A player can neither shuffle, cut, nor deal for his partner, without the permission of his opponents.

50. If the adversaries interrupt a dealer whilst dealing, either by questioning the score or asserting that it is not his deal, and fail to establish such claim, should a misdeal occur, he may deal again.

51. Should a player take his partner's deal and misdeal, the latter is liable to the usual penalty, and the adversary next in rotation to the player who ought to have dealt then deals.

Trump card.

The Trump Card.—52. The dealer when it is his turn to play to the first trick, should take the trump card into his hand. If left on the table after the first trick be turned and quitted, it is liable to be called. His partner may at any time remind him of the liability.

53. After the dealer has taken the trump card into his hand it cannot be asked for. A player naming it at any time during the play of that hand is liable to have his highest or lowest trump called.

54. If the dealer take the trump card into his hand before it is his turn to play, he may be desired to lay it on the table. Should he show a wrong card, this card may be called, as also a second, a third, etc., until the trump card be produced.

55. If the dealer declare himself unable to recollect the trump card, his highest or lowest trump may be called at any time during that hand, and, unless it cause him to revoke, must be played. The call may be repeated but not changed, *i.e.*, from highest to lowest, or *vice versa*, until such card is played.

Cards liable to be called.

Cards Liable to be Called.—56. All exposed cards are liable to be called, and must be left on the table; but a card is not an exposed card when dropped on the floor, or elsewhere below the table. The following are exposed cards: (i.) two or more cards played at once; (ii.) any card dropped with its face upwards, or in any way exposed on or above the table, even though snatched up so quickly that no one can name it.

57. If any one play to an imperfect trick the best card on the table, or lead one which is a winning card as against his adversaries, and then lead again, or play several such winning cards one after the other, without waiting for his partner to play, the latter may be called on to win, if he can, the first or any other of those tricks, and the other cards thus improperly played are exposed cards.

58. If a player or players, under the impression that the game is lost or won, or for other reasons, throw his or their cards on the table face upwards, such cards are exposed, and liable to be called, each player's by the adversary; but should one player alone retain his hand, he cannot be forced to abandon it.

59. If all four players throw their cards on the table face upwards, the hands are abandoned, and no one can again take up his cards. Should this general exhibition show that the

game might have been saved, or won, neither claim can be entertained, unless a revoke be established. The revoking players are then liable to the following penalties: they cannot under any circumstances win the game by the result of that hand, and the adversaries may add three to their score, or deduct three from that of the revoking players.

60. A card detached from the rest of the hand so as to be named is liable to be called; but, should the adversary name a wrong card, he is liable to have a suit called when he or his partner have the lead.

61. If a player, who has rendered himself liable to have the highest or lowest of a suit called, fail to play as desired, or if, when called on to lead one suit, [he] lead another, having in his hand one or more cards of that suit demanded, he incurs the penalty of a revoke.

62. If any player lead out of turn, his adversaries may either call the card erroneously led; or may call a suit from him or his partner when it is next the turn of either of them to lead.

63. If any player lead out of turn, and the other three have followed him, the trick is complete, and the error cannot be rectified. But, if only the second or the second and third have played to the false lead, their cards, on discovery of the mistake, are taken back; there is no penalty against any one, excepting the original offender, whose card may be called, or he or his partner, when either of them has next the lead, may be compelled to play any suit demanded by the adversaries.

64. In no case can a player be compelled to play a card which would oblige him to revoke.

65. The call of a card may be repeated until such card has been played.

66. If a player called on to lead a suit have none of it, the penalty is paid.

Cards played in error.

Cards Played in Error, or not Played to a Trick.—67. If the third hand play before the second, the fourth hand may play before his partner.

68. Should the third hand not have played, and the fourth play before his partner, the latter may be called on to win or not to win the trick.

69. If any one omit playing to a former trick, and such error be not discovered until he has played to the next, the adversaries may claim a new deal. Should they decide that the deal stand good, the surplus card at the end of the hand is considered to have been played to the imperfect trick, but does not constitute a revoke therein.

70. If any one play two cards to the same trick, or mix his trump, or other card, with a trick to which it does not properly belong and the mistake be not discovered until the hand is played out, he is answerable for all consequent revokes he may have made. If during the play of the hand the error be detected, the tricks may be counted face downwards, in order to ascertain whether there be among them a card too many. Should this be the case, they may be searched, and the card restored; the player is, however, liable for all revokes which he may have meanwhile made.

Revoke.

The Revoke.—71. [This] is when a player, holding one or more cards of the suit led, plays a card of a different suit.

72. The penalty for a revoke—(i.) is at the option of the adversaries, who at the end of the hand may either take three tricks from the revoking player, or deduct three points from his score, or add three to their own score; (ii.) can be claimed for as many revokes as occur during the hand; (iii.) is applicable only to the score of the game in which it occurs; (iv.) cannot be divided, *i.e.*, a player cannot add one or two to his own score and deduct one or two from the revoking player; (v.) takes precedence of every other score, *e.g.*,—the claimants two, their opponents nothing—the former add three to their score and thereby win a treble game, even should the latter have made thirteen tricks and held four honors.

73. A revoke is established, if the trick in which it occur be turned, and quitted *i.e.*, the hand removed from that trick after it has been turned face downwards on the table, or if either the revoking player or his partner, whether in his right turn, or otherwise, lead or play to the following trick.

74. A player may ask his partner whether he has not a card of the suit which he has renounced. Should the question be asked before the trick is turned and quitted, subsequent turning and quitting does not establish the revoke, and the error may be corrected, unless the question be answered in the negative, or unless the revoking player or his partner have led or played to the following trick.

75. At the end of the hand, the claimants of a revoke may search all the tricks.

76. If a player discover his mistake in time to save a revoke, the adversaries, whenever they think fit, may call the card thus played in error, or may require him to play his highest or lowest card to that trick in which he has renounced. Any player or players who have played after him may withdraw their cards and substitute others. The cards withdrawn are not liable to be called.

77. If a revoke be claimed, and the accused player or his partner mix the cards before they have been sufficiently examined by the adversaries, the revoke is established. The mixing of the cards only renders the proofs of a revoke difficult, but does not prevent the claim, and possible establishment, of the penalty.

78. A revoke cannot be claimed after the cards have been cut for the following deal.

79. The revoking player and his partner may under all circumstances, require the hand in which the revoke has been detected to be played out.

80. If a revoke occur, be claimed, and proved, bets on the odd trick or on amount of score must be decided by the actual state of the latter after the penalty is paid.

81. Should the players on both sides subject themselves to the penalty of one or more revokes, neither can win the game; each is punished at the discretion of his adversary.

82. In whatever way the penalty be enforced, under no circumstances can a player win the game by the result of the hand during which he has revoked; he cannot score more than four. (*Vide* rule 61.)

Calling for New Cards.—83. Any player (on paying for them) before, but not after, the pack be cut for the deal may call for fresh cards. He must call for two new packs, of which the dealer takes his choice.

General rules.

General Rules.—84. Where a player and his partner have an option of exacting from their adversaries one of two penalties, they should agree who is to make the election, but must not consult with one another which of the two penalties it is advisable to exact. If they do so consult, they lose their right; and if either of them, with or without consent of his partner, demand a penalty to which he is entitled, such decision is final. This rule does not apply in exacting the penalties for a revoke; partners have then a right to consult.

85. Any one during the play of a trick, or after the four cards are played, and before, but not after, they are touched for the purpose of gathering them together, may demand that the cards be placed before their respective players.

86. If any one, prior to his partner playing, should call attention to the trick—either by saying that it is his, or by naming his card, or, without being required so to do, by drawing it towards him—the adversaries may require that opponent's partner to play the highest or lowest of the suit then led, or to win or lose the trick.

87. In all cases where a penalty has been incurred, the offender is bound to give reasonable time for the decision of his adversaries.

88. If a bystander make any remark which calls the attention of a player or players to an oversight affecting the score, he is liable to be called on, by the players only, to pay the stakes and all bets on that game or rubber.

89. A bystander by agreement among the players may decide any question.

90. A card or cards torn or marked must be either replaced by agreement, or new cards called at the expense of the table.

91. Any player may demand to see the last trick turned, and no more. Under no circumstances can more than eight cards be seen during the play of the hand, viz., the four cards on the table which have not been turned and quitted, and the last trick turned.

Etiquette of Whist.

Etiquette of whist.

The following rules belong to the established etiquette of whist. They are not called laws, as it is difficult, in some cases impossible, to apply any penalty to their infraction, and the only remedy is to cease to play with players who habitually disregard them:

Two packs of cards are invariably used at clubs; if possible this should be adhered to.

Any one having the lead, and several winning cards to play, should not draw a second card out of his hand until his partner has played to the first trick, such act being a distinct intimation that the former has played a winning card.

No intimation whatever by word or gesture should be given by a player as to the state of his hand or of the game.

A player who desires the cards to be placed, or who demands to see the last trick, should do it for his own information only, and not in order to invite the attention of his partner.

No player should object to refer to a bystander who professes himself uninterested in the game, and able to decide any disputed question of facts,—as to who played any particular card, whether honors were claimed though not scored, or *vice versa*, etc.

It is unfair to revoke purposely: having made a revoke, a player is not justified in making a second in order to conceal the first.

Until the players have made such bets as they wish bets should not be made with bystanders.

Bystanders should make no remark, neither should they by word or gesture give any intimation of the state of the game until concluded and scored, nor should they walk round the table to look at the different hands.

No one should look over the hand of a player against whom he is betting.

Dummy.

Dummy.

Dummy is played by three players. One hand, called dummy's, lies exposed on the table. The laws are the same as those of whist, with the following exceptions: (i.) dummy deals at the commencement of each rubber; (ii.) dummy is not liable to the penalty for a revoke, as his adversaries see his cards; should he revoke and the error not be discovered until the trick is turned and quitted, it stands good; (iii.) dummy being blind and deaf, his partner is not liable to any penalty for an error whence he can gain no advantage: thus, he may expose some or all of his cards, or may declare that he has the game or trick, etc., without incurring any penalty: if, however, he lead from dummy's hand when he should lead from his own, or *vice versa*, a suit may be called from the hand which ought to have led.

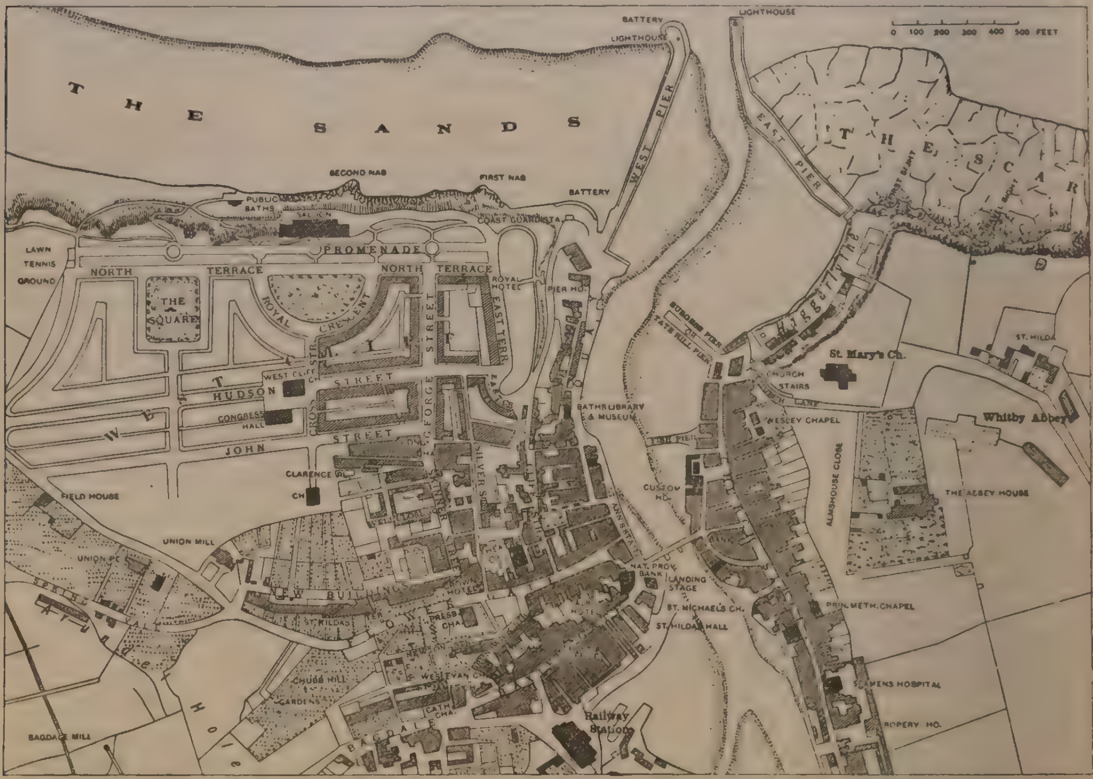
Double Dummy.—[This] is played by two players, each having a dummy or exposed hand for his partner. The laws of the game do not differ from dummy whist, except in the following special law: there is no misdeal, as the deal is a disadvantage.

(H. J.)

WHISTON, William (1667–1752), English divine and mathematician, was born on 9th December, 1667, at Norton in Leicestershire, of which village his father was rector. He was educated privately, partly on account of the delicacy of his health and partly that he might act as amanuensis to his father, who had lost his sight. He afterwards entered at Clare College, Cambridge, where he applied himself with extraordinary diligence to mathematical study, obtained a fellowship [and was ordained] in 1693. He next became chaplain to Moore, the learned bishop of Norwich, from whom he received the living of Lowestoft in 1698. He had already given several proofs of his noble but overscrupulous conscientiousness, and at the same time of the propensity to paradox and the pragmatical and wayward temper which almost destroyed the usefulness of the fine examples of disinterestedness which he gave to a lax and lukewarm age. His *Theory of the Earth* (1696), although destitute of sound scientific foundation, obtained the praise of both Newton and Locke, the latter of whom justly classed the author among those who, if not adding much to our knowledge, "at least bring some new things to our thoughts." In 1701 he resigned his living, where his conduct had been most exemplary, to become deputy at Cambridge to Sir Isaac Newton, whom he shortly afterwards succeeded as Lucasian professor of mathematics. For several years Whiston continued to write and preach both on mathematical and theological subjects with considerable success; but his study of the *Apostolical Constitutions* had convinced him that Arianism was the creed of the primitive church; and with him to form an opinion and to publish it were things almost simultaneous. His heterodoxy soon became notorious, and in 1710 he was deprived of his professorship and expelled the university. The rest of his life was spent in incessant controversy,—theological, mathematical, chronological, and miscellaneous. He vindicated his estimate of the *Apostolical Constitutions* and the Arian views he had derived from them in his *Primitive Christianity*, published in 1711. In 1713 he produced a reformed liturgy, and in 1730 one of the most valuable of his books, the *Life of Samuel Clarke*. While heretical on so many points, he was a firm believer in supernatural Christianity, and frequently took the field in defence of prophecy and miracle, including anointing the sick and touching for the king's evil. His dislike to rationalism in religion also made him one of the numerous opponents of Hoadly's *Plain Account of the Lord's Supper*. He proved to his own satisfaction that Canticles was apocryphal and that Baruch was not. He was ever pressing his views of ecclesiastical government and discipline, derived from the *Apostolical Constitutions*, on the rulers of the church, and was lost in sincere astonishment that they could not see the matter in the same light as himself. He assailed the memory of Athanasius with a virulence at least equal to that with which orthodox divines had treated Arius. He attacked Sir Isaac Newton's chronological system with success; but he himself lost not only time but money in an endeavor to discover the longitude. Of all his singular opinions the best known is his advocacy of clerical monogamy, immortalized in the *Vicar of Wakefield*. Of all his labors the most useful is his translation of Josephus, with valuable notes and dissertations, which continues to be reprinted to this day. This appeared in 1736. His last "famous discovery, or rather revival of Dr. Giles Fletcher's," which he mentions in his autobiography with infinite complacency, was the identification of the Tartars with the lost tribes of Israel. About the same time (1747) he finally left the communion of the Church of England for the Baptist, leaving the church literally as well as figuratively by quitting it as the clergyman began to read the Athanasian creed. He died in London, at the house of his son-in-law, on 22d August, 1752, leaving an autobiography, which deserves more attention than it has received, both for its characteristic individuality and as a storehouse of curious anecdotes and illustrations of the religious and moral tendencies of the age. It does not, however, contain any account of the proceedings taken against him at Cambridge, these having been published separately at the time.

Whiston is a striking example of a not unfrequent phenomenon, the association of an entirely paradoxical bent of mind with proficiency in the exact sciences. He is still more interesting as exemplifying a less ordinary observation, the possibility of arriving at rationalistic conclusions in theology without the slightest tincture of the rationalistic temper His conclusions were in many respects those of the latitudinarian divines of his day; but anything more unlike the processes by which they attained these, or the spirit in which they supported them, would be difficult to imagine. He was not only paradoxical to the verge of craziness, but intolerant to the verge of bigotry. "I had a mind," he says, "to hear Dr. Gill preach. But, being informed that he had written a folio book on the Canticles, I declined to go to hear him." This moral and intellectual unreason effectually destroyed the weight otherwise due to his erudition and acuteness, and left nothing recommendable for imitation in his conduct as a whole, except his passion for truth and his heroic disinterestedness—virtues in which few have rivalled him, though some may have exhibited them less ostentatiously. When not engaged in controversy he was not devoid of good sense. He often saw men and things very clearly, and some of his bon-mots are admirable.

WHITBY, a seaport and watering-place in the North Riding of Yorkshire, England, is picturesquely situated on both banks of the Esk, at its entrance into the North Sea, and on the Northeastern Railway, 247½ miles north of London and 56 northeast of York. The river is crossed by a bridge which opens in the centre to permit the passage of vessels. The old parts of the town present a very antique and picturesque appearance, with narrow, steep, and irregular streets and plain old-fashioned houses, while the modern portion, included chiefly in West Cliff, possesses the usual characteristics of a fashionable watering-place. Of the old abbey all that now remains are the ruins of the church, occupying the site of the old Saxon building, but exhibiting no traces of remains earlier that the 12th century. The oldest portion is the choir, which is Early English; the transept also is Early English but of later date; and the nave is rich Decorated. The west side of the nave fell in 1763 and the tower in 1830. On the south side are foundations of cloisters and domestic buildings. Adjoining the abbey is Whitby Hall, built by Sir Francis Cholmley about 1580 from the materials of the monastic buildings, enlarged and fortified by Sir Hugh Cholmley about 1635, and restored within recent years. A little below the abbey is the parish church of St. Mary, at first Norman, which still retains some portions of the original building, but owing to a variety of alterations and reconstructions at different periods presents a very incongruous appearance. The principal public buildings are the town-hall, the museum, the public baths, St. Hilda's Hall, the temperance hall, and the seaside home. Previous to 1632 the piers of the harbor were constructed of wood, but in that year a west pier of stone was constructed by Sir Hugh Cholmley. Under an Act of Parliament obtained in 1702 the west pier was reconstructed and the east pier greatly improved. Lately further improvements have been in progress, including the dredging of the river and the extension of the quay to permit the landing of fish close to the railway station. In 1886 the number of vessels that entered the port was 384 of 48,439 tons, the number that cleared 371 of 48,504 tons. The chief exports are jet ornaments and iron, but the shipping trade is on the decline; in fact the town is being gradually transformed into a fashionable watering-place. The manufacture of alum, by which in the reign of Elizabeth the foundations of its prosperity were laid, is now discontinued. The introduction of iron ship-building has also affected an industry (the building of wooden ships) for which Whitby was at one time famous; it was here that the ships for Captain Cook's voyages were built. In 1886 the number of vessels built at the port was 3 of 1356 tons. Whale-fishing, established in 1753, began to decline in 1823, and was abandoned in 1837. The only manufacture that maintains its importance is that of jet ornaments peculiar to the town, and made from time immemorial from a variety of petrified wood found towards the bottom of the Upper Lias. The fishing industry, owing to improved railway communications, has been progressive within late years. In 1886 it employed 231 boats of 1830 tons. Whitby is an important herring fishing station. The population of the urban sanitary district (area 2008 acres) was 12,460 in 1871 and 14,086 in 1881.



Plan of Whitby.

Whitby was called by the Saxons *Streonshalh*, but in Domesday the name occurs as Whitteby or the "white town." It owes its origin to the foundation of a monastery by Oswy, king of Northumbria, in 658, in fulfilment of a vow for a victory gained over King Penda. The monastery embraced an establishment both for nuns and for monks of the Benedictine order, and under Hilda, a grand-niece of Edwin, a former king of Northumbria, acquired high celebrity. In 664 it was the meeting-place of a synod held under the presidency of Oswy to determine the time of keeping Easter and the shape of the religious tonsure. In 867 the town and abbey were destroyed by the Danes, after which they lay waste for upwards of 200 years. At the Conquest they belonged to Gospatric, earl of Northumberland, whose lands where confiscated by William and given to Hugh, earl of Chester, who sold them to William de Percy. In 1074 the restoration of the abbey was begun by Reinfrid, who had been a soldier in the Conqueror's army. In 1539 the abbey and lands were surrendered to the crown, and in 1555 were purchased by Sir Richard Cholmley. Whitby obtained the grant of a market from Henry II., and of a fair from Henry VI. It was created a parliamentary borough in 1832, but in 1885 it was included in the Whitby division of the North Riding.

WHITE, Gilbert (1720–1793), the natural historian of Selborne, was born on 18th July, 1720, in the little Hampshire village which his writings have rendered so familiar to all lovers of either books or nature. He was educated at Basingstoke under Warton, father of the poet, and subsequently at Oriel College, Oxford, where he obtained a fellowship (1744). Entering upon a country curacy in 1753, he returned to Selborne in 1755, where he seems soon to have discontinued his ministrations. He obtained a sinecure living from his college in 1758; but after his father's death in the same year he became curate of the neighboring parish of Faringdon, and repeatedly declined valuable livings elsewhere, until 1784, when he returned to the curacy of Selborne, and there ministered until his death on the 26th June, 1793. He was never married.

His daily life was practically unbroken by any great changes or incidents; for nearly half a century his pastoral duties, his watchful country walks, the assiduous care of his garden, and the scrupulous posting of his calendar of observations made up the essentials of a full and delightful life, but hardly of a biography. At most we can only fill up the portrait by reference to the tinge of simple old-fashioned scholarship, which on its historic side made him an eager searcher for antiquities and among old records, and on its poetic occasionally stirred him to an excursion as far as that gentlest slope of Parnassus inhabited by the descriptive muse. Hence we are thrown back upon that correspondence with brother naturalists which has raised his life and its influence so far beyond the common-place. His strong naturalist tendencies are not, however, properly to be realized without a glance at the history of his younger brothers. The eldest, Thomas, retired from trade to devote himself to natural and physical science, and contributed many papers to the Royal Society, of which he was a fellow. The next, Benjamin, became the publisher of most of the leading works of natural history which appeared during his lifetime, including that of his brother. The third, John, became vicar of Gibraltar, where he accumulated much material for a work on the natural history of the rock and its neighborhood, and carried on a scientific correspondence, not only with his eldest brother, but with Linnæus. The youngest, Henry, who died soon after entering the church, is mentioned as having engaged in meteorological observations. The sister's son, Samuel Barker, also became in time one of White's most valued correspondents. With other naturalists, too, he had intimate relations; with Pennant and Daines Barrington he was in constant correspondence, often too with the botanist Lightfoot, and sometimes with Sir Joseph Banks and others, while Chandler and other antiquaries kept alive his historic zeal. At first he was content to furnish information from which the works of Pennant and Barrington largely profited; but gradually the ambition of separate authorship developed from a suggestion thrown out by the latter of these writers in 1770. The next year White sketched to Pennant the project of "a natural history of my native parish, an *annus historico-naturalis*, comprising a journal for a whole year, and illustrated with large notes and observations. Such a beginning might induce more able naturalists to write the history of various districts and might in time occasion the production of a work so much to be wished for, a full and complete natural history of these kingdoms." Yet the famous *Natural History of Selborne* did not appear until 1789. It was well received from the beginning.

To be a typical parish natural history so far as completeness or order is concerned, it has of course no pretensions; batches of letters, an essay on antiquities, a naturalist's calendar, and miscellaneous jottings of all kinds are but the unsystematized material of the work proper, which was never written. Yet it is largely to this very piecemeal character that its popularity has been due. The style has the simple, yet fresh and graphic, directness of all good letter writing, and there is no lack of passages of keen observation, and even shrewd interpretation. White not only notes the homes and ways, the times and seasons, of plants and animals,—comparing, for instance, the different ways in which the squirrel, the field-mouse, and the nuthatch eat their hazel-nuts,—or watches the migrations of birds, which were then only beginning to be properly recorded or understood, but he knows more than any other observer until Darwin about the habits and the usefulness of the earth-worms, and is as certain as the latest physicists that plants distil dew and do not merely condense it. The book is also interesting as having appeared on the borderland between the mediæval and the modern school of natural history, avoiding the uncritical blundering of the old Encyclopædists, without entering on the technical and analytic character of the opening age of separate monographs. Moreover, as the first book which raised natural history into the region of literature, much as the *Compleat Angler* did for that gentle art, we must affiliate to it the more finished products of later writers like Thoreau or Jefferies. Yet, while these are essential merits of the book, its endearing charm lies deeper, in the sweet and kindly personality of the author, who on his rambles gathers no spoil, but watches the birds and field-mice without disturbing them from their nest, and quietly plants an acorn where he thinks an oak is wanted, or sows beech-nuts in what is now a stately row. He overflows with anecdotes, seldom indeed gets beyond the anecdotal stage, yet from this all study of nature must begin; and he sees everywhere intelligence and beauty, love and sociality, where a later view of nature insists primarily on mere adaptation of interests or purely competitive struggles. The encyclopædic interest in nature, although in White's day culminating in the monumental synthesis of Buffon, was also disappearing before the analytic specialism inaugurated by Linnæus; yet the catholic interests of the simple naturalist of Selborne fully reappear a century later in the greater naturalist of Down.

WHITE, **Joseph Blanco** (1775–1841), author, was born at Seville on 11th July, 1775. He was educated for the Roman Catholic priesthood; but after his ordination doubts as to the principles of Catholicism led him to escape from Spain to England (1810), where he ultimately entered the Established Church, having studied theology at Oxford and made the friendship of Arnold, Newman, and Whately. He became tutor in the family of the last-named when he was made archbishop of Dublin (1831). While in this position he embraced Unitarian views; and he found an asylum amongst the Unitarians of Liverpool, where he died on 20th May, 1841.

His principal writings are *Doblado's Letters from Spain*, 1822; *Evidence against Catholicism*, 1825; *Second Travels of an Irish Gentleman in Search of a Religion*, 1834; *Observations on Heresy and Orthodoxy*, 1835. They all show literary ability, and were extensively read in their day. It is probable that his name will be longest known in the world of letters by his sonnet addressed *To Night* ("Mysterious night! when our first parent knew"), which has found its way into almost all the recent anthologies, and was spoken of by his contemporaries, Hunt and Coleridge, as one of the finest in English or indeed in any language.

See *Life of the Rev. Joseph Blanco White, written by himself, with portions of his Correspondence*, edited by John Hamilton Thom. London, 1845.

WHITE, **Robert** (1645–1704), engraver and draughtsman, was born in London in 1645. He studied engraving under David Loggan, for whom he executed many architectural subjects; his early works also include landscapes and engraved title-pages for books. He acquired great skill in portraiture, his works of this class being commonly drawn with the black-lead pencil upon vellum, and afterwards excellently engraved in line. Portraits executed in this manner he marked "ad vivum," and they are prized by collectors for their artistic merit and their authenticity. Virtue catalogued 275 portrait engravings by White, including the likenesses of many of the most celebrated personages of his day; and nine portraits engraved in mezzotint are assigned to him by J. Chaloner Smith. White died at Bloomsbury, London, in 1704.

His son, George White, who was born about 1671 and died about 1734, is also known as an engraver and portrait painter.

WHITEBAIT, the vernacular name of a small Clupeoid fish which appears in large shoals in the estuary of the Thames during the summer months, and is held in great esteem as a delicacy for the table. As to whether or not it is a distinct form, the opinions of naturalists have been divided ever since their attention was directed to the question. Pennant and Shaw believed it to be some kind of Cyprinoid fish, similar to the bleak, whilst Donovan, in his *Natural History of British Fishes* (1802–8), misled by specimens sent to him as whitebait, declared it to be the young of the shad. In 1820 Yarrell proved conclusively that Donovan's opinion was founded upon an error; unfortunately he contented himself with comparing whitebait with the shad only, and in the end adopted the opinion of the Thames fishermen, whose interest it was to represent it as a distinct adult form; thus the whitebait is introduced into Yarrell's *History of British Fishes* (1836) as *Clupea alba*. The French ichthyologist, Valenciennes, went a step further, declaring it to be not only specifically but also generically distinct from all other Clupeoids. On examining the specimens of *Clupea alba* which passed from Yarrell's collection into the British Museum, the present writer found them to be the young of the common herring (*Catal. Fish. Brit. Mus.*, vii. p. 416, 1868); and this conclusion was fully borne out by visits to the Thames boats and by an examination of their captures on the spot. The bulk of the whitebait caught consists, in May and June, chiefly of the fry of herring, mixed with a number of shrimps, gobies, sticklebacks, pipefishes, young flounders, and an occasional sprat. But, the Thames being unequal to the supply of the large demand for this delicacy, large quantities of whitebait are now brought to London and other markets from many parts of the coast. They frequently consist of a much greater proportion of young sprats than the fish obtained from the Thames; and they sometimes prove a valuable mine for the collector, who may find mixed with them pelagic animals (such as the smaller kinds of Cephalopods) which are not at all, or but rarely, met with at the mouth of the Thames or on the south coast generally. In times past whitebait were considered to be peculiar to the estuary of the Thames; and, even after the specific identification of Thames whitebait with the young of the herring from other localities, it was still thought that there was a distinctive superiority in the condition and flavor of the former. It is possible that the young herrings find in the estuary of the Thames a larger amount of suitable food than on other parts of the coast, where the water may be of greater purity, but possesses less abundance of the minute animal life on which whitebait thrive. Indeed, Thames whitebait which have been compared with young herrings from the mouth of the Exe, the Cornish coast, Menai Strait, and the Firth of Forth seemed to be better fed; but, of course, the specific characteristics of the herring,—into which we need not enter here,—were nowise modified.

The fry of fishes is used as an article of diet in almost every country: in Germany the young of various species of Cyprinoids, in Italy and Japan the young of nearly every fish capable of being readily captured in sufficient numbers, in the South Sea Islands the fry of *Teuthis*, in New Zealand young *Galaxias* are consumed at certain seasons in large quantities; and, like whitebait, these fry bear distinct names, different from those of the adult fish.

Whitebait fishing in the Thames lasts from the end of March to September. The majority of the fish caught at the beginning of spring are about two inches long; as the season advances the proportion of larger specimens becomes greater, although very small ones occur abundantly throughout the season,—thus apparently confirming the opinion of those who maintain that the herring is in its spawning not bound to any particular month. Whitebait are caught on the flood-tide from boats moored in from 3 to 5 fathoms of water. The net used is a bag some 20 feet long, narrow and small-meshed towards the tail-end, the mouth being kept open in the direction of the advancing tide by a framework 3 or 4 feet square. It is placed alongside the boat and sunk to a depth of 4 feet below the surface; from time to time the end of the bag is lifted into the boat, to empty it of its contents. The "schools" of whitebait, advancing and retiring with the tide for days and probably for weeks, have to run the gauntlet of a dozen of these nets, and therefore get very much thinned in number by the end of the season. When the view commenced to gain ground that whitebait were young herring, the question arose whether or not the immense destruction of the young brood caused by this mode of fishing injuriously affected the fishery of the mature herring. This undoubtedly it does; but, since it has been ascertained that the herring is much more restricted in its migrations than was formerly believed, and that it merely moves from the feeding-grounds in the depth of the ocean to the shallower spawning-grounds of the neighboring coast, the injury, such as it is, must be local and limited to the particular district in which the fishing for whitebait is methodically practiced.

WHITEFIELD, or Stand, a large manufacturing village of Lancashire, England, in the township of Pilkington, is situated a short distance from the Radcliffe Bridge station on the Lancashire and Yorkshire Railway, 5½ miles north of Manchester and 196 from London. It possesses a number of fine villas inhabited by Manchester merchants. The church of All Saints, commonly called Stand church, was erected in 1826 from the designs of Sir Charles Barry. There is a school founded and endowed by Henry Siddal in 1688. Whitefield has risen into importance since 1829. There are coal mines in the neighborhood, and cotton-spinning and hand and power loom weaving are carried on. The population of the urban sanitary district (area 2048 acres) was 9054 in 1871 and 9516 in 1881.

A family of the name of Pilkington was settled at Pilkington Tower or Stand soon after the Conquest, Leonard Pilkington being mentioned as lord of the manor in the tenth year of Henry I. The manor of Pilkington was granted to the earl of Derby by Henry VII. after the battle of Bosworth. The old hall of the Pilkington family, called Stand Hall, existed as recently as 1848. On the foundation stone was the date 1580.

WHITEFIELD, George (1714–1770), one of the most eloquent of pulpit orators, was born on 16th December, 1714, at the Bell Inn, Gloucester, of which his father was landlord. At about twelve years of age he was sent to the school of St. Mary de Crypt, Gloucester, where on account of his skill in elocution he was chosen to perform in a piece acted before the corporation of the school. He also became very fond of reading plays, a circumstance which probably had considerable influence on his subsequent career, for his eloquence was essentially dramatic in its character. At the age of fifteen he was taken from school to assist his mother in the public-house, and for a year and a half was a common drawer. He then again returned to school to prepare for the university, and in 1733 entered as a servitor at Pembroke College, Oxford. There he came under the influence of the Methodists (see Wesley), and entered so enthusiastically into their practices and habits that he was attacked by a severe illness, which compelled him to return to his native town. His sincere and enthusiastic piety attracted the notice of Dr. Benson, bishop of Gloucester, who ordained him deacon on 20th June, 1736. Having in the following week returned to Oxford and taken his degree, he began an evangelizing tour in Bath, Bristol, and other towns, his eloquence at once attracting immense multitudes. In 1736 he was invited by Wesley to go out as a missionary to Georgia, and went to London to wait on the trustees. Before setting sail he preached in some of the principal London churches, and so rapidly did the fame of his eloquence spread that crowds began to assemble at the church doors long before daybreak. Several of the sermons which he then preached were published "at the request of the hearers." On 28th December, 1737, he embarked for Georgia, which he reached on 7th May, 1738. After three months' residence there he returned to England to receive priest's orders, and to raise contributions for the support of an orphanage. He was, however, coldly received by the clergy generally, and began to preach in the open air. At Bristol his addresses to the colliers soon attracted crowds, which were latterly estimated to exceed 20,000 persons. Whitefield's voice was so powerful that it penetrated to the utmost limits of the crowd. His fervor and dramatic action held them spell-bound, and his homely pathos soon broke down all barriers of resistance. "The first discovery of their being affected," he says, "was by seeing the white gutters made by their tears which plentifully fell down their black cheeks." In 1738 an account of Whitefield's voyage from London to Georgia was published without his knowledge. In 1739 he published his *Journal* from his arrival in Savannah to his return to London, and also his *Journal* from his arrival in London to his departure thence on his way to Georgia. As his embarkation was further delayed for ten weeks he published *A Continuation of the Rev. Mr. Whitefield's Journal during the time he was delayed in England by the Embargo.* His unfavorable reception in England by the clergy led him to make reprisals. To Dr. Trapp's attack on the Methodists he published in 1739 *A Preservative against Unsettled Notions*, in which the clergy of the Church of England were rather bitterly denounced; he also published shortly afterwards *The Spirit and Doctrine and Lives of our Modern Clergy*, and a reply to a pastoral letter of the bishop of London in which he had been attacked. In the same year appeared *Sermons on Various Subjects* (2 vols.), the *Church Companion, or Sermons on Several Subjects*, and a recommendatory epistle to the *Life of Thomas Halyburton.* He again embarked for America in August, 1739, and remained there two years, preaching in all the principal towns. While there he published *Three Letters from Mr. Whitefield*, in which he referred to the "mystery of iniquity" in Tillotson, and asserted that that divine knew no more of Christ than Mohammed did.

During his absence from England Whitefield found that a divergence of doctrine from Calvinism had been introduced by Wesley; and notwithstanding Wesley's exhortations to brotherly kindness and forbearance he withdrew from the Wesleyan communion. Thereupon his friends built for him near Wesley's church a wooden structure, which was named the Tabernacle. In 1741, on the invitation of Ralph and Ebenezer Erskine, he paid a visit to Scotland, commencing his labors in the Secession meeting-house, Dunfermline. But, as he refused to limit his ministrations to one sect, the Seceders and he parted company, and without their countenance he made a tour through the principal towns of Scotland, the authorities of which in most instances presented him with the freedom of the burgh, in token of their estimate of the benefits to the community resulting from his preaching. From Scotland he went to Wales, where on 14th November he married Mrs. James, a widow. The marriage was not a happy one. On his return to London he preached to the crowds in Moorfields during the Whitsun holidays with such effect as to attract nearly all the people from the shows. After a second visit to Scotland, June to October, 1742, and a tour through England and

Wales, 1742–44, he embarked in August, 1744, for America, where he remained till June, 1748. On his return to London he found his congregation at the Tabernacle dispersed; and his circumstances were so depressed that he was obliged to sell his household furniture to pay his orphan-house debts. Having, however, made the acquaintance of the countess of Huntingdon, he soon found his pecuniary affairs on a better footing. The countess appointed him one of her chaplains, built and endowed Calvinistic Methodist chapels in various parts of the country, and erected a college for the training of candidates for the ministry. The remainder of Whitefield's life was spent chiefly in evangelizing tours in Great Britain, Ireland, and America. It has been stated that "in the compass of a single week, and that for years, he spoke in general forty hours, and in very many sixty, and that to thousands." On his return from America to England for the last time the change in his appearance forcibly impressed Wesley, who wrote in his *Journal:* "He seemed to be an old man, being fairly worn out in his Master's service, though he had hardly seen fifty years." When health was failing him he placed himself on what he called "short allowance," preaching only once every week day and thrice on Sunday. In 1769 he returned to America for the seventh and last time. He was now affected by a severe asthmatic complaint; but to those who advised him to take some rest, he answered, "I had rather *wear* out than *rust* out." He died on the 30th September, 1770, at Newburyport, Mass., where he had arrived on the previous evening with the intention of preaching next day. In accordance with his own desire he was buried before the pulpit in the Presbyterian church of the town where he died.

Whitefield, says Lecky, "was chiefly a creature of impulse and emotion. He had very little logical skill, no depth or range of knowledge, not much self-restraint." He possessed neither Wesley's organizing power, nor his personal authority and influence. His one talent was his gift of popular oratory, the secret of which was his command of clear and direct English, his remarkable elocutionary and dramatic skill, and his passionate fervor and simple pathos. His printed works convey a totally inadequate idea of his oratorical powers, and are all in fact below mediocrity. They appeared in a collected form in 1771–72 in seven volumes, the last containing *Memoirs of his Life,* by Dr. John Gillies. His *Letters,* 1734–70, were comprised in vols. i., ii., and iii. of his *Works* and were also published separately. His *Select Works,* with memoir by J. Smith, appeared in 1850.

See also Philip's *Whitefield's Life and Times,* 1837; Tyerman's *Life of Whitefield,* 1876–77; and Lecky's *History of England,* vol. ii. (T. F. H.)

WHITEFISH is a collective name applied in different countries to very different kinds of freshwater fishes, which, however, have this in common, that their body is covered with regularly arranged silvery scales without spots or ornamental colors. Thus the numerous European species of the Cyprinoid genus *Leuciscus* are frequently comprised under the name of "Whitefish," whilst in North America this term is in general use for the various species of the Salmonoid genus *Coregonus,* which abound in every lake and river of Canada and the northern parts of the United States.

WHITEHAVEN, a parliamentary borough of England and the principal seaport of Cumberland, is situated at the extremity of the Solway Firth, facing the Irish sea, 41 miles southwest of Carlisle and 304 northwest of London. It is connected by a branch line with the London and Northwestern Railway. The town is built chiefly in a valley overlooked by high grounds on the north and south. The streets are spacious, with handsome shops. The principal public buildings are the town hall, court-room, custom-house, police office, theatre, baths, free library, infirmary, and dispensary. The harbor is protected by two stone piers; the west pier (erected 1824–39) is 965 feet long, and the north pier (1837–41) 918 feet. There is daily communication with Liverpool, Glasgow, Belfast, Dublin, and the Isle of Man. The town has an import trade from America, the Baltic ports, France, Spain and Portugal, and the Mediterranean. The principal exports are coal, pig-iron, lime, freestone, and grain. The number of vessels that entered the port in 1886 was 2377, of 269,811 tons, the number that cleared 2297, of 257,025 tons. Iron ship-building is carried on, but the number of vessels built in 1886 was only 2 of 2406 tons. The other principal industries are engineering, brass-founding, boiler-making, brick and earthenware manufacturing, and dyeing. There are two large collieries, one extending about 1½ miles under the sea. Fishing is carried on to a small extent, the number of boats engaged in 1886 being 18 of 441 tons. The population of the urban sanitary district (area 679 acres) was 18,243 in 1871 and 19,295 in 1881.

Whitehaven owes its name to the light color of the rocks adjoining it. In the reign of Henry I. the manor formed part of the monastery of St. Mary's at York, to which the priory of St. Bees belonged. In 1599 the manor of St. Bees was purchased from Sir Thomas Chaloner by General Lowther and Thomas Wybergh, and the whole in 1644 came into the possession of Sir John Lowther, under whose auspices the town advanced with great rapidity. From Charles II. the Lowthers obtained an additional grant of 150 acres, now partly included in the town, soon after which means were taken greatly to improve the harbor. By acts passed in the 7th and 11th years of Queen Anne's reign the town is governed by twenty-two trustees elected triennially. The earl of Lonsdale, whose castle adjoins the town, is lord of the manor. Whitehaven has returned one member to parliament since 1832.

WHITELOCKE, BULSTRODE (1605–1675), son of Sir James Whitelocke, a justice of the King's Bench, was born at London, on 2d August, 1605. He was educated at Eton and afterwards at Merchant Taylors' School, London. In 1620 he entered St. John's College, Oxford. In preparing for the bar he became acquainted with Selden, who aided him in his studies and gave him the use of his library. Whitelocke sat for Stafford in the parliament of 1626, and in the course of that year was called to the bar. In 1630 he married a daughter of Alderman Bennett. During the years that followed he was in the favor of Laud. He was not a man likely to raise disturbances in church and state; and he took an active part in the preparation of the law of Court Masque after Prynne's condemnation in 1634, not long after which his wife died. Before the year was out he made a runaway match with the sister of Lord Willoughby of Parham.

When the troubles began Whitelocke's cautious nature led him to distrust Laud, though he kept himself from all communication with the Scots. In the Long Parliament he represented Great Marlow, and took part in the impeachment of Strafford. Later on he did his best to avert a civil war, but prudently remained at Westminster instead of joining the king. When the Royalists advanced after Edgehill, his house, Fawley Court, was pillaged by the soldiers. When attempts were subsequently made to open negotiations with the king, he became a leading member of the peace party, though, as he tells us himself, he "kept fair with the other leading men of the House, as Mr. Pym, Hampden, and the rest, and would not entirely engage in any party, which made him the more courted by all." He was one of the commissioners appointed to carry the terms of the parliament to Oxford in May, and drew on himself suspicions of too close intercourse with the king. Having at the close of 1644 taken part in a conference between some of the Scots and the English Presbyterians, his advice did much to frustrate a proposal for a parliamentary accusation of Cromwell. On the other hand, he spoke in the Commons against the Self-Denying Ordinance. He was again a commissioner in the negotiation with the king at Uxbridge early in 1645. Whitelocke was present at the siege of Oxford in 1646, and was on excellent terms with Fairfax and Cromwell. Later in the year he opposed an ordinance for punishing heretics. His common-sense seems to have rallied him to the tolerationists, and he took their side in opposing the divine right of presbytery and in getting rid of the Scottish army. In 1647 he tried to moderate the opposition of the Presbyterians to the army, but as usual he did not throw himself violently on either side. In 1648 he was named a commissioner of the great seal. He was much troubled at the attack on the House of Commons by Pride's "purge," but he did not resign his post. He refused to have anything to do with the king's trial; but he accepted a commissionership of the new great seal of the commonwealth after the king's execution. Both before the trial and afterwards he was on intimate terms with Cromwell. In May, 1649, his second wife died. In January, 1650, he proposed to Lady Hungerford, but, being refused by her, he was married in the following August to the widow of Alderman Wilson. Whitelocke was now a member of the council of state, striving to keep on good terms with all parties. After Cromwell's return from the Scottish war in 1651 Whitelocke was much consulted by him; but he gave offence by suggesting a restoration of the young king. After the dissolution of the Long Parliament in 1653 he was sent as ambassador to Sweden, as he thought, merely to get him out of the way. Returning in July, 1654, he was chosen member of the first parliament of the Protectorate by the county of Buckingham, and he again became a commissioner of the great seal. In May, 1655, after the dissolution of that parliament, he refused to execute an ordinance made by the Protector and council only for the reform of Chancery, and was consequently dismissed in June, but was soon afterwards appointed commissioner of the treasury. He again sat for Buckinghamshire in the second Protectorate parliament in 1657, and took an active part in forwarding the Humble Petition and Advice. In December he was appointed one of Cromwell's lords.

After Cromwell's death Whitelocke rallied to his son, and in January, 1659, was again a commissioner of the great seal. After Richard's fall he sat in the council of state, and when the Rump was turned out by the soldiers he accepted an appointment to the army's committee of safety. On 1st November he became keeper of the great seal; but on the return of the Rump he thought it prudent to go into hiding. Monk's arrival delivered him from his fears; but, when the Convention Parliament was chosen, he, characteristically "foreseeing what would come to pass, did not think fit to labor to be a parliament man." Of course he accepted the Restoration and was included in the Act of Oblivion. He died at his seat at Chilton in Wiltshire in 1675.

WHITETHROAT, a name commonly given to two species of little birds, one of which, the *Motacilla sylvia* of Linnæus and *Sylvia rufa* [1] or *S. cinerea* of some recent authors, is regarded as the type, not only of the genus *Sylvia*, but of the so-called Family *Sylviidæ* (*cf.* WARBLER).

Very widely spread over Great Britain, in some places tolerably common, and by its gesticulations and song rather conspicuous, it is one of those birds which has gained a familiar nickname, and "Peggy Whitethroat" is the anthropomorphic appellation of schoolboys and milkmaids, though it shares "Nettle-creeper" and other homely names with perhaps more than one congener, while to the writers and readers of books it is by way of distinction the Greater Whitethroat. The song of this bird, except by association with the season at which it is uttered, can scarcely be called agreeable, some of its notes being very harsh; but the performer may be seen to be always in earnest, erecting the feathers of his crown, puffing out those of his throat, shaking his wings, and making other rapid movements expressive of his feelings. Occasionally he will deliver his song as he flies up in a peculiar fashion, describing small circles in the air, stopping with a jerk, and then returning to the spot whence he arose.

The Lesser Whitethroat, *Sylvia curruca*,[2] is both in habits and plumage a much less sightly bird: the predominant reddish brown of the upper surface, and especially the rufous edging of the wing-feathers, that are so distinctive of its larger congener, are wanting, and the whole plumage above is of a smoky-gray, while the bird in its movements is never obtrusive, and it rather shuns than courts observation, generally keeping among the thickest foliage, whence its rather monotonous song, uttered especially in sultry weather, may be continually heard without a glimpse of the vocalist being presented. The nests of each of these species are very pretty works of art, firmly built of bents or other plant-stalks, and usually lined with horsehair; but the sides and bottom are often so finely woven as to be like open basket-work, and the eggs, splashed, spotted, or streaked with olive-brown, are frequently visible from beneath through the interstices of the fabric. This style of nest-building seems to be common to all the species of the genus *Sylvia*, as now restricted, and in many districts has obtained for the builders the name of "Hay-Jack," quite without reference to the kind of bird which puts the nests together, and thus is also applied to the Blackcap, *S. atricapilla*, and the Garden-Warbler—this last being merely a book-name—*S. salicaria* (*S. hortensis* of some writers).[3] The former of these deserves mention as one of the sweetest songsters of Great Britain, and fortunately it is very generally distributed in summer. To quote the praises bestowed upon it, in more than one passage, by Gilbert White would here be superfluous. The name Blackcap is applicable only to the cock bird, who further differs from his brown-capped mate by the purity of his ashy-gray upper plumage; but, notwithstanding the marked sexual difference in appearance, he takes on himself a considerable share of the duties of incubation, and has been declared by more than one writer to sing while so employed—a statement that seems hardly credible. All these four birds, as a rule, leave Great Britain at the end of summer to winter in the south.[4] Two other species, one certainly belonging to the same genus, *S. orphea*, and the other, *S. nisoria*, a somewhat aberrant form, have occurred two or three times in Great Britain. The rest, numbering perhaps a dozen, must be passed over.

Nearly allied to *Sylvia*, if indeed it can be properly separated, is *Melizophilus*, which consists of two species, one of them the curious Dartford Warbler of English writers, *M. undatus* or *provincialis*. This is on many accounts a very interesting bird, for it is one of the few of its family that winter in England,—a fact the more remarkable when it is known to be migratory in most parts of the Continent. Its distribution in England is very local, and chiefly confined to the southern counties, where through causes very insufficiently known it has of late years become so scarce that its extermination seems probable. It is a pretty little dark-colored bird, which here and there may be seen on furze-grown heaths from Kent to Cornwall. In spasmodic gesticulations the cock surpasses the Whitethroat; but these feats are almost confined to the pairing-season, and at other times of the year the bird's habits are retiring. For a species with wings so feebly formed it has a wide range, inhabiting nearly all the countries of the Mediterranean seaboard, from Palestine to the Strait of Gibraltar; and thence along the west coast of Europe to the English Channel; but everywhere else it seems to be very local.

This may be the most convenient place for noticing the small group of Warblers belonging to the well-marked genus *Hypolais*, which, though in general appearance and certain habits resembling the *Phylloscopi* (*cf.* [Willow] WREN), would seem usually to have little to do with those birds, and to be rather allied to the *Sylviinæ*, if not to the *Acrocephalinæ* (*cf.* WARBLER). They have a remarkably loud song, and in consequence are highly valued on the continent of Europe, where two species at least spend the summer. One of them, *H. icterina*, has occurred more than once in the British Islands, and their absence as regular visitors is to be regretted. Among the minor characteristics of this little group is one afforded by their eggs, which are of a deeper or paler brownish pink, spotted with purplish black. Their nests are beautiful structures, combining warmth with lightness in a way that cannot be fully appreciated by any description.

---

[1] This specific term has been very constantly but most inaccurately, not to say absurdly, used for a very different bird, the Chiffchaff (*cf.* [Willow] WREN). Its only proper application is to the Whitethroat.

[2] Of course this is not the *curruca* of ancient writers, that being almost certainly the Hedge-Sparrow (see SPARROW), the ordinary dupe of the Cuckow.

[3] This bird, if it has any true English name at all, should perhaps be called the "Pettichaps," that being applied to it, though not exclusively, in Lancashire and Yorkshire, but not, it would seem, in Northamptonshire or Hampshire (*cf.* Yarrell's *Br. Birds*, 4th ed. pp. 415, 416).

[4] The Blackcap is recorded as having occurred several times in England in winter; but its tarrying was doubtless involuntary.

A great number of other more or less allied forms, interesting as they are in various ways, cannot for want of space be here mentioned. (A. N.)

WHITFIELD, John Clarke (1770–1836), organist and composer, was born at Gloucester, 13th December, 1770, and educated at Oxford under Dr. Philip Hayes. In 1789 he was appointed organist of the parish church at Ludlow. Four years later he took the degree of Mus. Bac. at Cambridge, and in 1795 he was chosen organist of Armagh cathedral, whence he removed in the same year to Dublin, with the appointments of organist and master of the children at St. Patrick's cathedral and Christchurch. Driven from Ireland by the rebellion of 1798, he accepted the post of organist at Trinity and St. John's Colleges, Cambridge, and about the same time assumed the surname of Whitfield, in addition to that of Clarke, by which he had been previously known. He took the degree of Mus. Doc. at Cambridge in 1799, and in 1810 proceeded to the same grade at Oxford. In 1820 he was elected organist and master of the choristers at Hereford cathedral; and on the death of Dr. Haig he was appointed professor of music at Cambridge. Three years afterwards he resigned these appointments in consequence of an attack of paralysis. He died at Hereford, 22d February, 1836.

Whitfield's compositions were very numerous. Among the best of them are four volumes of anthems, published in 1805. He also composed a great number of songs, one of which—*Bird of the Wilderness*, written to some well-known verses by James Hogg, the "Ettrick Shepherd"—attained a high degree of popularity. But the great work of his life was the publication, in a popular and eminently useful form, of the oratorios of Handel, which he was the first to present to the public with a complete pianoforte accompaniment. Before his time these works could only be obtained either in full score or with a plain-figured bass, in which forms they were absolutely useless to the unlearned musician. But so great was the success of his experiment that at the present day the form he originated is the only one with which the general public is familiar. His own volumes, indeed, have been long out of print, and are not now very easy to obtain; but every one of the great oratorios, arranged on a similar plan, may be bought at a price within the reach of the poorest student of art.

WHITGIFT, John (1530 or 1533–1604), archbishop of Canterbury, was descended from a middle-class family, the elder branch of which had been long settled in Yorkshire. He was the eldest son of Henry Whitgift, merchant of Great Grimsby, Lincolnshire, where he was born, according to one account in 1533, but according to a calculation founded on a statement of his own in 1530. At an early age his education was entrusted to his uncle, Robert Whitgift, abbot of the neighboring monastery of Wellow, by whose advice he was afterwards sent to St. Anthony's school, London. There he lodged with his aunt, wife of the verger of St. Paul's cathedral; but, having through his uncle's teaching imbibed so much of the Reformation doctrine that he declined to attend mass in the cathedral, he quarrelled with his aunt and had to return home. In 1549 he matriculated at Queen's College, Cambridge, and in May, 1550, he migrated to Pembroke Hall, where he had the martyr John Bradford for a tutor. On 31st May, 1555, he became a fellow of Peterhouse. Having taken holy orders in 1560, he became in the same year chaplain to Dr. Cox, bishop of Ely, who collated him to the rectory of Teversham, Cambridgeshire. In 1563 he was appointed Lady Margaret professor of divinity at Cambridge, and his lectures gave such satisfaction to the authorities that on 5th July, 1566, they considerably augmented his stipend. The following year he was appointed regius professor of divinity, and also became master of Trinity. He had a principal share in compiling the statutes of the university, which passed the great seal on 25th September, 1570, and in November following he was chosen vice-chancellor. Macaulay's description of Whitgift, as "a narrow, mean, tyrannical priest, who gained power by servility and adulation," is tinged with rhetorical exaggeration; but undoubtedly Whitgift's extreme High Church notions led him to treat the Puritans with exceptional intolerance. In a pulpit controversy with Cartwright, regarding the constitutions and customs of the Church of England, he showed himself Cartwright's inferior in oratorical effectiveness, but the balance was redressed by the exercise of arbitrary authority. Whitgift, with other heads of the university, deprived Cartwright in 1570 of his professorship, and in September, 1571, he exercised his prerogative as master of Trinity to deprive him of his fellowship. In June of the same year Whitgift was nominated dean of Lincoln. In the following year he published *An Answere to a Certain Libel intituled an Admonition to the Parliament*. To this Cartwright replied by a *Second Admonition to the Parliament*; and in 1573 Whitgift published a third edition of his *Answere*, with additions bearing on Cartwright's *Admonition*. Cartwright thereupon rejoined by a *Replye to an Answere made of M. Doctor Whitegifte*; and in 1574 Whitgift published *Defence of the Answere to the Admonition against the Replye of T. C.* On 24th March, 1577, he was appointed bishop of Worcester, and during the absence of Sir Henry Sidney in Ireland he for two and a half years acted as vice-president of Wales. In August, 1583, he was nominated archbishop of Canterbury, and thus was largely instrumental in giving its special complexion to the church of the Reformation. Although he wrote a letter to Queen Elizabeth remonstrating against the alienation of church property, Whitgift always retained her special confidence. In his policy against the Puritans, and in his vigorous enforcement of the subscription test, he was only obeying her behests. His course of action gave rise to the Mar-prelate tracts, in which the bishops and clergy were bitterly attacked. Through Whitgift's vigilance the printers of the tracts were, however, discovered and punished; and in order more effectually to check the publication of such opinions he got a law passed in 1593 making Puritanism an offence against the statute law. In the controversy between Travers and Hooker he interposed by prohibiting the preaching of the former; and he moreover presented Hooker with the rectory of Boscombe in Wiltshire, in order to afford him more leisure to complete his *Ecclesiastical Polity*, a work which, however, cannot be said to represent either Whitgift's theological or his ecclesiastical standpoint. Towards the close of his episcopate he, in conjunction with the bishop of London and other prelates, drew up the Calvinistic instrument known as the Lambeth Articles. They were, however, not accepted by the church. Whitgift attended Elizabeth on her deathbed, and crowned James I. He was present at the Hampton Court Conference in January, 1604, and died at Lambeth on the 29th of the following February. He was buried in the church of Croydon, and his monument there with his recumbent effigy was in great part destroyed in the fire by which the church was burnt down in 1867.

Whitgift is described by his biographer, Sir G. Paule, as of "middle stature, strong and well shaped, of a grave countenance and brown complexion, black hair and eyes, his beard neither long nor thick." He was noted for his hospitality, and was somewhat ostentatious in his habits, sometimes visiting Canterbury and other towns attended by a retinue of 800 horsemen. He left several unpublished works, which are included among the MSS. *Angliæ*. Many of his letters, articles, injunctions, etc., are calendared in the published volumes of the State Paper series of the reign of Elizabeth. His *Collected Works*, edited for the Parker Society by Rev. John Ayre, 3 vols., Cambridge, 1851–53, include besides the controversial tracts already alluded to, two sermons published during his lifetime, a selection from his letters to Cecil and others, and some portions of his unpublished MSS.

A *Life* of Whitgift by Sir G. Paule appeared in 1612, 2d ed. 1699. It has been embodied by Strype in his *Life and Acts of Whitgift*, 1718. There is also a life in Wordsworth's *Ecclesiastical Biography*, Hook's *Archbishops of Canterbury*, and vol. i. of Whitgift's *Collected Works*. See also Cooper's *Athenæ Cantabrigienses*.

WHITING, a marine fish (*Gadus merlangus*), abundant on the shores of the German Ocean and all round the coast of the British Islands. It is distinguished from the other species of the genus *Gadus* or Codfish by having from thirty-three to thirty-five rays in the first anal fin, and by lacking the barbel on the chin (which is so well developed in the common cod-fish whiting-pout, etc.) entirely, or possessing only a minute rudiment of it. The snout is long, and the upper jaw longer than the lower. A black spot at the root of the pectoral fin is also very characteristic of this species, and but rarely absent. The whiting is one of the most valuable food fishes of northern Europe, and is caught throughout the year by hook and line and by the trawl. It is in better condition at the beginning of winter than after the spawning season, which falls in the months of February and March. Its usual size is from 1 to 1½ pound, but it may attain to twice that weight. In the south of Europe it is replaced by an allied species, *Gadus euxini*, which, however, seems to be limited to the cold waters of the Adriatic and Black Seas.

WHITLOW is a name applied loosely to any inflammation involving the pulp of the finger, attended by swelling and throbbing pain. In the simplest form, apt to occur in sickly children, the inflammation results in a whitish vesicle of the skin, containing watery or bloody fluid. In all such cases, where the deeper structures are not implicated, no radical local treatment is needed, although the illness is an indication for constitutional treatment. The affection is not usually spoken of as whitlow unless it involves the deeper structures of the last joint of the finger. These are in a peculiarly close relation to the surface ; hence the liability to deep-seated formations of matter, from some slight scratch or prick (poisoned or otherwise) of the skin over the pulp of the finger, or even when there is no obvious external provocation. The intimate connection of the surface with the deep structures is near the finger tip ; in that region there are certain regular bundles of strong fibres passing from the under layers of the skin, through the fat of the finger pulp, down to the free end of the bone, which is roughened and expanded in a very peculiar manner for their insertion. These fibres, which are proper to adults, serve to convey an inflammatory infection from the skin down to the bone, or to the periosteum or covering of the bone, and to the tendon (of the deep flexor muscle of the finger) inserted into that part of the last joint of the finger next to the hand. The peculiar danger of a whitlow is that, if it be not opened in time by a deep cut down to the bone along the middle line of the phalanx, the inflammation will attack the covering of the bone, and so produce mortification or necrosis of the latter, and then attack the insertion of the tendon, causing sloughing of it also. In this way a whitlow, which has been neglected or treated by temporizing and ineffective methods, often leads to a loss of the bony tip of the last finger-joint, or even of the whole of the joint, and to a proportionate shortening and deformity of the finger. In another class of cases, which are fortunately less common, the deep-seated inflammation travels along the various structures of the finger towards the palm of the hand. The inflammation extends inside the dense fibrous tunnel or sheath which contains and binds down both tendons upon the middle and proximal joints of the finger. In that confined space the inflammation becomes peculiarly virulent : the tension of the part gives the pain a bursting character ; the redness and swelling extend all round the fingers and to the back of the hand and wrist ; and the result of all this suppuration and sloughing may be rigidity and contraction of the fingers and hand. Whenever matter burrows in this way, the treatment must be by free incisions. In all cases of whitlow the general disturbance of health is excessive.

The general treatment of all whitlow inflammations consists at the outset in relief of a congested state of the system, where such exists, by a purge and by a restricted diet, in applying poultices or hot compresses to the affected finger, and in carrying the arm in a sling. The presence of matter will not be obvious by the ordinary signs of a gathering ; attempts to let out the matter by anything short of a free and deep incision are likely to fail and to cause the loss of more or less of the bone.

Whitlows have sometimes been observed to occur among a number of persons together, in a sort of epidemic, especially where the individuals are all subject to the same conditions of living, as among troops in garrison. These epidemics usually occur at a season (probably the spring) when erysipelas, carbuncles, and boils are prevalent.

WHITSTABLE, a watering-place and seaport of Kent, England, is situated on the south side of the Thames estuary and on the Southeastern and the London, Chatham, and Dover Railway lines, 6 miles north-northwest of Canterbury and 62 south-southeast of London. It consists chiefly of one main street, about a mile in length, and two narrower streets parallel with it, built on an embankment. The church of All Saints, in the Decorated and Perpendicular styles, possesses some old brasses ; it was restored in 1875. The other principal buildings are the institute for literature, science, and art (in connection with which there are a library, museum, and aquarium), the assembly rooms, the foresters' hall, and the Wynn Ellis almshouses. The "Street," a low narrow ledge of shingle running for three quarters of a mile towards the sea, forms a natural pier and promenade. Whitstable has been famous for its oyster beds from time immemorial. The oysters raised there greatly excel all others in delicacy of flavor, and to economize space spat from other beds is brought to Whitstable to mature. The lands are held by a company of dredgers incorporated by Act of Parliament in 1793, the affairs being administered by a foreman, deputy foreman, and jury of twelve men. The less extensive Seasalter and Ham oyster fishery adjoins. Of late years the productiveness of the beds has been declining, owing, it is said, to the emptying of refuse and rubbish into the Thames. There is a considerable coasting trade in coal in conjunction with the Southeastern Railway Company, who are the owners of the harbor. The population of the township and parish (3601 acres) in 1871 was 4881 and 4882 in 1881. A portion of Seasalter is included in Whitstable.

Whitstable and Seasalter embrace what was formerly known as the "borough of Harwich," but its boundaries are not now recognizable. Some Roman remains have been discovered. At Domesday the manor of Whitstable was held by Odo, bishop of Bayeux. Subsequently it came by female descent to the earls of Athole, and afterwards was several times in the hands of the crown, before it came to St. John, Viscount Bolingbroke. In modern times it was held by Wynn Ellis, who left a valuable collection of paintings to the nation.

WHITSUNDAY, or **PENTECOST** (*πεντηκοστή*), the fiftieth day after Easter Sunday, one of the principal feasts of the Christian Church, is enumerated among these along with Easter Sunday, Good Friday, and the Sundays throughout the year by Origin (*Cont. Cels.*, viii. 392), and is thus enjoined in the *Apostolical Constitutions* (v. 20) : "After ten days from the Ascension, which from the first Lord's Day is the fiftieth day, do ye keep a great festival on the day the Lord Jesus sent on us the gift of the Holy Ghost." The origin of the Anglo-Saxon name of White Sunday, which also occurs in Icelandic, is somewhat obscure, for in the Roman Church the Dominica in Albis (Low Sunday), so called from the white robes then worn by candidates for baptism, has always been the Sunday immediately following Easter. A very probable suggestion is that in northern countries the colder climate made it desirable to postpone the great baptismal festival to a time when the spring season was further advanced.

WHITTINGTON, a town of Derbyshire, England, is situated on the Chesterfield Canal and on the Midland Railway, 9½ miles southeast of Sheffield and 153 north-northwest of London. The church of St. Bartholomew, in the Early English style, was erected in 1863 near the site of an older one; it contains the old font and also a mural monument to the antiquary, Dr. Pegge (died 1796). The principal works are large iron factories. The manufacture of stone bottles and coarse earthenware is also carried on. Whittington was placed under the government of a local board in 1873. The population of the urban sanitary district (area 1581 acres) was 5578 in 1871 and 7271 in 1881.

WHITTINGTON, Sir Richard (died 1423), was the son of Sir William de Whittington of Pauntley, Gloucestershire, who died an outlaw in 1360. His mother was Joan, daughter of William Mansell, who was high-sheriff of Gloucestershire in 1308. Richard Whittington makes his first appearance in 1379, when he contributed five marks [$46.34] to a city loan. In 1392[1] he was elected alderman and sheriff of London, being at that time a member of the Mercers' Company. He was appointed or elected mayor in 1397, 1398, 1406, and 1419; and in 1416 he was chosen member of parliament for London. In April, 1402, he supplied cloth of gold for the marriage of the king's daughter Blanche with Louis, son of the emperor Rupert, and four years later (July, 1406), for that of Philippa and Erik VII. of Denmark. In March, 1413, the king repaid him a loan of £1000 [$139,030], and in September, 1415, he was granted a lien on the customs of Boston, Kingston-on-Hull, and London, in discharge of 700 marks [$65,880.67] lent to Henry V. (by whom he seems to have been knighted). He died in March, 1423. Among his chief benefactions by will were the rebuilding of St. Michael's church, in connection with which he founded a college, and of Newgate. He is said to have also restored St. Bartholomew's hospital, London.

All that is known about Whittington has been carefully collected in the Rev. Samuel Lysons's *Model Merchant of the Middle Ages* (London, 1860), from which the above account is taken. Lysons argues very strongly in favor of the famous story of "Whittington and his Cat," and rejects the rationalization which explains the legend by supposing Whittington's fortunes to have been made in the voyages of a mediæval *cat* or merchant-vessel. He is, however, only able to trace back the actual quadruped to a picture which is inscribed "R Whittington 1536." Even this picture he had never seen; and he has to admit that it bore marks of having been altered from its original size, and that the inscription is later than the alteration. The story, however, was evidently current by the end of the 16th century. Moreover, it is said that the figure of a cat was represented at the feet of the statue of Liberty on the gate of Newgate previous to the great fire of 1666; or, according to another account, Whittington's own "statue with the cat remained in a niche to its final demolition on the rebuilding of the present prison." In repairing a house which once belonged to the Whittington family at Gloucester in 1862, a stone of 15th century workmanship was discovered and on it appeared in bas-relief the figure of a boy nursing a cat in his arms. All this, however, cannot be said to go very far towards proving the veracity of the old legend. Clouston (*Popular Tales and Fictions*, London, 1887, ii. 65–78) traces the main features of the story in the folk-lore of Denmark, Russia, Norway, Brittany, and even Persia. It was current in Italy during the 15th century; but its earliest appearance seems to be in Abdullah's *History of Persia*, written towards the close of the 13th century. This writer ascribes the occurrences he tells of to the first half of the 11th century. Even this, in Clouston's opinion, is not the original form of the story, which from one or two of its details he suspects to be of Buddhist origin.[2]

WHITWORTH, a manufacturing village of Lancashire, England, is situated on the river Spodden and on the Rochdale and Bacup branch of the Lancashire and Yorkshire Railway, 3 miles north of Rochdale. It possesses the usual characteristics of the cotton manufacturing districts. Coal mining is also carried on in the neighborhood. The church of St. Bartholomew is in the Early English style. The manor of Whitworth was granted to the abbey of Stanilaw in the reign of John. A local board of twelve members was formed in 1874. The urban sanitary district, which includes the villages of Hallford, Facit, and Leavingreave, had an area of 8000 acres, with a population of 11,892, in 1881.

WHOOPING-COUGH. See Hooping-Cough.

WHORTLEBERRY, a vernacular name corrupted from the Latin *myrtillus*,[3] under which appellation, according to Prior, the berries of the common myrtle were employed in the Middle Ages for culinary purposes. In more modern times the term has been applied to various species of *Vaccinium*, particularly to *V. Myrtillus*, also known as the bilberry. The berries of this plant have a considerable similarity to those of the myrtle. Several species of *Vaccinium* occur on moorlands throughout the northern hemisphere. They are low shrubs allied to heaths, usually with evergreen leaves and with small bell-shaped or urn-shaped flowers, which have an inferior ovary surmounted by five calyx lobes. The stamens, though in a single row, are double the number of the corolla lobes. The anthers have usually two horns at the back and are generally prolonged at the top into two longish tubes, each with a hole at the extremity, through which the pollen escapes. The fruit is a globular or ovoid, many-seeded berry. *V. Myrtillus* and *V. uliginosum* have blue berries; *V. Vitis idæa*, the cowberry, has red fruits. A hybrid between *V. Myrtillus* and *V. Vitis idæa*, called *V. intermedium*, occurs in Shropshire and Staffordshire. The cranberry (*Oxycoccus*) is very closely allied to the whortleberry.

WHYDAH. See Dahomey, vol. vi. p. 675.

WICHITA, a city of the United States, the county seat of Sedgwick county, Kansas, is situated on the east bank of the Arkansas river, in the midst of an extremely fertile region. It is entered by six lines of railway, thus being one of the most important railway centres of the State. Its growth has been remarkable, even in this region of rapid development. In 1870 its site was without inhabitants; in 1880 it contained 4911 persons, while in 1886 it had a population of 20,129, making it the fourth city of the State.

WICK, a royal and parliamentary burgh and seaport of Scotland, the county town of Caithness, is situated on the German Ocean at the head of Wick Bay and at the eastern terminus of the Sutherland and Caithness section of the Highland Railway, 374 miles north of Edinburgh by rail and 18½ south of John O'Groat's House. It consists of the old burgh of Wick on the north bank of the river, Louisburgh, a northern continuation of Wick, and Pultneytown, the chief seat of commerce and trade, on the south side of the river. Pultneytown, laid out in 1805 by the British Fishery Society, is built on a regular plan; and Wick proper consists chiefly of the narrow and irregular High Street, off which is the temperance hall, with Bridge Street, somewhat more regularly built, and containing the town-hall and the county buildings. In Pultneytown there are an academy, a chamber of commerce, a naval reserve station, and a fish exchange. The port consists of two harbors of fair size; but the entrance is dangerous in stormy weather. Several expensive schemes for constructing a breakwater have resulted in disastrous failure. In 1886 the number of vessels that entered the port was 1128 of 109,142 tons, the number that cleared 1094 of 103,162 tons. The average value of the exports for the five years ending 1887 was about £150,000 [$729,000]; but in 1886 it was only £89,641 [$435,655.26]. The chief exports are fish, cattle, and agricultural produce, and the imports include coal, wood, and provisions. Steamers from Granton and Aberdeen to Thurso, the Orkneys, and the Shetlands call at Wick going and returning. It is, however, chiefly to its fisheries that the town owes its prosperity. For many years it was the chief seat of the herring-fishing on the east coast of Scotland; but its insufficient harbor accommodation has greatly hampered its progress, and both Peterhead and Fraserburgh more than rival it as fishing ports. The number of boats belonging to the port in 1885 was 807; the value of the herrings cured was £117,754 [$572,284.44] and of cod, ling, and skate, £61,928 [$300,970.08]. Ship-building, formerly prosecuted, has now been discontinued; but boat-building and net-making are extensively carried on. There are also cooperages, flour-mills, steam saw-mills, a rope and a woollen manufactory, and a distillery. Wick forms one of a group of parliamentary burghs called the Wick burghs. The population of the parliamentary burgh, which includes the royal burgh of Wick, Pultneytown, and Louisburgh, was 8145 in 1871 and 8053 in 1881. In the last year the population of the royal burgh was only 1420. In 1883 the royal burgh was extended by the inclusion of Louisburgh. The population of this extended area in 1881 was 2954.

---

[1] [Lysons says that he was elected this year, but that from 1391 to 1392 the king's writ suspended the shrievalty, after which in 1393 Whittington was elected sheriff.—Am. Ed.]

[2] [See also *Sir Richard Whittington* by Besant and Rice (1881).—Am. Ed.]

[3] [See *Skeat's Dictionary* for the derivation from a diminutive of the Anglo-Saxon *wyrtil*, a small shrub.—Am. Ed.]

Wick (Vik or "bay") is mentioned as early as 1140. It was constituted a royal burgh by James VI. in 1589, its superior being then George, earl of Caithness. By a parliamentary bounty in 1768 some impetus was given to the herring-fishery, but its real importance dates from the construction of a harbor in 1808. It has sent one member to parliament since 1832.

WICKLIFFE. See WYCLIFFE.

WICKLOW, a maritime county of Ireland, in the province of Leinster, is bounded on the E. by St. George's Channel, N. by the county of Dublin, S. by Wexford, and W. by Carlow and detached portions of Kildare. The area is 500,178 acres or about 781 square miles.

Physical Features.—The coast is precipitous and picturesque, but very dangerous of approach owing to sandbanks. There are no inlets that can be properly termed bays. The harbor at Wicklow has lately been improved; but that of Arklow is suitable only for small vessels. To the north of the town of Wicklow there is a remarkable shingle beach, partly piled up by the waves and currents. The central portion of the county is occupied by a granite mountain range, forming one of the four principal mountain groups of Ireland. The direction of the range is from northeast to southwest, and the highest elevations are generally attained along the central line. The range consists of long sweeping moorlands, rising occasionally by precipitous escarpments into culminating points, the highest summits being Kippure (2473 feet), Duff Hill (2369), Douce Hill (2384), and Lugnaquilla (3039). The range rises from the north by a succession of ridges intersected by deep glens, and subsides towards the borders of Wexford and Carlow. Though the range is metamorphic, it is also in part intrusive, and its formation has been accompanied by a considerable elevation of Silurian rocks, beyond which it does not penetrate, notwithstanding that the Cambrian rocks occupy a large tract along the sea coast. In the valleys there are many instances of old river terraces, the more remarkable being those at the lower end of Glenmalure and the lower end of Glendalough. It is in its deep glens that much of the peculiar charm of Wicklow scenery is to be found, the frequently rugged natural features contrasting finely with the rich and luxuriant foliage of the extensive woods which line their banks. Among the more famous of these glens, are the Dargle, Glencree, Glen of the Downs, Devil's Glen, Glenmalure, Glen of Ismail, and the beautiful vale of Ovoca. The eastern districts of the county are occupied by clay slate or quartzite, the latter of which presents frequently a smooth polished surface and shows indications of Glacial erosion. Evidences of Glacial action also appear in the moraines of Glenmalure and Glendalough. The principal rivers are the Liffey, on the northwestern border; the Vartry, which passes through Devil's Glen to the sea north of Wicklow Head; the Avonmore and the Avonbeg, which unite at the "meeting of the waters" to form the Ovoca, which is afterwards joined by the Aughrim and falls into the sea at Arklow; and the Slaney, in the west of the county, passing southwards into Carlow. There are a number of small but romantic lakes in the valleys, the principal being Loughs Dan, Bray, and Tay or Luggelaw, and the loughs of Glendalough.

Minerals.—Lead is raised at Lugganure (near Rathdrum), the principal lead mine in Ireland. In 1796 gold was discovered near Croghan Kinshela, but not in quantities to render working remunerative. Auriferous silver occurs in the slaty strata. There are important copper mines at Ovoca, where sulphur and iron are also dug. Slates for roofing are quarried at Dunganstown and elsewhere. Limestone, limestone gravel, and marl are obtained near the sea and in the river valleys.

Agriculture.—According to the latest landowners' return, Wicklow was divided among 1041 proprietors, possessing 497,656 acres, at an annual valuation of £254,800 [$1,238,328], or about 10s. 2⅗d. [$2.49] per acre. There were also about 2500 acres of waste land. Of the proprietors 534, or rather more than a half, possessed less than 1 acre each. The following possessed over 8000 acres each: William Kemmis, 8042; J. S. Moore, 8731; R. A. G. Cunninghame, 10,479; earl of Meath, 14,718; marquis of Downshire, 15,766; earl of Carysfort, 16,292; J. Mandeville Hugo, 17,937; earl of Wicklow, 22,104; marquis of Waterford, 26,035; Viscount Powerscourt, 36,693; and earl Fitzwilliam, 89,891. The climate near the sea is remarkably mild, and permits the myrtle and arbutus to grow. The land in the lower grounds is fertile; and, although the greater part of the higher districts is covered with heath and turf, it affords good pasturage for sheep. There is a considerable extent of natural timber, as well as artificial plantations. Out of a total area of 499,894 acres in 1886, 105,642 or 21.1 per cent. were under crops, 234,890 or 47 per cent. under grass, 175 acres fallow, 19,479 or 3.9 per cent. woods and plantations, 29,028 or 5.8 per cent. bog and marsh, 94,347 or 18.9 per cent. barren mountain land, and 16,333 or 3.3 per cent. water, roads, fences, etc. The total number of holdings in 1886 was only 8072 and their size is much above the average for Ireland, 70 being above 500 acres in extent, 973 between 100 and 500 acres, 2615 between 30 and 100 acres, 2646 between 5 and 30 acres, 855 between 1 and 5 acres, and 913 not exceeding 1 acre each. Between 1849 and 1886, the area under crops decreased from 126,251 to 105,642 acres; but within the last ten years the decrease was not so marked, the area in 1876 being 111,488 acres. The area under meadow and clover has been gradually increasing: in 1849, it was 50,793 acres, and, while in 1876 it was 60,086 acres, in 1886 it was 60,390. The area under green crops shows very slight fluctuations: in 1849 it was 18,837 and in 1886 it was 18,114. Potatoes and turnips, which occupied respectively 10,847 and 5304 acres in 1886 have not perceptibly altered in the proportions of the areas. The decrease in the area under corn crops has, on the other hand, been remarkable; from 56,616 acres in 1849 it fell to 31,361 in 1876 and to 27,129 in 1886. The area under wheat in 1849 was 7817 acres, but between 1876 and 1886 it decreased from 3639 to 814 acres. The area under oats has decreased from 44,527 acres in 1849 to 26,920 in 1876 and 25,344 in 1886; the area under barley, bere, and other corn crops being in these years 4272, 1480, and 971 acres respectively. The number of horses in 1886 was 11,300 (of which 7206 were used for agricultural purposes), asses 3465, mules 351, cattle 81,577 (of which 24,523 were milch cows), sheep 169,334, pigs 22,329, and goats 6278.

Communication.—The Dublin, Wicklow, and Wexford Railway skirts the coast from Bray to the town of Wicklow, after which it bends westward to Rathdrum, and then passes by the vale of Ovoca to Arklow. At Wooden Bridge a branch goes off southwestwards to Shillelagh.

Manufactures and Trade.—Except in the Ovoca district, where the mining industry is of some importance, the occupations are chiefly agricultural. The manufacture of flannel, which formerly gave employment to a considerable number of people, is now in a very depressed condition. Herring and round fish are caught off the coast, but these fisheries are much neglected. There is, however, a rather prosperous oyster fishery at Arklow. Of late years the harbor at Wicklow has been improved, the bed of the river deepened, and a steam-packet pier erected.

Administration and Population.—According to De Burgo's estimate, the population of Wicklow in 1760 amounted to 43,872; the parliamentary census of 1812 placed it at 83,109; by 1821 it had increased to 110,767, and by 1841 to 126,143, but by 1861 it had diminished to 86,451, by 1871 to 78,697, and by 1881 to 70,386 (males 35,101, females 35,285).

Roman Catholics in 1881, numbered 79.9 per cent. of the population, Protestant Episcopalians 18.3 (an unusually large proportion for the south of Ireland), Presbyterians 0.4, Methodists 1.0, and other denominations 0.4. The number of persons who could read and write numbered 57.4 of the population, able to read only 12.8 per cent., illiterate 29.8. There were none who could speak Irish only, and the number who could speak Irish and English was 243. Wicklow, which formerly returned two members to parliament, was in 1885 formed into two parliamentary divisions, an eastern and a western, each returning one member. The principal towns are part of Bray (4387), a fashionable watering-place, the other part (2148) being in Dublin; Wicklow (3391), the county town; and Arklow (4777), a fishing-station of some importance. The county is divided into eight baronies and contains fifty-nine parishes. According to the Protestant Episcopal arrangements, it is in the dioceses of Dublin and Glendalough, with portions in those of Leighlin and Ferns. It is in the home or Leinster circuit; and assizes are held at Wicklow and quarter-sessions at Bray, Baltinglass, Tinahely, Arklow, and Wicklow. There are ten petty sessions districts within the county, and portions of four others. It includes two poor-law unions and portions of the unions of Naas, Rathdown, and Shillelagh. It is in the Dublin military district.

History and Antiquities.—On the division of the district of the Pale by King John into twelve counties Wicklow was included in Dublin county. It was made a separate county by James I. in 1605. It sided with the royal cause during the Cromwellian wars, but on Cromwell's advance submitted to him without striking a blow. During the rebellion of 1798, some of the insurgents took refuge within its mountain fastnesses. An engagement took place between them and General Holt near Aughrim, which was speedily decided in Holt's favor; a second was fought at Arklow between them and General Needham with a similar result. Of the ancient cromlechs there are three of some interest, one near Enniskerry, another on the summit of Lugnaquilla, and a third, with a druidical circle, at Donoughmore. There are comparatively unimportant monastic remains at Rathdrum, Baltinglass, and Wicklow. The ruins in the vale of Glendalough, known as the "seven churches," are, with the doubtful exception of Clonmacnoise, the most remarkable ecclesiastical remains in Ireland. They owe their origin to St. Kevin, who lived in the vale as a hermit, and is reputed to have died on 3d June, 618. On the site of St. Kevin's cell an extensive monastic establishment was founded, and around it a town sprang up, which was long famed as a seat of learning. The buildings which constitute the "seven churches" are the round tower, one of the finest in Ireland, 110 feet in height and 51 in circumference; St. Kevin's kitchen or church, of which the nave, 25 feet by 15, with a curious high-pitched roof and a round belfry (supposed to be the earliest example of a round belfry springing from the roof or gable), still remains; a structure within the cemetery called the cathedral, in a state of great dilapidation, but from its position and dimensions seemingly well entitled to its name; the lady chapel, chiefly remarkable for its doorway of wrought granite, in a style of architecture allied to the Greek; Trinity church, consisting of nave (29 feet 6 inches by 17 feet 6 inches), chancel (13 feet 6 inches by 9 feet), and a basement story, and presenting some of the finest characteristics of the ancient architecture of Ireland, including a very beautiful specimen of the square-headed doorway; the monastery, or St. Saviour's abbey, with peculiar ornamental sculpture, and supposed to contain the tomb of St. Kevin; and the Refeart or cemetery church. In the cemetery and all along the valley there are a large number of monuments and stone crosses of various size and style. The cave known as St. Kevin's bed shows evidence of having been artificially constructed, but is probably only an enlarged natural cavity. Of the old fortalices or strongholds associated with the early wars those of special interest are Black Castle, near Wicklow, originally founded by the Norse invaders, but taken by the Irish in 1301, and afterwards rebuilt by William FitzWilliam; the scattered remains of Castle Kevin, the ancient stronghold of the O'Tooles, by whom it was probably originally built in the 12th century; and the ruins of the old castle of the Ormondes at Arklow, founded by Theobald FitzWalter (died 1285), the scene of frequent conflicts up to the time of Cromwell, by whom it was demolished in 1649, and now containing within the interior of its ruined walls a constabulary barrack. The fine mansion of Powerscourt occupies the site of an old fortalice founded by De la Poer, one of the knights who landed with Strongbow; in the reign of Henry VIII. it was taken by the O'Tooles and O'Brynes. (T. F. H.)

WIDDIN, or Widin, a fortified town of Bulgaria, within 20 miles of the Servian frontier and about 130 miles southeast of Belgrade, in 44° N. lat. and 22° 50′ E. long. It occupies a strong position on the right bank of the Danube over against the Roumanian town of Kalafat, with which it is connected by a bridge of boats over a mile long. Owing to its low situation the soil is marshy and the city is liable to inundation (six floods having occurred since 1839). Its population in 1888 amounted to 13,435, including 6929 Bulgarians, 3387 Turks, and 1304 Jews. The citadel, always a formidable stronghold, has recently been strengthened and enlarged with a double line of ramparts reaching to the water's edge, while on the land side the approaches are naturally protected by the extensive marshy tracts formed here by a sharp bend of the Danube from the east to the south. The old town within these lines was formerly inhabited exclusively by Mohammedans, and still presents an Oriental aspect, with its mosques, minarets, and over 1700 stalls lining the bazaar or main thoroughfare of Plevna Ulica. There are a few local industries, such as the making of gold and silver filigree work, saddlery, beer, flour, and cutlery, besides a brisk riverine trade, mainly in the hands of the Jews and Bulgarians. The fisheries in the Danube are of some importance (£20,000 [$97,200] annually).

Widdin stands on the site of the Roman town of *Bonomia* in Mœsia Superior, not to be confounded with the Pannonian Bononia, which stood higher up the Danube to the north of Sirmium. Its name figures conspicuously in the military annals of mediæval and recent times; and it is specially memorable for the overthrow of the Turks by the imperial forces in 1689 and for the crushing defeat of the hospodar Michael Sustos by Pasvan Oglu in 1801. It was again the scene of stirring events during the Russo-Turkish wars of 1854–55 and 1877–78, and successfully resisted the assaults of the Servians in the Servo-Bulgarian War of 1886–87.

WIDNES, a manufacturing town of Lancashire, England, is situated on the Mersey, where it is joined by the Sankey Brook Navigation, and on the London and Northwestern Railway, 13 miles southeast of Liverpool and 188 from London. Capacious private docks were constructed in 1866 and extended in 1884. The Mersey is crossed by a wrought-iron bridge, 1000 feet long and 95 in height, completed in 1868, and having two lines of railway and a footpath. The church of St. Mary was erected in 1856, that of St. Ambrose in 1880, and that of St. Paul in 1884. Widnes is one of the principal seats of the alkali and soap manufacture, and has also grease-works for locomotives and wagons, copper-works, iron-foundries, oil and paint works, and sail-cloth manufactories. It is governed by a local board of fifteen members. Until comparatively recent years it was a small township, dependent chiefly on agriculture. It 1851 the population was under 2000, but by 1861 the numbers had more than trebled. In 1871 the population of the urban sanitary district (area 3339 acres) was 14,359, and 24,935 in 1881; in 1888 it was estimated to exceed 30,000.

The barony of Widnes came from the Lacy family to the dukes of Lancaster and thence to the crown. In 1554–55 it was declared to be part of the duchy of Lancaster.

WIELAND, Christopher Martin (1733–1813), German man of letters, was born on the 5th September, 1733, at Oberholzheim, a Swabian village near Biberach, then an imperial city. He was carefully educated by his father, who was a clergyman at Oberholzheim; and at a very early age he gave evidence of a strong literary impulse. In his fourteenth year he was sent to the school of Klosterbergen, near Magdeburg, where he attracted a good deal of attention, not only by his knowledge of the classics and of French and English literature, but by his power of lucid and graceful expression. When he was about sixteen he left school and went to live with a relative at Erfurt, who undertook to prepare him for the university by reading with him the writings of the philosopher Wolff. Having spent a year and a half with this relative, he went for some time to Biberach, whither his father had been transferred from Oberholzheim. At Biberach he met a young kinswoman, Sophie Gutermann, with whom he fell in love, and who exercised a powerful influence upon the development of his intellect and imagination. While talking with her, after they had heard his father preach a sermon on the text "God is Love," he conceived the scheme of his first poem, *Die Natur der Dinge.* In 1750 he went to the university of Tübingen, nominally for the purpose of studying law; but in reality he devoted his attention wholly to literature. At Tübingen he wrote his poem on the *Nature of Things*, and in 1752 it was published anonymously. Here also he wrote *Anti-Ovid*, *Lobgesang auf den Frühling*, *Moralische Briefe*, and *Moralische Erzählungen.* At home Wieland had been strictly brought up, and his home training had been confirmed at the Klosterbergen school, the head-master of which was a member of the straitest sect of the Pietists. In his early writings, therefore, Wieland appears as a youth of a deeply serious disposition, with an ardent enthusiasm for what he conceives to be the highest ideas of theology and ethics.

Bodmer, the Swiss critic and poet, strongly attracted by this new literary force, cordially invited Wieland to visit him at Zurich. Wieland accepted the invitation, and lived for many months in Bodmer's house. In 1754 the two friends parted; for, although they had apparently the same aims and motives, they were in reality very unlike one another, and Bodmer was apt to play rather too ostentatiously the part of a guide and patron. Wieland continued to reside in Switzerland, remaining in Zurich about five years and in Bern about a year, and supporting himself by working as a tutor. During the early part of his residence in Switzerland Wieland maintained the serious tone that had marked his first writings. In his *Briefe von Verstorbenen an hinterlassene Freunde*, *Sympathien*, *Empfindungen eines Christen*, and other works of this period he sought to give expression to the loftiest spiritual aspirations; and in the letter in which he dedicated the *Empfindungen* to the court preacher Sack, in Berlin, he went out of his way to rebuke the frivolity of certain Anacreontic poets, whom he denounced as "a band of epicurean pagans." But Wieland's mystical and ascetic doctrines did not at all correspond to his real impulses, and soon after he left Bodmer's house he began to feel that he had misunderstood his own character. His piety became less enthusiastic, and he learned to have a keen appreciation of pleasures which he had formerly condemned as incompatible with any high or worthy conception of the ends of human life. This change led to a kind of literary activity wholly different from that by which he had made his reputation. He wrote two dramas, *Johanna Grey* (in which he made free use of Rowe's play *Lady Jane Grey*) and *Clementina von Poretta;* and he chose as the subject of an epic poem the career of Cyrus, who was to be presented as a hero closely resembling Frederick the Great. *Cyrus* he never finished; but he completed *Araspes und Panthea*, a poem in which he developed an episode from the *Cyropædiæ* of Xenophon.

In 1760 he settled at Biberach as director of the chancery. The appointment was a poor one, and for a time Wieland found life at Biberach extremely dull and tiresome. By and by, however, he made the acquaintance of Count Stadion, an experienced man of the world, at whose house Wieland became a constant visitor; there he met, among many other persons whose society he liked, his first love, Sophie, who had married Von Laroche, the count's confidential friend and "factotum." Under these new influences the change of tone which had been begun in Switzerland was soon completed; and in *Don Sylvio von Rosalva* (1764), a romance, intended to be taken as an imitation of *Don Quixote*, he gave himself the pleasure of laughing at principles and sentiments which he had formerly held to be sacred. This work was followed by *Komische Erzählungen* (1766), the cynical grossness of which far surpassed that of any contemporary German writer. Wieland himself seems to have felt that in these tales he had gone too far, for, although in his next work, *Agathon* (1766–67), the hero of which is a disciple of Plato, he sometimes treads on slippery ground, his ultimate aim is to show that the true rule of life is to hold the balance even between the spiritual and the physical impulses of man. His unfinished *Idris und Zenide* (1768) has a less worthy motive; but in the didactic poem *Musarion* (1768) he returned to the idea of *Agathon*, that fanaticism and sensuality are equally opposed to enduring happiness, and that he is most to be envied who knows how to gratify all legitimate impulses without allowing any of them to become unduly powerful. To Wieland, when his mind and character were fully developed, this law of conduct seemed to be the highest to which man can attain, and he was never tired of indirectly expounding it in his later writings. At Biberach he devoted much time to the study of Shakespeare, and in 1762–66 he published, in eight volumes, translations of twenty-two of Shakespeare's plays.

In 1765 Wieland had married a lady of Augsburg, to whom he was warmly attached. Four years afterwards he was made professor of philosophy at Erfurt, where he remained until 1772. During his stay at Erfurt he wrote *Dialogen des Diogenes von Sinope; Beiträge zur geheimen Geschichte des menschlichen Verstandes und Herzens, aus den Archiven der Natur; Der goldene Spiegel; Die Grazien*, a didactic poem; *Combabus*, a disagreeable tale in verse; and *Der neue Amadis*, a comic poem in eighteen cantos.

In 1772 Wieland settled for life at Weimar, his position at first being that of a tutor to the two sons of the duchess Anna Amalia. Here he founded the monthly periodical, *Der Deutsche Mercur*, which he edited until 1796. For this periodical he wrote constantly, and, considering the immense number of his productions, it is surprising that he was able to maintain, on the whole, so high a level of excellence. By far the best of his works is the poem *Oberon*, the only work by him which has still a wide circle of readers in Germany. It was published in 1780. Among other original writings produced in Weimar may be named a comic romance, *Die Geschichte der Abderiten* (1774), *Der verklagte Amor* (1774), *Das Wintermärchen* (1776), and *Das Sommermärchen* (1777). In 1782 and 1786 appeared translations of the *Epistles* and *Satires* of Horace; and in 1788 and 1789 he issued a translation of Lucian, his study of whom led to his writing *Neue Göttergespräche* (1791), *Geheime Geschichte des Philosophen Peregrinus Proteus* (1791), and *Agathodämon* (1799). From 1793 to 1802 he was engaged in issuing a revised edition of his writings; but in 1796 he found time to establish a new periodical, *Das Attische Museum* in which he printed, among other things, translations of some of the comedies of Aristophanes. In 1797 Wieland bought Osmannstädt, an estate near Weimar; and there he lived for some years with his large family. At Osmannstädt he wrote his last important romance, *Aristipp und einige seiner Zeitgenossen* (1800–2). In 1801 his wife died, and two years afterwards he sold his estate and returned to Weimar, where he spent his last years in translating and annotating the *Letters* of Cicero. He died on 20th January, 1813.

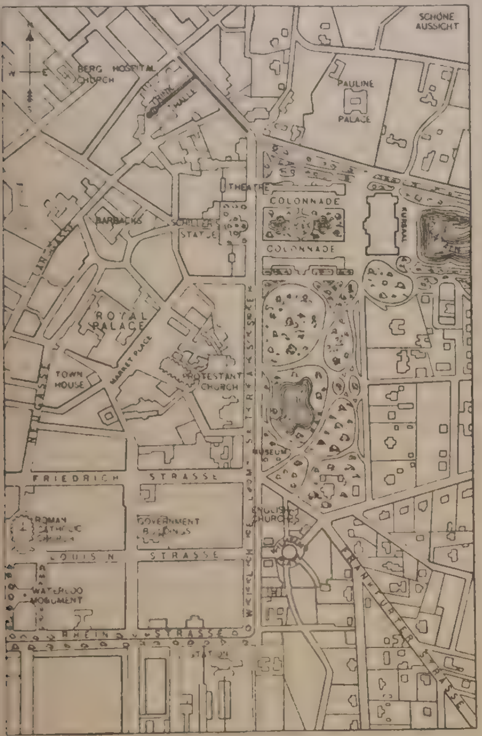
Wieland was a man of many moods, and his friends, when talking with him, could never be quite sure that they would not unintentionally offend him. But, although vain and over-sensitive, he often gave evidence of an essentially humane and generous spirit. As a writer he lacked force of imagination and depth of feeling; and even at his best he had too narrow a range of vision to be a great moral teacher. Nevertheless, he has an important place in the history of German literature. He was the founder in Germany of the psychological romance, and few of his successors in this kind have surpassed his delicate and subtle analyses of complicated motives. Both in prose and in verse he was a master of the art of composition, and most of the younger writers of his day learned something from the clearness, ease, and grace of his style. To him belongs the merit of having first[1] suggested to his countrymen that it might be worth their while to study their native literature as well as that of France, England, and Italy.

Wieland's *Collected Works*, edited by Gruber, were issued in 53 vols. in 1818–1828 and in 36 vols. in 1851–56. There are biographies of him by Gruber (1827–28), Loebell (1858), and Ofterdingen (1877). Much light is thrown on his character by his letters; see *Ausgewählte Briefe* (1815–16) and *Briefe an Sophie Laroche* (1820).

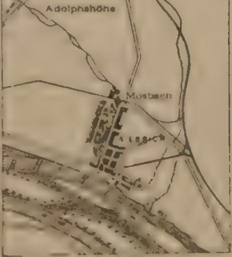
(J. SI.)

WIENER NEUSTADT. See NEUSTADT.

WIESBADEN, capital of the former duchy of Nassau and now the chief town of a district in the province of Hesse-Nassau in Prussia, disputes with Baden-Baden the title to be considered the most frequented and most fashionable watering-place in Germany. It is situated in a small and fertile valley on the south-west slope of Mount Taunus, 5 miles to the north of Mainz and 3 miles from the Rhine (see the subjoined plan). The town is neat and well-built, with broad and regular streets. Its prosperity is entirely owing to its hot springs; and the general character and appearance of the place, with its numerous hotels, lodging-houses, villas, bath houses, promenades and places of entertainment, are dictated by the requirements of the visitors, who number annually about 60,000. The principal buildings are the palace, built in 1837–42 and restored in 1882; the Cursaal, a large and handsomely fitted up establishment, built in 1810, and adjoined by a beautiful and shady park; the Protestant church, built of polished bricks in 1852–60, with five tall towers, in the Gothic style; the Roman Catholic church; the new synagogue in the Moorish style; the museum, with a picture gallery, a collection of antiquities, and a library of 70,000 volumes; the theatre; the Berg church; and the Russian chapel, erected on the Neroberg in 1855. Wiesbaden contains numerous scientific societies and educational institutions, including a well-known chemical laboratory. The thermal springs contain only ½ per cent. of salt, and very little carbonic acid; and a good deal of their efficacy is due to their high temperature, which varies from 156° to 142° Fahr. The water is generally cooled to 93° Fahr. for bathing. The principal spring is the Kochbrunnen (156° Fahr.), the water of which is drunk by sufferers from gout, chronic dyspepsia, obesity, etc. There are twenty-eight other springs used for bathing, and efficacious in cases of rheumatism, gout, scrofula, and nervous ailments. The town lies 320 feet above the sea-level. Its climate is mild and warm, so that even in winter it is frequented by from 5000 to 6000 visitors. The population in 1885 was 55,457; in 1816 it was 4608; in 1867, 30,085.



Plan of Wiesbaden.



Environs of Wiesbaden.

Wiesbaden is one of the oldest watering-places in Germany, and may be regarded as the capital of the Taunus spas. The springs mentioned by Pliny as *Fontes Mattiaci*, were known to the Romans, who appear to have fortified the place. Under the Carolingian monarchs it was the site of a palace. Otho I. made it a town. The name Wisibada appears in 830. Though the springs never passed out of knowledge, they did not attain their greatest repute until the close of the 18th century. From 1771 till 1873 Weisbaden was a notorious gambling resort; but in the latter year public gambling was suppressed by the Prussian Government.

See *Geschichte und historiche Topographie der Stadt Wiesbaden*, by F. W. C. Roth, and *Balneologische Studien über Wiesbaden*, ed. by Dr. Pfeiffer, both published at Wiesbaden in 1883, and both containing copious bibliographical lists.

WIFE. See HUSBAND AND WIFE, and WOMEN.

WIG.[2] Artificial hair appears to have been worn from very ancient times, as is testified by well-made wigs recovered from Egyptian mummy figures. The full and flowing locks which adorn the sculptured reliefs of human figures found at Nineveh also suggest that wigs were not unknown among the ancient Assyrians. In the 16th century the fashion of wearing false hair became prevalent among ladies in Europe. At one period Elizabeth of England was possessed of no fewer than eighty attires of false hair. Mary of Scotland throughout her life was also in the habit of varying the attires of hair she wore; and much of the confusion which has arisen in connection with her portraits is traceable to this circumstance.[3] The periwig of the 16th century was, however, merely false hair worn like, and sometimes with, the real hair, as an adornment or to supply the defects of nature. It was not till the 17th century that the peruke was worn as a distinctive feature of costume; as such it was first employed by Louis XIII. when his hair failed. His successor, Louis XIV., did not adopt it till 1673. In the meantime it had been freely donned by courtiers and gallants of the era. Charles I. of England, while in Paris on his way to Spain, "shadowed himself the most he could under a burly peruque, which none in former days but bald-headed people used." The wearing of the peruke became general in the days of Charles II. Pepys records that he parted with his own hair; and "paid £3 [$14.65] for a periwigg"; and on going to church in one he says, "it did not prove so strange as I was afraid it would." About this time the peruke is described as "a counterfeit hair which men wear instead of their own, a thing much used in our days by the generality of our men, contrary to their forefathers." The wig obtained its maximum development during the reign of Queen Anne, who was patroness of the full-bottomed wig,—a huge head-dress which covered the back and shoulders and floated down over the chest. In 1724 the peruke-makers advertised "full-bottom tyes, full bobs, minister's bobs, naturals, half naturals, Grecian flyes, curley roys, airey levants, qu perukes, and bagg wiggs" among the variety of artificial head-gear which they supplied. Early in the reign of George III. the general fashion of wearing wigs began to wane and gradually died out; but among professional men the practice continued to hold its place, and it was by slow degrees that military officers and clergymen gave up the habit. The wig of the 17th century now holds its place only on the judicial bench, and with the speaker of the English House of Commons, barristers and advocates; but even on the bench its use is being threatened. Wigs of course continued to be worn by many to make up for natural deficiencies; and on the stage the wig is, as in all times, an indispensable adjunct. Many of the modern stage wigs are made of jute, a fibre which lends itself to marvellously perfect imitations of human hair.

---

[1] Lessing undoubtedly was the emancipator of German literature. For his and Wieland's relative place see vol. x. p. 479. —Am. Ed.]

[2] Shortened from *periwig*, a lengthened form (through the Dutch, of *peruke*. This word is extant in all the Romance languages (Ital. *parrucca*, or, in Sardinian, *pilucca*; Span. *peluca*; Portug. *peruca*; Fr. *perruque*; Walloon *perik*) and is derived from *pelo* (*pilus*).

[3] Whilst a prisoner in Lochleven Castle she received "plusieurs perruques et aultres choses y servant"; and there was sent after her to Carlisle "ung paque de perruques de cheveux." Her maid, Mary Seton, was a skilled busker, and, according to Sir F. Knollys, "she did set such a curled hair upon the queen that was said to be a perwyke, that shewed very delicately, and every other day she hath a new device of hair dressing." Even on the scaffold, according to an eye-witness, she wore "borrowed heire aburne," her own hair being "polled very short."

WIGAN, a municipal and parliamentary borough and market-town of Lancashire, England, is situated on the river Douglas and on the main line of the London and Northwestern railway, 18 miles west-northwest of Manchester, 18 northeast of Liverpool, and 195 northwest of London. The Douglas is spanned by several bridges, and is connected with the Leeds and Liverpool Canal. There is also a branch canal by Leigh and Worsley to Manchester. The older portions of the town occupy the north bank of the river, the modern additions being chiefly on the south bank. The church of All Saints, Late Perpendicular, consisting of chancel with aisles and two chapels, was restored in 1630 and again in 1847. There are six other ecclesiastical parishes. The principal public buildings are the Royal Albert Edward Infirmary and Dispensary (1873, enlarged 1884), the public hall (1853), the borough courts and offices (1866), the arcade (1872), the market-hall (1877), the free public library (1878), the public baths (1882), and the county justices courts and offices (1888). The educational institutions include the free grammar school (founded by James Leigh in 1619 and rebuilt in 1876), the mining and mechanical school, and the mechanics' institution. The charities are numerous but of small individual importance, their aggregate annual value amounting to about £2500 [$12,150]. A public park of 27 acres was opened in 1878. The town owes much of its prosperity to its coal mines, which afford employment to a large proportion of the inhabitants and supply fuel for the factory furnaces. Mills for making hats were established at Wigan in 1482; and subsequently bell-founding and pottery-making were of some importance. The chief industry is now the manufacture of cotton fabrics; the town also possesses iron forges, iron and brass foundries, oil and grease works, railway wagon factories, and bolt, screw, and nail works. The population of the municipal and parliamentary borough (area 2188 acres) was 20,774 in 1831; by 1861 it had increased to 37,658, by 1871 to 39,110, and by 1881 to 48,194 (23,508 males and 24,686 females); in 1888 it was estimated at 55,000.

Wigan is situated at the junction of three Roman roads, and there was a ford across the river where Millgate now stands. Many Roman coins have been found in the neighborhood; hence it is supposed that Wigan was an important Roman station. Numerous Danish barrows also exist in the neighborhood. After the Conquest Newton (in which Wigan is situated) was bestowed on Roger de Poictou, but on account of his rebellion was forfeited to the crown. The rectory of Wigan existed before 1243, and the rector as lord of the manor received a charter for the town in the 30th year of Henry III. Wigan was a city of refuge for runaway slaves during the Middle Ages. It was one of the 120 boroughs selected to send members to parliament in 1306; but the privilege lay dormant until 1547. From the charter it received in the 24th year of Edward III., confirming its liberties, it is evident that it was already an important market town, while its fairs were on a large scale and regulated by special laws. It also received charters from Richard II. and Charles II. Leland refers to it as a paved town "as bigge as Warrington, and better builded." Camden describes it as "neat and plentiful." Wigan contributed £50 [$275.75] of ship-money to Charles I. in 1636. On the outbreak of the Civil War in 1642 it was occupied by the earl of Derby, and formed the central garrison for the king in Lancashire; but the entrenchments were taken by Sir John Seaton in 1643 after a desperate battle. It was again repossessed by the earl of Derby, but was retaken by Colonel Ashton in March, when the outworks and fortifications were demolished. On 25th August, 1651, the earl of Derby was defeated at Wigan by Colonel Lilburne, when Sir Thomas Tyldesley was slain. A memorial pillar to Tyldesley was erected in 1679 and restored in 1882. The town was governed by a mayor, recorder, 12 aldermen and 2 bailiffs till the charter of 2d William IV. Under the Municipal Act it was divided into five wards, and is governed by a mayor, recorder, 10 aldermen, and 30 councillors. It has a commission of the peace and a separate court of quarter sessions. In 1885 the number of its parliamentary representatives was reduced to one.

See Sinclair's *History of Wigan*, 1882.

WIGEON (French *Vigeon*, from the Latin[1] *Vipio*),[2] also called locally "Whewer" and "Whew" (names imitative of the whistling call-note of the male), the *Anas penelope* of Linnæus and *Mareca penelope* of many modern ornithologists, one of the most abundant species of Ducks throughout the greater part of Europe and northern Asia, reaching northern Africa and India in winter. A good many pairs breed in the north of Scotland; but the nurseries of the vast numbers which resort in autumn to the waters of temperate Europe are in Lapland or farther to the eastward. Comparatively few breed in Iceland.

Intermediate in size between the Teal and the Mallard, and less showy in plumage than either, the drake Wigeon is a beautiful bird, with the greater part of his bill blue, his forehead cream-color, his head and neck chestnut,[3] passing into pinkish gray below and above into lavender-gray, which last, produced by the transverse undulations of fine black and white lines, extends over the back and upper surface of the wings, except some of the coverts, which are conspicuously white, and shows itself again on the flanks. The wings are further ornamented by a glossy green speculum between two black bars; the tail is pointed and dark; the rest of the lower parts is white. The female has the inconspicuous coloration characteristic of her sex among most of the Duck tribe. In habits the Wigeon differs not a little from most of the *Anatinæ*. It greatly affects tidal waters during the season of its southern stay, and becomes the object of slaughter to hundreds of gunners on the coasts of Britain and Holland; but when it resorts to inland localities, as it also does to some extent, it passes much of its time in grazing, especially by day, on the pastures which surround the lakes or moors that it selects.

The Wigeon occurs occasionally on the eastern coast of North America, and not uncommonly, it would seem, on the Pribyloff Islands in the Pacific. But the New World has two allied species of its own. One of them, *M. americana* (a freshly killed example of which was once found in a London market), inhabiting the northern part of that continent, and in winter reaching Central America and the West Indian islands as far as Trinidad, wholly resembles its Old-World congener in habits and much in appearance. But in it the pale frontlet and the rich chestnut are mingled into, as it were, a compromise of light warm brown, the white wing-coverts are wanting, and nearly all the plumage is subdued in tone. The other species, *M. sibilatrix* or *chiloensis*, inhabits the southern portion of South America and its islands, from Chili on the west to the Falklands on the east, and is easily recognized by its nearly white head, nape glossy with purple and green, and other differences. (A. N.)

---

[1] [*Skeat's Dictionary* gives the usual form Widgeon, and assumes that the French form is of Teutonic and not Latin origin.—AM. ED.]

[2] Just as PIGEON (*q.v.*) is from *Pipio*. Other French names, more or less local, are, according to M. Rolland, *Vignon*, *Vingeon*, *Wagne*, *Woinge*, *Wignet*, *Wuiot*, *Vioux*, and *Digeon*. In some parts of England the small teasing flies, generally called midges, are known as "wigeons."

[3] Hence come the additional local names "Bald-pate" and "Red-head."

WIGHT, Isle of, a small island in the English Channel, situated off the coast of Hampshire, between 50° 35′ and 50° 46′ N. lat. and 1° 34′ and 1° 5′ W. long. (see vol. xi. Pl. VII.). It forms a portion of the county of Hampshire, and is separated from the mainland by a narrow strait, the Solent and Spithead. The island is, roughly speaking, diamond-shaped, the shorter diameter, from north to south, measuring 13 miles, and the longer, from east to west, 23 miles. The area is 92,931 acres, or about 145 square miles. The most prominent feature in its physical geography is a range of high chalk downs running from east to west across the centre of the island, and terminating in the Culver and Freshwater cliffs respectively. This range is broken through in the centre by the valley of the Medina, which flows due north and is the only river of consequence in the island ; it is navigable up to Newport. A second smaller range of chalk downs occurs in the south near Ventnor. Along the south coast, extending from St. Catherine Point to Ventnor, there is the remarkable district known as the Undercliff, celebrated for its wild and romantic beauty and for its mild climate. It is sheltered from the north by a line of high cliffs. North of the central chalk range the country is for the most part flat and well-wooded. Parkhurst Forest, where timber is grown for the use of the British navy, is 3000 acres in extent. The geology of the island affords within a small area abundant opportunities for studying many different formations. The uppermost of the strata represented in the island is the Eocene, and the lowest the Wealden. All the strata between these two may be studied in good sections, and very numerous and interesting fossils may be collected. The various Eocene beds are exhibited along the north coast, and may also be studied to great advantage in White Cliff and Alum Bays. In the neighborhood of Gurnet Bay there is a very remarkable bed, containing beautifully-preserved remains of insects and spiders. In Alum Bay, in the extreme west, the strata are vertically disposed and consist of a very curious series of colored sands and clays. Here also the junction between the Eocene and the underlying Chalk is admirably shown. The central range of chalk downs is part of the northern slope, and the downs behind the Undercliff are part of the southern slope of a lesser anticlinal axis, the upper portion of the Chalk strata having been denuded in such a way as to expose the underlying Greensand, of which the greater portion of the southern half of the island is composed. The Greensand formation may best be studied in the cliff section from Atherfield Point to Rocken End. Beneath the Greensand the Wealden is exposed in the section from Brook to Atherfield, and also, to a much less extent, in Sandown Bay. The Wealden strata have yielded abundant fossil remains of extinct reptiles (*Iguanodon*), especially in the neighborhood of Brook and Cowleaze Chines ; and at Brook Point an extensive fossil forest exists, being the remains of a great raft of timber floated down and deposited in estuarine mud at the mouth of a great river. At Brook also the characteristic Wealden mollusk, *Unio valdensis*, occurs abundantly.

The climate is mild and relaxing, and enjoys the reputation of being peculiarly salubrious. In winter and spring, however, the east winds are very trying, and in summer the heat is at times very great. The climate of the Undercliff is especially mild, and a large consumption hospital (the Royal National Hospital for Consumption and Diseases of the Chest), arranged on the cottage principle, has been established here. Partly owing to the mildness of the climate, and partly to the beauty of the scenery, the island has long been a favorite resort of tourists, and within recent years several fashionable watering-places have sprung up. Of these the principal are Cowes, at the mouth of the Medina, the headquarters of the Royal Yacht Squadron, Ryde (11,461 inhabitants in 1881), Bembridge, Sandown, Ventnor (5739), Shanklin (1780), Freshwater (2809), and Yarmouth (787). Newport (9357), on the Medina, is the capital of the island, but is comparatively little frequented by visitors. Hitherto many parts of the island have been more or less inaccessible owing to the deficiency of railways; but it is being rapidly opened up, and a railway is now in course of construction between Newport, Carisbrooke, Yarmouth, and Freshwater. There are few industries in the island. The population is chiefly agricultural, a large proportion of the land being devoted to sheep-grazing. Fishing is also carried on to a considerable extent on the south coast,—lobsters, crabs, and prawns being plentiful. Oyster cultivation has been attempted in the Medina, in Brading Harbor, and in the Newtown river. At Cowes shipbuilding is carried on, and on the Medina there are cement-works. In the towns, however, the chief occupation of the inhabitants consists in providing for the wants of the summer visitors; in winter very little business is done. The island is divided into two liberties, East and West Medina, excluding the two boroughs of Newport and Ryde; and it forms one petty and special sessional division of the county. Until 1885 there was one member of parliament for the island and one for the borough of Newport; now, however, there is only one member for the whole island. Episcopally the island has for many centuries belonged to the see of Winchester. In 1881 the population was 73,633, as against 66,219 in 1871.

History.—The Isle of Wight (Roman *Vectis*) was originally inhabited by Celts, and was conquered for the emperor Claudius by Vespasian in 43. The Romans remained in possession for four centuries. In 530 it was conquered by Cerdic and Cymric and added to the kingdom of Wessex. Later on it again became free from the control of Wessex and remained independent until the inhabitants of their own accord submitted to Edward, the son of Alfred. William the Conqueror gave the island as an independent lordship to William Fitz-Osborne, but it was again forfeited to the crown on the rebellion of his son, the earl of Hereford. Henry I. gave the lordship to Richard de Redvers, in whose family it remained until 1293, when Isabella de Fortibus, the lady of the island, sold it to Edward I. Richard II. again appointed a lord of the island, and the office continued until the reign of Henry VII., when it was finally abolished. From that date onwards the government has been vested in a captain or governor, whose office is now honorary. Charles I. was confined in Carisbrooke Castle for some time in 1647–8. The antiquities include the British pit villages near Rowborough, the Celtic tumuli on several of the chalk downs, the long stone at Mottistone, the Roman villas near Brading and Carisbrooke, the ruins of Quarr Abbey, and numerous ancient churches. Carisbrooke Castle, almost in the centre of the island, is a fine old ruin built upon the site of an ancient British stronghold. The British fortifications were probably occupied as a camp by the Romans under Vespasian, and they were subsequently held by the Saxons, who made the high mound known as the keep. The inner walls of the castle were erected in the 11th century, and the outer defences were constructed in the reign of Elizabeth. The Roman villa near Brading contains some beautiful and well-preserved examples of tesselated pavements; that at Carisbrooke is smaller and not so interesting.

WIGTOWN, or Wigton, a maritime county in the southwest corner of Scotland, forming the western division of the old district of Galloway, is bounded N. by the Irish Channel and Ayrshire, E. by Kirkcudbright and Wigtown Bay, S. by the Irish Sea, and W. by the Irish Channel. It is of very irregular form. Its greatest breadth, east and west, is about 33 miles and its greatest length, north and south, about 26 miles. The area is 310,742 acres or 485½ square miles.

Physical Features.—The coast-line has a total length of about 120 miles. On the eastern boundary the estuary of the Cree expands into Wigtown Bay. Between Wigtown and Luce Bays is the peninsula of the Machers, of which Burrow Head is the southern extremity. Luce Bay has a length of about 15 miles and an average breadth of 12. By its indentation on the south and that of Loch Ryan (about 9 miles long and nearly 3 broad) on the north the two-pronged peninsula of the Rinns is formed, of which the Mull of Galloway, the most southerly point in Scotland, is the southern extremity, and Kirkcolm Point the northern. The coast is more or less precipitous, with many small inlets, few of which, on account of dangerous hidden rocks, afford suitable landing-places for vessels. Loch Ryan forms, however, a splendid natural harbor, of which Stranraer is the port. Portpatrick on the Irish Channel is the nearest port in Great Britain to Ireland, and 7 miles to the south is Port Logan. With the exception of Port William on its eastern shore, Luce Bay is destitute of harbors. Wigtown Bay includes on the Wigtown side the small harbors of the Isle of Withorn, Garliestown, Wigtown, and Carty, but the upper portions of the bay are not navigable at low water. The county is occupied almost solely by Silurian Strata, its characteristic feature being a series of rocky hills, which extend more or less over the whole county, attaining their highest elevation in the north, on the borders of Ayrshire. A considerable number range between 400 and 800 feet in altitude, the highest summits being Miltonish (970 feet), on the northern border, and Craigairie Fell (1000 feet) in Kirkcowan parish. A great part of the county has a wild and bleak appearance, the hills being covered with heath and whins, while in the lower parts there are long stretches of bog and moss. The Silurian rocks are in some parts interpenetrated by small areas of granite; and immense granite boulders are occasionally scattered over the lower grounds, doubtless the result of the Glacial action of the Kirkcudbrightshire ice bed. Along the western edge of Loch Ryan there is a narrow band of Carboniferous strata, consisting of sandstones which have been classed as calciferous. They rest unconformably on a narrow belt of Permian strata separating them from the Silurian rocks. In the Carboniferous strata various plant impressions are met with. Between Luce Bay and Loch Ryan, and on the upper shores of Wigtown Bay, there are raised beaches. Galena, copper pyrites, and barytes have been found in small quantities; gray shales for roofing slates and flags for pavement are dug at Cairn Ryan on the eastern-shores of Loch Ryan, where sandstone is also quarried for building purposes; from the clays in the neighborhood of Stranraer bricks are manufactured. Owing to the irregular hilly character of the county the streams, though numerous, are generally small. The Cree, forming the boundary with Kirkcudbrightshire, flows past Newton Stewart and Carty into Wigtown Bay; the Bladenoch, from Loch Maberry on the Ayrshire border, falls into Wigtown Bay at the town of Wigtown, after having received the Tarf, the Malzie, and the Black Burn; and the Luce, formed by the junction of the Main Water and the Cross Water at New Luce, flows south into Luce Bay. There are a very large number of lochs, but none of them very extensive, the principal being the beautiful one in Inch parish included in the grounds of Castle Kennedy, Lochs Maberry and Dornal on the Ayrshire border, Loch Connel in Kirkcolm parish, Loch Ronald in Kirkcowan parish, and Castle Loch and the four lochs of Mochrum in Mochrum parish. Dowaltown Loch, at the junction of Kirkinner, Sorbie, and Glasserton parishes, was drained in 1862.

Agriculture.—Although the rainfall exceeds the average in Scotland, the climate is not specially unfavorable for the ripening of crops, and frosts are not generally of long continuance. A considerable portion of Wigtownshire consists of stony moors, which have insufficient soil to render reclamation possible. Along the shores there is some extent of gravelly soil, which, however, requires heavy manuring to render it fruitful. Where the higher districts are arable a rocky soil prevails, better adapted for grass and green crops than for corn crops. A large extent of the county is black top reclaimed from moors; in other districts loam and clay prevail. The most common method of cropping is a six years' shift of oats, green crops, corn crop, and three years' grass. According to the *Agricultural Returns* for 1887, the arable area was 147,063 acres or about 46 per cent. of the whole, considerably above the average for even the lowland counties of Scotland. The area under corn crops was 37,392 acres, of which 35,511 were under oats. The latter area has not materially changed within the last thirty years, the chief diminution having been in wheat, which in 1855 occupied 7343 acres and in 1887 only 736. Barley and bere in 1887 occupied 796 acres, rye 38, and beans 310. The bulk of the green crops consists of turnips and swedes, occupying in 1887 15,678 acres, whilst 1902 acres were potatoes, 229 mangold, 100 carrots, 153 cabbage, etc., and 135 vetches. There were 69,326 acres under clover and rotation grasses and 21,883 under permanent pasture. In 1881 (the latest return) there were over 8009 acres under woods, and in 1887 there were 40 under nursery grounds, 6 under market gardens, and 7 under orchards. The large area under grass and turnips is owing to the general prevalence of dairy farming. In 1887 the number of cattle was 42,062, of which 21,197 were milch cows, a number exceeded in only four other counties in Scotland, although in the number of its cattle it is surpassed by ten counties. The Galloway cattle, a black polled breed, are now chiefly confined to the eastern districts, the Ayrshire being found a much more suitable breed for dairy purposes. In some cases Galloway bulls are kept for breeding with Ayrshire cows. Many dairy farms send milk to Glasgow and the neighboring towns; but the manufacture of cheese has greatly increased within late years, large cheese factories having been established. Dunlop is now almost wholly superseded by Cheddar cheese. Horses, chiefly Clydesdale, for which breed Wigtownshire has acquired some fame, numbered 5699 in 1887; sheep, chiefly blackfaced on the hilly farms, and in other districts crosses with Leicesters and other long-woolled breeds, numbered 116,264; and pigs 10,380. From 1345 returns obtained from occupiers of land in 1887, out of 147,104 acres 142,266 were rented and occupied and 4838 owned and occupied. The following table gives a classification of agricultural holdings according to size in 1880 and 1885:

Year.	50 acres and under.		50 to 100 acres.		100 to 200 acres.		200 to 500 acres.		500 to 1000 acres.		Above 1000 acres.		Total.	
	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.
1880	608	9241	208	16,090	422	74,576	88	32,638	20	12,271	1	1210	1347	146,026
1885	597	8778	216	15,851	421	75,837	91	34,426	18	11,186	1	1220	1344	147,298

According to the latest landowners' *Return*, the county was divided among 1820 proprietors, possessing 309,087 acres at an annual value of £230,589 [$1,120,662.54], or about 14s. 11d. [$3.62] per acre. Of the proprietors 1674 possessed less than one acre each. The following owned over 5000 acres each: earl of Stair, 79,174; E. J. S. Blair, 37,268; earl of Galloway, 23,203; marquis of Bute, 20,157; Sir W. Maxwell, 16,877; James M'Douall, 16,290; Sir Andrew Agnew, 12,962; D. Hunter Blair, 8255; William Maitland, 7848; Sir J. Dalrymple Hay, 7400; R. Vans Agnew, 6777; W. C. S. Hamilton, 6300; Mrs. S. O. McTaggart, 5998; Lieut.-Col. Sir W. T. F. Agnew Wallace, 5785; and R. H. J. Stewart, 5552.[1]

Communication.—The Portpatrick Railway crosses the county from Newton Stewart by Kirkcowan, Glenluce, and Stranraer to Portpatrick. From Newton Stewart the Wigtownshire Railway passes south by Wigtown and Garliestown to Whithorn. The Girvan and Portpatrick Railway branches off from the Portpatrick line at East Challoch near Dunragit and passes northwards by New Luce. There is a line of steamers to Ireland by Portpatrick.

Manufactures and Trade.—Although agriculture is the main industry, there is a variety of small manufactures in the towns, including a woollen factory at Kirkcowan, engineering and locomotive works at Stranraer, hand-loom weaving in various places, distilling, tanning, and currying. The fishing industry is of almost no account. There is, however, an oyster fishery in Loch Ryan, and herrings are caught in Loch Ryan and the Bay of Luce. The value of the salmon fisheries, including those of the rivers, is less than £1000 [$4860] a year.

---

[1] For further particulars regarding the agriculture, see a paper by W. H. Ralstone, in *Trans. Royal and Highland Agric. Soc.*, vol. xvii., new ser. (1885).

Administration and Population.—From 22,918 in 1801 the population had by 1821 increased to 33,240 and by 1851 to 43,389; but it declined to 42,095 in 1861, to 38,830 in 1871, and to 38,611 (males 18,143, females 20,468) in 1881. In point of density Wigtown stands twenty-first among the counties of Scotland, the number of persons to the square mile being 79. The proportion of females to every 100 males was 112.82, the largest proportion of any county with the exceptions of Orkney and Shetland and Forfar. The number of persons who could speak Gaelic was only twenty-eight. The town population in 1881 numbered 9060, the village 8574, and the rural 20,977. The county has three royal burghs—Wigtown (1789), Stranraer (3455), and Whithorn (1643). The last two are also police burghs (Stranraer, 6342). Part (2645) of the police burgh of Newton Stewart is within the county, the remainder being in Kirkcudbrightshire. Newton Stewart is also a burgh of barony, as are likewise Glenluce (901) and Portpatrick (591). The county returns one member to parliament. Formerly Wigtown, Stranraer, and Whithorn formed with New Galloway a group of burghs returning one member, but by the Act of 1885 they were merged in the county. The county includes seventeen parishes. Wigtownshire is in the same sheriffdom as the counties of Kirkcudbright and Dumfries. Sheriff courts are held during certain periods at Wigtown and Stranraer, and quarter sessions are held at Wigtown and Glenluce.

History and Antiquities.—The portion of Galloway now forming Wigtownshire was in early times occupied chiefly by the Novantæ. When the district was overrun by the Romans under Agricola in 82, they fixed their headquarters at Whithorn (*Leucophibia*), and one of their principal stations, *Rerigonium*, was on the eastern shore of Loch Ryan. The Devil's dyke, a defensive work of the Romans, extended from Loch Ryan to the upper part of the Solway Firth. A sketch of the early history of Galloway, including Wigtownshire, is given under KIRKCUDBRIGHT (vol. xiv. p. 99). The district was the scene of the labors of the Christian missionary St. NINIAN (*q.v.*), who arrived at Whithorn (*Candida Casa*) towards the close of the 4th century. Whithorn was a bishop's see from 727 till the Reformation. In addition to the caves on the sea coast, which, like those of Kirkcudbrightshire, are associated with early human occupation, the ancient inhabitants have left traces of themselves in cairns, standing stones, hut circles, and remains of ancient villages. Numerous early relics have also been dug up, including flint and other stone implements, as well as a great variety of ancient bronze implements and ornaments.[1] The Dowalton crannogs were the first lake dwellings discovered in Scotland, and are among the most remarkable in the country.[2] Among the ancient fortalices may be mentioned the sea towers of Carghidown and Castle Feather, south of Whithorn; the ruins of Baldoon, south of Wigtown, associated with events which suggested to Scott the tale of the *Bride of Lammermoor;* the tower of Corsewall near the west shore of Loch Ryan; the foundations of a Norse stronghold in Cruggleton Bay; Dunskey at the head of Castle Bay, built in the 16th century, but occupying the site of an ancient fortress; the fragments of Long Castle at Dawalton Loch, the ancient seat of the McDoualls; the castle of Mochrum and Myrtoun Castle, the seat of the Maccullochs, in Mochrum parish; and the ruined tower of Sorbie, the ancient keep of the Hannays. Of the Cistercian abbey of Glenluce, founded in 1190 by Roland, lord of Galloway, the principal remains are the chapter house in the Decorated style, the walls of the cloister, and a small portion of the church in the Early English style. The ancient cathedral of Whithorn, though in a dilapidated condition, forms a picturesque ruin, and near it are some slight remains of the ancient priory founded by St. Ninian. The Dominican priory of Wigtown, founded in 1267, has, like the ancient castle, entirely disappeared; and only some slight mounds remain of Saulseat abbey, founded for Premonstratensians by Fergus, lord of Galloway, in 1148. Wigtown was probably created a sheriffdom in the 13th century. In 1341 the earldom of Wigton, which included the whole of the county, with the jurisdiction of a regality, was bestowed upon Sir Malcolm Fleming. In 1372 the earldom was purchased by Archibald Douglas, who the same year was created lord of Galloway. In the reign of James I. William Douglas of Leswalt was sheriff of Wigtown and keeper of the castle of Lochnaw; but in 1426 the constableship of Lochnaw, with the sheriffdom of Wigtown, was acquired by Andrew Agnew. These dignities continued to be held by the Agnew family till 1682, when Sir Andrew Agnew refused to take the test and was superseded by Graham of Claverhouse. At the Restoration in 1688 the office of sheriff was restored to the Agnew family, and they held it till the abolition of hereditary jurisdictions in 1747. The principal modern mansions are Galloway House, built in 1740, the seat of the earls of Galloway; Castle Kennedy, built by the first earl of Stair after the destruction of the old castle by fire in 1716; the baronial castle of Lochnaw, including, with large modern additions, the battlemented tower of the ancient building; and Barnbarroch House, the seat of R. Vans Agnew.

See Symson, *Description of Galloway*, 1823; Murray, *Literary History of Galloway*, 1882; Sir Andrew Agnew, *Hereditary Sheriffs of Galloway*, 1864; *Histories of Galloway*, by Mackenzie, 1841, and P. H. Mackerlie, 1870-78. (T. F. H.)

WILBERFORCE, SAMUEL (1805–1873), bishop of Oxford and afterwards of Winchester, was the third son of William WILBERFORCE (see below), and was born at Clapham Common near London on 7th September, 1805. Until he entered Oriel College, Oxford, in 1823, he was educated privately. In the "United Debating Society," which afterwards developed into the "Union," Wilberforce distinguished himself as a zealous advocate of liberalism. The set of friends with whom he chiefly associated at Oxford were sometimes named, on account of their exceptionally decorous conduct, the "Bethel Union"; but he was by no means averse to amusements, and especially delighted in hurdle jumping and hunting. He graduated in 1826; and the summer and autumn of 1827 were spent in a Continental tour. After his marriage on 11th June, 1828, to Emily Sargent, he was in December ordained and appointed curate-in-charge at Checkenden near Henley-on-Thames. In 1830 he was presented by Bishop Sumner of Winchester to the rectory of Brightstone in the Isle of Wight. In this comparatively retired sphere he soon found scope for that manifold activity which so prominently characterized his subsequent career. In 1831 he published a tract on tithes, "to correct the prejudices of the lower order of farmers," and in the following year a collection of hymns for use in his parish, which had a large general circulation; a small volume of stories entitled the *Note Book of a Country Clergyman;* and a sermon, *The Apostolical Ministry.* He now began to be sought for as a preacher and declined several offers of appointments. In February, 1836, he was made a rural dean. At the close of 1837 he published the *Letters and Journals* of Henry Martyn. Although a High Churchman Wilberforce held aloof from the Oxford movement, and in 1838 his divergence from the "Tract" writers became so marked that J. H. Newman declined further contributions from him to the *British Critic,* not deeming it advisable that they should longer "co-operate very closely." In 1838 Wilberforce published, with his elder brother Robert, the *Life* of his father, and two years later his father's *Correspondence.* In 1839 he also published *Eucharistica* (from the old English divines), to which he wrote an introduction *Agathos and other Sunday Stories*, and a volume of *University Sermons*, and in the following year *Rocky Island and other Parables.* In November, 1839, he was installed archdeacon of Surrey, in August, 1840, collated canon of Winchester, and in October he accepted the rectory of Alverstoke. In 1841[3] he was chosen Bampton lecturer, and shortly afterwards made chaplain to the Prince Consort, an appointment he owed to the impression produced by a speech at an anti-slavery meeting some months previously. In October, 1841, he was appointed by the archbishop of York to be sub-almoner to the Queen. In 1844 appeared his *History of the American Church.* In March of the following year he accepted the deanery of Westminster, and in October the bishopric of Oxford.

[2] See CRANNOGS, vol. vi. 489; and for descriptions of these and other lake dwellings in Wigtownshire, consult a paper by Robert Monro, in *Ayr and Wigton Arch. Coll.*, vol. v., and "Notes on Crannogs and Lake Dwellings of Wigtonshire," by Rev. G. Wilson, in *Proceedings Soc. Antiq. Scot.*, vol. ix. pp. 368–378 and x. 737–739.

[3] [This choice was made in 1840 for lectures to be delivered next year, but the service never was performed. The chaplaincy to the prince came in December, 1840. See *Life, ut infra*, pp. 161–2. —AM. ED.]

The bishop in 1847 became involved in the Hampden controversy, and signed the remonstrance of the thirteen bishops to Lord John Russell against Dr. Hampden's appointment to the bishopric of Hereford. He also endeavored to obtain satisfactory assurances from Dr. Hampden; but, though unsuccessful in this, he withdrew from the suit against him. The publication of a papal bull in 1850 establishing a Roman hierarchy in England brought the High Church party, of whom Wilberforce was the most prominent member, into temporary disrepute. The secession to the Church of Rome of his brother-in-law, Archdeacon (now Cardinal) Manning, and afterwards of his two brothers, brought him under further suspicion, and his revival of the powers of convocation lessened his influence at court; but his unfailing tact and wide sympathies, his marvellous energy in church organization, the magnetism of his personality, and his eloquence, both on the platform and in the pulpit, gradually won for him recognition as without a rival on the episcopal bench. In the House of Lords he took a prominent part in the discussion of social and ecclesiastical questions. He has been styled the "bishop of society"; but society occupied only a fraction of his time. The great bent of his energies was ceaselessly directed to the better organization of his diocese and to the furtherance of schemes for increasing the influence and efficiency of the church. In 1854 he opened a theological college at Cuddesdon, which was afterwards the subject of some controversy on account of its alleged Romanist tendencies. His attitude towards *Essays and Reviews* in 1861, against which he wrote an article in the *Quarterly*, won him the special gratitude of the Low Church party, and latterly he enjoyed the full confidence and esteem of all except the extreme men of either side and party. On the publication of Colenso's *Commentary on the Romans*, in 1861, Wilberforce endeavored to induce the author to hold a private conference with him; but after the publication of the first two parts of the *Pentateuch Critically Examined* he drew up the address of the bishops which called on Colenso to resign his bishopric. In 1867 he framed the first *Report* of the Ritualistic Commission, in which coercive measures against ritualism were discountenanced by the use of the word "restrain" instead of "abolish" or "prohibit." He also endeavored to take the sting out of some resolutions of the second Ritualistic Commission in 1868, and was one of the four who signed the *Report* with qualifications. Though strongly opposed to the disestablishment of the Irish Church, yet, when the constituencies decided for it, he prudently advised that no opposition should be made to it by the House of Lords. After twenty-four years' labor in the diocese of Oxford, he was named by Mr. Gladstone for the bishopric of Winchester. His unremitting labors had, however, seriously told on his constitution, and the change to a new diocese, entailing a repetition of the work of organization which he had completed in the old one, proved too much for his health. The result was a severe affection of the heart, which on more than one occasion threatened to prove fatal. He was killed on 19th July, 1873, by the shock of a fall from his horse near Dorking, Surrey.

Besides the works already mentioned, Wilberforce wrote *Heroes of Hebrew History* (1870), originally contributed to *Good Words*, and several volumes of sermons. See *Life of Samuel Wilberforce, with Selections from his Diary and Correspondence*, vol. i., ed. by Ashwell, and vols. ii. and iii., ed. by his son Reginald G. Wilberforce.

WILBERFORCE, WILLIAM (1759-1833), whose name is chiefly associated with the abolition of the slave trade, was descended from a Yorkshire family which possessed the manor of Wilberfoss in the East Riding from the time of Henry II. till the middle of the 18th century. He was the only son of Robert Wilberforce, member of a commercial house at Hull, by his wife Elizabeth, daughter of Thomas Bird of Barton, Oxon, and was born at Hull on 24th August, 1759. It was from his mother that he inherited both his feeble frame and his many rich mental endowments. He was not a diligent scholar, but at the grammar school of Hull his skill in elocution attracted the attention of the master. Before he had completed his tenth year he lost his father and was transferred to the care of a paternal uncle in London; but in his twelfth year he returned to Hull, and soon afterwards was placed under the care of the master of the endowed school of Pocklington. Here his love of social pleasure made him neglectful of his studies; but he entered St. John's College, Cambridge, in October, 1766. Left by the death of his grandfather and uncle the possessor of an independent fortune under his mother's sole guardianship, he was somewhat idle at the university, though he acquitted himself in the examinations with credit; but in his serious years he "could not look back without unfeigned remorse" on the opportunities he had then neglected. In 1780 he was elected to the House of Commons for his native town, his success being due to his personal popularity and his lavish expenditure. He soon found his way into the fast political society of London, and at the club at Goosetrees renewed an acquaintance begun at Cambridge with Pitt, which ripened into a friendship of the closest kind. In the autumn of 1783 he set out with Pitt on a tour in France; and after his return his eloquence proved of great assistance to Pitt in his struggle against the majority of the House of Commons. In 1784 Wilberforce was elected for both Hull and Yorkshire, and took his seat for the latter constituency.

A journey to Nice in the autumn of the same year with Dr. Isaac Milner led to his conversion to Evangelical Christianity and the adoption of more serious views of life. The change had a marked effect on his public conduct. In the beginning of 1787 he busied himself with the establishment of a society for the reformation of manners. About the same time he made the acquaintance of Thomas Clarkson, and began the agitation against the slave trade. Pitt entered heartily into their plans, and recommended Wilberforce to undertake the guidance of the project as a subject suited to his character and talents. While Clarkson conducted the agitation throughout the country, Wilberforce took every opportunity in the House of Commons of exposing the evils and horrors of the trade. In 1788, however, a failure of his digestive powers compelled him to retire for some months from public life, and the introduction of the subject in parliament therefore devolved on Pitt, whose representations were so far successful that an Act was passed providing that the number of slaves carried in ships should be in proportion to the tonnage. On 12th May of the following year Wilberforce, in co-operation with Pitt, brought the subject of abolition again before the House of Commons; but the friends of the planters succeeded in getting the matter deferred. On 27th January following Wilberforce carried a motion for referring to a special committee the further examination of witnesses, but after full inquiry the motion for abolition in May, 1791, was lost by 163 votes to 88. In the following April he carried a motion for gradual abolition by 238 to 85 votes; but in the House of Lords the discussion was finally postponed till the following session. Notwithstanding his unremitting labors in educating public opinion and annual motions in the House of Commons, it was not till 1807, the year following Pitt's death, that the first great step towards the abolition of slavery was accomplished. When the anti-slavery society was formed in 1823, Wilberforce and Clarkson became vice-presidents; but before their aim was accomplished Wilberforce had retired from public life, and the Emancipation Bill was not passed till August, 1833, a month after his death.

In 1797 Wilberforce published *A Practical View of the Prevailing Religious System of Professed Christians in the Higher and Middle Classes of this Country Contrasted with Real Christianity*, which within half a year went through five editions and was afterwards translated into French, Italian, Dutch, and German. Shortly after the appearance of this work he occupied himself with a plan for a religious periodical which should admit "a moderate degree of political and common intelligence," the result being the appearance in January, 1801, of the *Christian Observer*. He also interested himself in a variety of schemes for the advancement of the social and religious welfare of the community, including the establishment of the Association for the Better Observance of Sunday, the foundation, with Hannah MORE (*q.v.*), of schools at Cheddar, Somersetshire, a project for opening a school in every parish for the religious instruction of children, a plan for the education of the children of the lower classes, a bill for securing better salaries to curates, and a method for disseminating, by Government help, Christianity in India. In parliament he was a supporter of parliamentary reform and of Catholic emancipation. In 1812, on account of failing health, he exchanged the representation of Yorkshire for that of a constituency which would make less demands on his time, and was returned for Bramber. In 1825 he retired from the House of Commons, and the following year settled at Highwood Hill, "just beyond the disk of the metropolis." He died at London on 29th July, 1833, and was buried in Westminster Abbey close to Pitt, Fox, and Canning. In Westminster Abbey a statue was erected to his memory, and in Yorkshire a county asylum for the blind was founded in his honor. A column was also erected to him by his townsmen of Hull.

See *Life of William Wilberforce*, by his sons, 1838, 5 vols.; *Correspondence*, 2 vols., 1840.

WILDBAD, a watering-place in the northwest of Würtemberg, is picturesquely situated in the romantic pine-clad gorge of the Enz, 28 miles west of Stuttgart and 14 east of Baden-Baden. Its thermal alkaline springs have a temperature of 90°–100° Fahr., and are used for bathing in cases of rheumatism, gout, neuralgia, and similar ailments (see MINERAL WATERS, vol. xvi. p. 452). The fact that the springs rise within the baths, and are thus used at the fountain-head, is considered to contribute materially to their curative influence. The system of bathing in common is customary at Wildbad, although of course separate baths may be obtained. The water is applied internally for affections of the stomach and digestive organs, and of the kidneys, bladder, etc. Wildbad possesses all the usual arrangements for the comfort and amusement of the visitors (over 6000 annually), including large and well-appointed hotels, a curhaus, a trink-halle, and promenades. The neighborhood is picturesque, the most attractive spot being the Wildsee, of which many legends are told. The population of the town in 1885 was 3514.

WILFRID (*c.* 634–709), archbishop of York from 665 till 709, was born of good parentage in Northumbria, *c.* 634. When nearly fourteen years of age he was sent away from a harsh stepmother to serve in King Oswy's court, where he attracted the notice of the queen, Eanfled. She, fostering his inclination for a religious life, placed him under the care of an old noble, Cudda, who had betaken himself to a monastic life at Lindisfarne. Later on Eanfled enabled him to visit Rome under the protection of Benedict Biscop, the son of a Northumbrian, or rather Anglian noble. At Lyons Wilfrid's pleasing features and quick intelligence made Dalfinus, or Aunemund, the archbishop, desire to adopt him and marry him to his niece. Resisting his offers, the youth went on to Rome, received the papal benediction, and then, in accordance with his promise, returned to Lyons, where he stayed for three years, till the murder of his patron (? 656), whose fate he would have shared had not his beauty stayed the hand of the executioners. On his return home, Oswy's son Alchfrid gave him a monastery at Ripon, and before long Bishop Agilbert of Paris[1] ordained him priest. He was probably already regarded as the leading exponent of the Roman discipline in England when his speech at the council of Whitby determined the overthrow of the Celtic party (664). About a year later he was consecrated to the see of York (not in England, where perhaps he could not find the fitting number of orthodox prelates, but at Compiègne). On his return journey he narrowly escaped the pagan wreckers of Sussex, and only reached his own country to find he had been supplanted in his see. The rest of his life is a record of wandering and misfortune. For three years (665–668) he ruled his monastery at Ripon in peace, occasionally, however, exercising his episcopal functions in Mercia and Kent. On Archbishop Theodore's arrival (668) he was restored to his see, but only to be driven out through the anger of King Egfrid's queen (677). Theodore now divided Wilfrid's large diocese into three; and the aggrieved prelate went to lay his case before the bishop of Rome. On his way he narrowly escaped murder at the hands of foreign princes, whom his own countrymen had stirred up against him. A synod held at Rome under Agatho (?679) ordained his restitution; but even a papal decision could not prevent his being cast into prison on his return home. When released he wandered first to Mercia, whence Egfrid once more drove him forth to Sussex. Here he rescued the pagan folk from an impending famine, and established a bishop's see at Selsea. After Egfrid's death (20th May, 685) Wilfrid was restored to York and Ripon (686–687). He was once more driven out in 691–692, and after appealing to Rome in person obtained another decision in his favor (703–704). Despite the intercession of Berghtwald, archbishop of Canterbury, Egbert's brother Aldfrid refused to admit the aged prelate into his kingdom till his last illness (705). This year or the next a council was held near the river Nidd, the papal letters were read, and, despite the opposition of the bishops, Wilfrid once more received the abbeys of Ripon and Hexham. Not long after he died at Oundle (Northamptonshire) as he was going on a visit to Ceolred, king of Mercia (709). He was buried at Ripon, whence, according to Eadmer, his bones were afterwards removed to Canterbury.

Wilfrid's is a memorable name in English history, not only because of the large part he played in supplanting the Celtic discipline and in establishing a precedent of appeal to papal authority, but also by reason of his services to architecture and learning. At York he renewed Paulinus's old church, roofing it with lead and furnishing it with glass windows; at Ripon he built an entirely new basilica with columns and porches; at Hexham in honor of St. Andrew he reared a still nobler church, over which Eddius grows eloquent. In the early days of his bishopric he used to travel about his diocese attended by a little troop of skilled masons. He seems to have also reformed the method of conducting the divine services by the aid of his skilled chanters, Ædde and Æonan, and to have established or renewed the rule of St. Benedict in the monasteries. On each visit to Rome it was his delight to collect relics for his native land; and to his favorite basilica at Ripon he gave a bookcase wrought in gold and precious stones, besides a splendid copy of the Gospels. As a missionary his success was extraordinary, and even on his way to Rome in 679 he found time to convert the Frisian king, Aldgislus, though the latter had been bribed to slay him by the offer of "a measure of gold solidi." Later in life he ordained Suidbert as the first bishop of Frisia. In earlier years his influence was so great that he supplied the Franks with one of their later Merovingian kings, Dagobert II.

[1] [Then a migrant bishop of Dorchester in Wessex, afterwards (668) bishop of Paris.—AM. ED.]

Wilfrid's life was written shortly after his death by Eddius at the request of Acca, his successor at Hexham, and Tatbert, abbot of Ripon,—both intimate friends of the great bishop. Other lives were written by Frithegode in the 10th, by Folcard in the 11th, and by Eadmer early in the 12th century. The dates have to be supplied mainly from Bede's *Hist. Eccl.*, iii. c. 25, etc., 13, etc., v. 19, etc. All the lives are printed in Raine's *Historians of the Church of York*, vol. i. (Rolls Series).

WILHELMSHAVEN, or WILHELMSHAFEN, the chief naval station and war harbor of Germany on the North Sea, is situated on the east[1] side of the Jahde, a large basin united with the sea by a channel 3 miles long. The ground on which it stands was purchased by Prussia from the duke of Oldenburg in 1853, and though reckoned a part of the province of Hanover is completely surrounded on the landward side by Oldenburg territory. The town is laid out on a regular and ample scale, and the streets are wide and shaded with trees. A statue has been erected to Admiral Prince Adalbert of Prussia (d. 1873). Most of the inhabitants, who numbered 13,972 in 1885, including 1326 Roman Catholics, are connected with the dockyard and fleet; and there is an additional colony of dockyard employés at Bant (3000 inhabitants), on Oldenburg soil.

The original harbor, constructed in 1855–69, consists of an inner and outer basin. To the southeast of the inner harbor, which is used by war-vessels not in active service, a large new harbor has recently been constructed for war-vessels in commission and for commercial purposes. The entrance to both the old and the new harbor is sheltered by long and massive moles. A torpedo harbor has also been formed. The inner harbor and the adjacent docks, building-slips, machine-shops, etc., form the Government dock-yard, which is enclosed by a lofty wall with fourteen iron gates. The whole establishment is defended by strong fortifications.

WILKES, JOHN (1727–1797), the champion of the right of free representation by British constituencies, was descended from a family long connected with Leighton-Buzzard in Bedfordshire, but he himself was born at Clerkenwell, London, on 17th October, 1727. His father, Israel Wilkes, was a rich distiller, and the owner, through his wife Sarah, daughter of John Heaton of Hoxton, of considerable house property in its northeastern surburbs. After some training under private tuition John Wilkes was sent to the university of Leyden, matriculating there on 8th September, 1744. Several young men of talent from Scotland and England were studying in this Dutch university at that period, and a lively picture of their life, in which Wilkes displays the gayety of temper which remained faithful to him all his days, is presented to us by "Jupiter" Carlyle. With this training he acquired an intimate knowledge of classical literature, and he enlarged his mind by travelling through Holland, Flanders, and part of Germany. At the close of 1748 he returned to his native land, and in a few months (October, 1749) was drawn by his relations into marrying Mary, sole daughter and heiress of John Mead, citizen and grocer of London, who was ten years his senior. The ill-assorted pair,—for she was grave and staid, while he rioted in exuberant spirits and love of society,—lived together in the country for some months, when, to make matters worse, they returned to town to dwell with the wife's mother. One child, a daughter, was born to them, when Wilkes left his wife and removed to Westminster, where he kept open house for many young men about town possessing more wit than morals. To this unfortunate marriage should in justice be attributed some of his errors in life. In 1754 he contested the constituency of Berwick-upon-Tweed, but failed to gain the seat. Wilkes was now a well-known figure in the life of the West End, and among his associates were Thomas Potter, the son of the archbishop of Canterbury, Sir Francis Dashwood, afterwards Lord le Despencer, and Lord Sandwich, the last of whom in after years showed great animosity towards his old companion in revelry. In July, 1757, by a triangular arrangement in which Potter and the first William Pitt played the other parts, Wilkes was elected for Aylesbury, and for this constituency he was again returned at the general election in March, 1761. Pitt was his leader in politics; but to Pitt he applied in vain for a seat at the board of trade; nor was he successful in his other applications for office. Stung by these disappointments, Wilkes threw himself into bitter opposition to Bute, and to make his antagonism more effective established a paper called *The North Briton*, in which he from the first attacked the Scotch prime minister with exceeding bitterness, and grew bolder as it proceeded in its course. One of its articles ridiculed Lord Talbot, the steward of the royal household, and a duel was the result. When Bute resigned, the issue of the journal was suspended; but, when the royal speech framed by George Grenville's ministry showed that the change was one of men only, not of measures, a supplementary number, No. 45, was published 23d April, 1763, containing a caustic criticism of the king's message to his parliament. Lord Halifax, the leading secretary of state, issued a general warrant "to search for authors, printers, and publishers," and to bring them before him for examination. Charles Churchill, the poet, and a coadjutor in this newspaper enterprise, escaped through the good offices of Wilkes; but the chief offender was arrested and thrown into the Tower. A week later, however, he was released by order of the Court of Common Pleas on the ground that his privilege as a member of parliament afforded him immunity from arrest. General warrants were afterwards declared illegal, and Halifax himself after a series of discreditable shifts was cast in heavy sums, on actions brought against him by the persons whom he had injured,—the total expenses incurred by the ministry in these lawless proceedings amounting to at least £100,000 [$486,000]. So far Wilkes had triumphed over his enemies, but he gave them cause for rejoicing by an indiscreet reprint of the obnoxious No. 45, and by striking off at his private press thirteen copies of an obscene *Essay on Woman*, written by his friend Potter, in parody of Pope's *Essay on Man*, one of which got into the hands of Lord Sandwich. Immediately on the meeting of the House of Commons (15th November, 1763) proceedings were taken against him. Lord North moved that No. 45 was "a false, scandalous, and seditious libel," and, as the motion was of course carried, the paper was publicly burnt in Cheapside on 4th December. The *Essay on Woman* was brought before the Upper House by Lord Sandwich, and, on account of the improper use which had been made of Bishop Warburton's name as the author of some coarse notes, the work was voted a breach of privilege, and Wilkes was ordered to be prosecuted in the Court of King's Bench for printing and publishing an impious libel. He was expelled from the House of Commons on 19th January, 1764; and on 21st February he was found guilty in the King's Bench of reprinting No. 45 and of printing and publishing the *Essay on Woman*. Wilkes was on these dates absent from England. Some strong expressions applied to him by Samuel Martin, an ex-secretary of the treasury, had provoked a duel (16th November, 1763), in which Wilkes was severely wounded in the stomach. He withdrew to Paris, and and as he did not return to England to receive his sentence in the law courts was pronounced an outlaw.

For several years Wilkes remained abroad, receiving £1000 [$4860] a year from the leading Whigs, and in the course of his travels he visited many parts of Italy. In March, 1768, he returned to London and sued the king for pardon, but in vain. His next step was to offer himself as a candidate for the representation of the City of London, when he was the lowest at the poll. Undaunted by this defeat, he solicited the freeholders of Middlesex to return him as their champion, and they placed him at the head of all competitors. He appeared before the King's Bench, and on a technical point procured a reversal of his outlawry; but the original verdict was maintained, and he was sentenced to imprisonment for twenty-two months as well as to a fine of £1000 [$4860], and he was further ordered to produce securities for good behavior for seven years after his liberation. His conduct was brought before the House of Commons, with the result that he was expelled from the House on 3d February, 1769, and with this proceeding there began a series of contests between the ministry and the electors of Middlesex without parallel in English history. They promptly re-elected him (16th February), only to find him pronounced incapable of sitting and his election void. Again they returned him (16th March) and again he was rejected. A fourth election then followed, when Colonel Henry Lawes Luttrell, with all the influence of the court and the Fox family in his favor, obtained but 296 votes to 1143 given for Wilkes, whereupon the House declared that Luttrell had been duly elected. Through these audacious proceedings a storm of fury broke out throughout the country. In the cause of "Wilkes and liberty" high and low enlisted themselves. His prison cell was thronged daily by the chief of the Whigs, and large sums of money were subscribed for his support. So great was the popular sympathy in his favor that a keen judge of contemporary politics declared that, had George III. possessed a bad and Wilkes a good character, the king would have been an outcast from his dominions. At the height of the combat in January, 1769, Wilkes was elected an alderman for the City of London; in 1771 he served as sheriff for London and Middlesex, and as alderman he took an active part in the struggle between the corporation and the House of Commons by which freedom of publication of the parliamentary debates was obtained. His admirers endeavored in 1772 to procure his election as lord mayor of London, but he was set aside by the aldermen, some of whom were allied with the ministry of Lord North, while others, as Oliver and Townshend, leaned to the Liberalism of Lord Shelburne. In 1774, however, he obtained that dignity, and he retained his seat for Middlesex from the dissolution in 1774 until 1790. He moved in 1776 for leave to bring in a bill "for a just and equal representation of the people of England in parliament"; but attempts at parliamentary reform were premature by at least half a century. After several failures better fortune attended his efforts in another direction, for in 1782 all the declarations and orders against him for his election in Middlesex were ordered to be expunged from the journals of the House. In 1779 Wilkes was elected chamberlain of the city by a large majority, and the office became his freehold for life. He died at his house in Grosvenor Square, London, on 20th[1] December, 1797.

---

[1] [It is northwest of this bay, of which the outlet is 3 miles wide.—AM. ED.]

Wilkes printed editions of Catullus and Theophrastus, and at the time of his death had made considerable progress with a translation of Anacreon. His conversation was often sullied by obscenity and profanity; but he knew how to suit his conversation to his company, and his well-known assertion that, ugly as he was, with the start of a quarter of an hour he could get the better of any man, however good-looking, in the graces of any lady, shows his confidence in his powers of fascination. The king was obliged to own that he had never met so well-bred a lord mayor, and Dr. Johnson, who made his acquaintance at the house of Dilly, the bookseller in the Poultry, confessed that "Jack has great variety of talk, Jack is a scholar, and Jack has the manners of a gentleman." It is doubtful how far he himself believed in the justice of the principles which he espoused. To George III. he remarked of his devoted friend and legal adviser, Serjeant Glynn, "Ah sir! he was a Wilkite, which I never was." His writings were marked by great power of sarcasm. Two collections of his letters were published, one of *Letters to his Daughter*, in four volumes in 1804, the other *Correspondence with his Friends*, in five volumes in 1805. A *Life* by Fitzgerald has quite recently been published. (W. P. C.)

WILKESBARRE, a city of the United States, the county seat of Luzerne county, Pennsylvania, is situated on the left bank of the north branch of the Susquehanna river, in the Wyoming valley, 98 miles north-northwest from Philadelphia. The business portion lies in the bottom lands, while the residence portions have extended into the adjacent hilly country. It is entered by four railways,—the Central of New Jersey, that of the Delaware and Hudson Canal Company, the Lehigh Valley, and the Pennsylvania. The city is irregularly laid out. The population in 1880 was 23,339; in 1870 it was 10,174. Wilkesbarre is an anthracite mining district, and its industries all relate more or less directly to this product. It is a centre for the distribution of mining supplies of all kinds and for the shipment of coal.

After several attempts, which were rendered futile by Indian hostilities, a settlement was finally effected upon the site of Wilkesbarre in 1770. Eight years later the whole region was depopulated by the Wyoming massacre, and the infant town, with many others, was sacked and burned. In the same year a fort was erected upon the site of the ruined village, around which the town was rebuilt. Up to 1855 its growth was very slow and uncertain. The discovery of means of using the anthracite coal, which is found in abundance in the neighborhood, gave an immense impetus to the growth and prosperity of the city.

WILKIE, SIR DAVID (1785–1841), Scottish subject-painter, was born on 18th November, 1785, the son of the parish minister of Cults in Fifeshire. He very early developed an extraordinary love for art: he was accustomed to say that he could draw before he could read and paint before he could spell, and at school he used to barter his sketches and portraits for slate-pencils and marbles. He was also noted for his keen and constant observation of the village life around him; and a friend has recorded that he "liked better to stand and look at his companions at their games than to join in their play." In 1799, after he had attended school at Pitlessie, Kettle, and Cupar, his father reluctantly yielded to his desire to become a painter; and through the influence of the earl of Leven Wilkie was admitted to the Trustees' Academy in Edinburgh, and began the study of art under John Graham, the able teacher of the school. From William Allan (afterwards Sir William Allan and president of the Royal Scottish Academy) and John Burnet, the engraver of Wilkie's works, we have an interesting account of his early studies, of his indomitable perseverance and power of close application, of his habit of haunting fairs and market-places, and transferring to his sketch-book all that struck him as characteristic and telling in figure or incident, and of his admiration for the works of Carse and David Allan, two Scottish painters of scenes from humble life. Among his pictures of this period are mentioned a subject from Macbeth, Ceres in search of Proserpine, and Diana and Calisto, which in 1803 gained a premium of ten guineas at the Trustees' Academy, while his pencil portraits of himself and his mother, dated that year, and now in the possession of the duke of Buccleuch, prove that he had already attained considerable certainty of touch and power of rendering character. A scene from Allan Ramsay, and a sketch from Macneill's ballad of *Scotland's Skaith*, afterwards developed into the well-known Village Politicians, were the first subjects in which his true artistic individuality began to assert itself.

In 1804 Wilkie returned to Cults, established himself in the manse, and commenced his first important subject-picture, Pitlessie Fair, which includes about 140 figures, and in which he introduced portraits of his neighbors and of several members of his family circle. This work, which was purchased by Kinnear of Kinloch for £25 [$121.50], is rather hot and unpleasant in tone and coloring; but it is a picture of the greatest interest and promise, so full of incident and character as to justify its painter's remark, when he saw it twelve years afterwards, that it contains

---

[1] [Fitzgerald's *Life* (London, 1888, p. 298) says he "expired on Christmas day."—AM. ED.]

"more subject and entertainment than any other three pictures which I have since produced." In addition to this elaborate figure-piece, Wilkie was much employed at the time upon portraits both at home and in Kinghorn, St. Andrews, and Aberdeen.

In the spring of 1805 he left Scotland for London, carrying with him his Bounty-Money, or the Village Recruit, which he soon disposed of for £6 [$29.16], and began to study in the schools of the Royal Academy. One of his first patrons in London was Stodart, a pianoforte maker, a distant connection of the Wilkie family, who commissioned his portrait and other works and introduced the young artist to the dowager countess of Mansfield. This lady's son was the purchaser of the Village Politicians, which attracted great attention when it was exhibited in the Royal Adademy of 1806, where it was followed in the succeeding year by the Blind Fiddler, a commission from the painter's lifelong friend Sir George Beaumont. Wilkie now turned aside into the paths of historical art, and painted his Alfred in the Neatherd's Cottage, for the gallery illustrative of English history which was being formed by Alexander Davison. The picture was executed with the most conscientious care, and subjected to many alterations, but in the end it proved far from a success. It bears no vivid impress of reality; the figure of the king is wanting in dignity and character; indeed the subject was one for which the artist had no essential sympathy, and into which he was unable to project his imagination effectively. After its completion he wisely returned to genre-painting, producing the Card-players and the admirable picture of the Rent Day, which was composed during recovery from a fever contracted in 1807 while on a visit to his native village. His next great work was the Ale-House Door, afterwards entitled the Village Festival (now in the National Gallery), which was purchased by J. J. Angerstein for 800 guineas [$4082.40]. It has been styled by Leslie "the most artificial of Wilkie's earlier productions." Its figures seem rather small for the extent of canvas; but the separate groups are excellent, and in its handling, in the exquisite delicacy and refinement of touch, and in the variety and beauty of its broken tints it bears marks of the most distinct progress. It was followed in 1813 by the well-known Blind Man's Buff, a commission from the prince regent, to which a companion picture, the Penny Wedding, was added in 1818.

Meanwhile Wilkie's eminent success in art had been rewarded by professional honors. In November, 1809, he was elected an associate of the Royal Academy, when he had hardly attained the age prescribed by its laws, and in February, 1811, he became a full academician. In 1812 he opened an exhibition of his collected works in Pall Mall, but the experiment was unsuccessful, entailing pecuniary loss upon the artist. In 1814 he executed the Letter of Introduction, one of the most delicately finished and perfect of his cabinet pictures. In the same year he made his first visit to the Continent, and at Paris entered upon a profitable and delighted study of the works of art collected in the Louvre. Interesting particulars of the time are preserved in his own matter-of-fact diary, and in the more sprightly and flowing pages of the journal of Haydon, his fellow-traveller. On his return he began Distraining for Rent, one of the most popular and dramatic of his works. In 1816 he made a tour through Holland and Belgium in company with Raimbach, the engraver of many of his paintings. The Sir Walter Scott and his Family, a cabinet-sized picture with small full-length figures in the dress of Scottish peasants, was the result of a visit to Abbotsford in 1818. Reading a Will, a commission from the king of Bavaria, now in the New Pinakothek at Munich, was completed in 1820; and two years later the great picture of Chelsea Pensioners Reading the Gazette of the Battle of Waterloo, commissioned by the duke of Wellington in 1816, at a cost of 1200 guineas [$6123.60], was exhibited at the Royal Academy. The subject was a particularly happy one, and was carried out with the greatest fulness of incident and variety of character; it appealed powerfully to the popular sentiment of the time, while the accomplished and masterly technique of the work won the admiration of the artistic portion of the public.

In 1822 Wilkie visited Edinburgh, in order to select from the royal progress of George IV. a fitting subject for a picture. The Reception of the King at the Entrance of Holyrood Palace was the incident ultimately chosen; and in the following year, when the artist, upon the death of Raeburn, had been appointed royal limner for Scotland, he received sittings from the monarch, and began to work diligently upon the subject. But several years elapsed before its completion; for, like all such ceremonial works, it proved a harassing commission, uncongenial to the painter while in progress and unsatisfactory when finished. His health suffered from the strain to which he was subjected, and his condition was aggravated by heavy domestic trials and responsibilities. In 1825 he sought relief in foreign travel: after visiting Paris, he passed into Italy, where, at Rome, he received the news of fresh disasters through the failure of his publishers. A residence at Töplitz and Carlsbad was tried in 1826, with little good result, and then Wilkie returned to Italy, to Venice and Florence. The summer of 1837 was spent in Geneva, where he had sufficiently recovered to paint his Princess Doria Washing the Pilgrims' Feet, a work which, like several small pictures executed at Rome, was strongly influenced by the Italian art by which the painter had been surrounded. In October he passed into Spain, whence he returned to England in June, 1828.

It is impossible to over-estimate the influence upon Wilkie's art of these three years of foreign travel. It amounts to nothing short of a complete change of style. Up to the period of his leaving England he had been mainly influenced by the Dutch genre-painters, whose technique he had carefully studied, whose works he frequently kept beside him in his studio for reference as he painted, and whose method he applied to the rendering of those scenes of English and Scottish life of which he was so close and faithful an observer. Teniers, in particular, appears to have been his chief master; and in his earlier productions we find the sharp, precise, spirited touch, the rather subdued coloring, and the clear, silvery gray tone which distinguish this master; while in his subjects of a slightly later period,—those, such as the Chelsea Pensioners, the Highland Whiskey Still, and the Rabbit on the Wall, executed in what Burnet styles his second manner, which, however, may be regarded as only the development and maturity of his first,—he begins to unite to the qualities of Teniers that greater richness and fulness of effect which are characteristic of Ostade. But now he experienced the spell of the Italian masters, and of Velazquez and the great Spaniards. His change of feeling is accurately marked in an entry in his journal during his last visit to The Hague. "One feels wearied," he writes, "with the perfections of the minor Dutch paintings, and finds relief in contemplating even the imperfect sketches and incomplete thoughts of those great Italians. My friend Woodburn used to say when we were in Italy that 'all collectors begin with Dutch pictures but end with Italian.'"

In the works which Wilkie produced in his final period he exchanged the detailed handling, the delicate finish, and the reticent hues of his earlier works for a style distinguished by breadth of touch, largeness of effect, richness of tone, and full force of melting and powerful color. His subjects, too, were no longer the homely things of the genre-painter: with his broader method he attempted the portrayal of scenes from history, suggested for the most part by the associations of his foreign travel. His change of style and change of subject were severely criticised at the time; to some extent he lost his hold upon the public, who regretted the familiar subjects and the interest and pathos of his earlier productions, and were less ready to follow him into the historic scenes towards which this final phase of his art sought to lead them. The popular verdict had in it a basis of truth: Wilkie was indeed greatest as a genre-painter. He possessed the keenest instinct for the portrayal of what was around him, the truest insight for the effective selections, the artistic and telling combination, of the things that met his every-day sight, and were dear to him through life-long nearness; but he was destitute of that higher and more recondite kind of imagination which "bodies forth the form of things unseen," and gives life and reality to its re-creations of the past. It is, however, undoubtedly true that on technical grounds his change of style was criticised with undue severity. While his later works are admittedly more frequently faulty in form and draughtsmanship than those of his earlier period, some of them at least (the Bride's Toilet, 1837, for instance) show a true gain and development in power of handling, and in mastery over complex and forcible color harmonies. Most of Wilkie's foreign subjects,—the Pifferari, Princess Doria, the Maid of Saragossa, the Spanish Podado, a Guerilla Council of War, the Guerilla Taking Leave of his Family, and the Guerilla's Return to his Family,—passed into the English royal collection; but the dramatic Two Spanish Monks of Toledo, also entitled the Confessor Confessing, became the property of the marquis of Lansdowne. On his return to England Wilkie completed the Reception of the King at the Entrance of Holyrood Palace,—a curious example of a union of his earlier and later styles, a "mixture" which was very justly pronounced by Haydon to be "like oil and water." His Preaching of John Knox before the Lords of the Congregation had also been begun before he left for abroad; but it was painted throughout in the later style, and consequently presents a more satisfactory unity and harmony of treatment and handling. It was one of the most successful pictures of the artist's later period.

In the beginning of 1830 Sir Thomas Lawrence died, and Wilkie was appointed to succeed him as painter in ordinary to the king, and in 1836 he received the honor of knighthood. The main figure-pictures which occupied him until the end were Columbus in the Convent at La Rabida, 1835; Napoleon and Pius VII. at Fontainebleau, 1836; Sir David Baird Discovering the Body of Tippoo Sahib, 1838; the Empress Josephine and the Fortune-Teller, 1838; and Queen Victoria Presiding at her First Council, 1838. His time was also much occupied with portraiture, many of his works of this class being royal commissions. His portraits are pictorial and excellent in general distribution, but the faces are frequently wanting in drawing and character. He seldom succeeded in showing his sitters at their best, and his female portraits, in particular, rarely gave satisfaction. A favorable example of his cabinet-sized portraits is that of Sir Robert Liston; his likeness of W. Esdaile is an admirable three quarter length; and one of his finest full-lengths is the gallery portrait of Lord Kellie, now in the town-hall of Cupar.

In the autumn of 1840 Wilkie resolved on a voyage to the East. In a letter to Sir Robert Peel he states that his object was "to judge, not whether I can, but whether those that are younger, or with far higher attainments and powers, may not in future be required, in the advance and spread of our knowledge, to refer at once to the localities of Scripture events, when the great work is to be essayed of representing Scripture history,"—a sentence which foreshadows the new direction and aims of Mr. Holman Hunt and other modern realists. Passing through Holland and Germany, he reached Constantinople, where, while detained by the war in Syria, he painted a portrait of the young sultan. He then sailed for Smyrna and travelled to Jerusalem, where he remained for some five busy weeks. The last work of all upon which he was engaged was a portrait of Mehemet Ali, done at Alexandria. On his return voyage he suffered from an attack of illness at Malta, and died at sea off Gibraltar on the morning of 1st June, 1841. His body was consigned to the deep in the Bay of Gibraltar.

An elaborate *Life of Sir David Wilkie*, by Allan Cunningham, containing the painter's journals and his observant and well-considered "Critical Remarks on Works of Art," was published in 1843. Redgrave's *Century of Painters of the English School* and John Burnet's *Practical Essays on the Fine Arts* may also be referred to for a critical estimate of his works. A list of the exceptionally numerous and excellent engravings from his pictures will be found in the *Art Union Journal* for January, 1840. Apart from his skill as a painter Wilkie was an admirable etcher. The best of his plates, such as the Gentleman at his Desk (Laing, VII.), the Pope examining a Censer (Laing, VIII.), and the Seat of Hands (Laing, IV.), are worthy to rank with the work of the greatest figure etchers. During his lifetime he issued a portfolio of seven plates, and in 1875 Dr. David Laing catalogued and published the complete series of his etchings and dry-points, supplying the place of a few copper-plates that had been lost by reproductions, in his *Etchings of David Wilkie and Andrew Geddes*. (J. M. G.)

WILL, or TESTAMENT, is an instrument by which a person regulates the rights of others over his property or family after his death. For the devolution of property not disposed of by will, see INHERITANCE, INTESTACY. In strictness "will" is a general term, whilst "testament" applies only to dispositions of personalty; but this distinction is seldom observed. The conception of freedom of disposition by will, familiar as it is in modern England, is by no means universal. In fact, complete freedom is the exception rather than the rule. Legal systems which are based upon Roman law, such as those of Scotland and France, allow the whole property to be alienated only where the deceased leaves no widow or near relatives. In France this restriction has met with condemnation from eminent legal and economical authorities. M. Troplong, for instance, holds that "un peuple n'est pas libre, s'il n'a pas le droit de tester, et la liberté du testament est la plus grande preuve de la liberté civile."[1]

Roman law.

History.—The will, if not purely Roman in origin, at least owes to Roman law its complete development,—a development which in most European countries was greatly aided at a later period by ecclesiastics versed in Roman law. In India, according to the better opinion, it was unknown before the English conquest; in the Mosaic law and in ancient Athens the will, if it existed at all, was of a very rudimentary character. The same is the case with the *Leges Barbarorum*, where they are unaffected by Roman law. The will is, on the other hand, recognized by Rabbinical and Mohammedan law. The early Roman will, as Sir H. Maine shows,[2] differed from the modern will in most important respects. It was at first effectual during the lifetime of the person who made it; it was made in public; and it was irrevocable. Its original object, like that of adoption, was to secure the perpetuation of the family. This was done by securing the due vesting of the *hereditas* in a person who could be relied upon to keep up the family rites. There is much probability in the conjecture that a will was only allowed to be made when the testator had no *gentiles* discoverable, or when the *gentiles* had waved their rights. It is certain from the text of Gaius[3] that the earliest forms of will were those made in the *comitia calata*, and those made *in procinctu*, or on the eve of battle. The former were published before the *comitia*, as representative of the patrician *gentes*, and were originally a legislative act.

[1] *Traité des donations entre-vifs et des testaments* (1855), preface.
[2] *Ancient Law*, chap. vi.
[3] ii. 101.

These wills were the peculiar privilege of patricians. At a later time grew up a form of plebeian will (*testamentum per æs et libram*), and the law of succession under testament was further modified by the influence of the prætor, especially in the direction of recognition of *fideicommissa* (see TRUST). *Codicilli*, or informal wills, also came into use, and were sufficient for almost every purpose but the appointment of an heir. In the time of Justinian a will founded partly on the *jus civile*, partly on the edict of the prætor, partly on imperial constitutions and so called *testamentum tripartitum*, was generally in use. The main points essential to its validity were that the testator should possess testamentary capacity, and that the will should be signed or acknowledged by the testator in the presence of seven witnesses, or published orally in open court. The witnesses must be *idonei*, or free from legal disability. For instance, women and slaves were not good witnesses. The whole property of the testator could not be alienated. The rights of heirs and descendants were protected by enactments which secured to them a legal minimum. The age at which testamentary capacity began was fourteen in the case of males, twelve in the case of females. Up to 439 A.D. a will must have been in Latin; after that date Greek was allowed. Certain persons, especially soldiers, were privileged from observing the ordinary forms. The liability of the heir to the debts of the testator varied at different periods. At first it was practically unlimited. Then the law was gradually modified in his favor, until in the time of Justinian the heir who duly made an inventory of the property of the deceased was liable only to the amount of the property to which he had succeeded. This limitation of liability is generally termed by the civilians *beneficium inventarii*. Closely connected with the will was the *donatio mortis causa*, the rules of which have been as a whole adopted in England (see below). An immense space in the *Corpus Juris* is occupied with testamentary law. The whole of part v. of the *Digest* (books xxviii.–xxxvi.) deals with the subject, and so do a large number of constitutions in the *Code* and *Novels*.[1]

The effect of Christianity upon the will was very marked. For instance, the duty of bequeathing to the church was inculcated as early as Constantine, and heretics and monks were placed under a disability to make a will or take gifts left by will. A will was often deposited in a church. The canon law follows the Roman law with a still greater leaning to the advantage of the church. No church property could be bequeathed. Manifest usurers were added to the list of those under disability. For the validity of a will it was generally necessary that it should be made in the presence of a priest and two witnesses, unless where it was made *in pias causas*. The witnesses, as in Roman law, must be *idonei*. Gifts to the church were not subject to the deductions in favor of the heir and the children necessary in ordinary cases.[2] In England the church succeeded in holding in its own hands for centuries jurisdiction in testamentary matters.

Roman and English law contrasted.

The Roman law of wills has had considerable effect upon English law. In the words of Sir H. Maine, "The English law of testamentary succession to personalty has become a modified form of the dispensation under which the inheritances of Roman citizens were administered."[3] At the same time there are some broad and striking differences which should be borne in mind. The following among others may be noticed. (1) A Roman testator could not, unless a soldier, die partly testate and partly intestate. The will must stand or fall as a whole. This is not the case in England. (2) There is no one in English law to whom the *universitas juris* of the testator descends as it did to the Roman *heres*, whose appointment was essential to the validity of a formal will, and who partook of the nature of the English heir, executor, administrator, devisee, and legatee. (3) The disabilities of testators differed in the two systems. The disability of a slave or a heretic is peculiar to Roman law, of a youth between fourteen and twenty-one to English law. (4) The whole property may be disposed of in England; but it was not so at Rome, where, except by the wills of soldiers, children could not be disinherited unless for specified acts of misconduct. During the greater part of the period of Roman law the heir must also have had his fourth in order to induce him to accept the inheritance. (5) In English law all wills must conform to certain statutory requirements; the Romans recognized from the time of Augustus an informal will called *codicilli*. The English codicil has little in common with this but the name. It is not an informal will, but an addition to a will, read as a part of it, and needing the same formalities of execution. (6) There is a striking difference, unknown to Roman law, between wills of realty and wills of personalty. Probate is necessary for the latter but not for the former. The Roman *legatum* applied to both movables and immovables; in England a legacy or bequest is a gift of personalty only, a gift of real estate being called a devise.[4] (7) The Roman will spoke from the time of making; the English speaks from the time of death. This difference becomes very important in case of alteration in the position of the testator between the making of the will and his death. As a rule the Roman will could not, the English can, pass after-acquired property.

Liberty of alienation by will is found at an early period in England. To judge from the words of a law of Canute, intestacy appears to have been the exception at that time.[5] How far the liberty extended is uncertain: it is the opinion of some authorities that complete disposition of land and goods was allowed, of others that limited rights of wife and children were recognized. However this may be, after the Conquest a distinction, the result of feudalism, to use a convenient if inaccurate term, arose between real and personal property. It will be convenient to treat the history of the two kinds of will separately.

Real estate in England.

It became the law after the Conquest, according to Sir E. Coke,[6] that no estate greater than for a term of years could be disposed of by will, unless in Kent, where the custom of GAVELKIND (*q.v.*) prevailed, and in some manors and boroughs (especially the City of London), where the pre-Conquest law was preserved by special indulgence. The reason why devise of land was not acknowledged by law was, no doubt, partly to discourage death-bed gifts in mortmain, partly because the testator could not give the devisee that SEISIN (*q.v.*) which was the principal element in a feudal conveyance. By means of the doctrine of uses, however, the devise of land was secured by a circuitous method, generally by conveyance to feoffees to uses in the lifetime of the feoffer to such uses as he should appoint by his will (see TRUST).[7] On the passing of the Statute of Uses lands again became non-devisable, with a saving in the statute for the validity of wills made before the 1st of May, 1536. The inconvenience of this state of things soon began to be felt, and was probably aggravated by the large amount of land thrown into the market after the dissolution of the monasteries. As a remedy the Act of 32 Hen. VIII. c. 1 was passed in 1540, and was afterwards explained by 34 and 35 Hen. VIII. c. 5. The effect of these Acts was to make lands held in fee simple devisable by will in writing, to the extent of two-thirds where the tenure was by knight service, and the whole where it was in socage. Corporations were incapacitated to receive, and married women, infants, idiots, and lunatics to devise. The Act 12 Car. II. c. 24, by abolishing tenure by knight service, made all lands devisable. In the same reign the Statute of Frauds (29 Car. II. c. 3) dealt with the formalities of execution. Up to this time simple notes, even in the handwriting of another person, constituted a sufficient will, if published by the testator as such. The Statute of Frauds required *inter alia*, that all devises should be in writing, signed by the testator or by some person for him in his presence and by his direction, and should also be subscribed by three credible witnesses. The strict interpretation by the courts of the credibility of witnesses led to the passing of 26 Geo. II. c. 6, making interested witnesses sufficient for the due execution of the will, but declaring gifts to them void. The will of a man was revoked by marriage and the birth of a child, of a woman by marriage only. A will was also revoked by an alteration in circumstances, and even by a void conveyance *inter vivos* of land devised by the will made subsequently to the date of the will, which was presumed to be an attempt by the grantor to give legal effect to a change of intention. As in Roman law, a will spoke from the time of the making, so that it could not avail to pass after-acquired property without republication, which was equivalent to making a new will. Copyholds were not devisable before 1815, but were usually surrendered to the use of the will of the copyhold tenant; 55 Geo. III. c. 192 made them devisable simply. Devises of lands have gradually been made liable to the claims of creditors by a series of statutes beginning with 3 and 4 W. and M. c. 14.

---

[1] For further information as to the history of the Roman will, see ROMAN LAW, vol. xx., especially pp. 691–692, 694, 708–710, 725–726, 733–734

[2] Most of the law is contained in *Decretals*, iii. 26, "De Testamentis."

[3] *Ancient Law*, chap. vi.

[4] The distinction between bequest and devise did not always exist. For instance, the Assize of Northampton, c. 4, speaks of a device (*divisa*) of chattels.

[7] Many instances of such conveyances occur in Sir Harris Nicolas's *Testamenta Vetusta* and in *Fifty Earliest English Wills* (1387–1439), edited by Mr. F. J. Furnivall in 1882.

Personalty.

The history of wills of personalty was considerably different, but to some extent followed parallel lines. In both cases partial preceded complete power of disposition. The general opinion of the best authorities is that by the common law of England a man could only dispose of his whole personal property if he left no wife or children; if he left either wife or children he could only dispose of one-half, and one-third if he left both wife and children. The shares of wife and children were called their *pars rationabilis*. This *pars rationabilis* is expressly recognized in Magna Charta. At what period the right of disposition of the whole personalty superseded the old law is uncertain. That it did so is certain, and the places where the old rule still existed,—the province of York, Wales, and the City of London,—were regarded as exceptions. The right of bequest in these places was not assimilated to the general law until comparatively recent times by Acts passed between 1693 and 1726. A good will of personalty could be made by a male at fourteen, by a female at twelve. The formalities in the case of wills of personalty were not as numerous as in the case of wills of land. Up to 1838 a nuncupative or oral will was sufficient, subject, where the gift was of £30 [$145.80] or more, to the restrictions contained in the Statute of Frauds. The witnesses to a written will need not be "credible," and it was specially enacted by 4 and 5 Anne c. 3 that any one who could give evidence in a court of law was a good witness to a will of personalty. A will entirely in the testator's handwriting, called a holograph will, was valid without signature. At one time the executor was entitled to the residue in default of a residuary legatee. But 11 Geo. IV. and 1 Will. IV. c. 40 made him in such an event trustee for the next of kin.

Jurisdiction of courts.

Jurisdiction over wills of personalty was till 1858 in the ecclesiastical courts, probate being granted by the diocesan court[1] if the goods of the deceased lay in the same diocese, in the provincial court of Canterbury or York (the Prerogative Court) if the deceased had *bona notabilia*, that is, goods to the value of £5 [$24.30] in two dioceses. The ecclesiastical jurisdiction was of very ancient origin. It was fully established under Henry II., as it is mentioned by Glanvill. In the City of London wills were enrolled in the Court of Hustings from 1258 to 1688 after having been proved before the ordinary. Contested cases before 1858 were tried in the Prerogative Court with an appeal originally to the Court of Delegates, later to the judicial committee of the privy council. There were also a few special local jurisdictions, probably for the most part survivals of the pre-Conquest period, when wills seem to have been published in the county court. The ecclesiastical courts had no jurisdiction over wills of land, and the common law courts were careful to keep the ecclesiastical courts within their limits by means of PROHIBITION (*q.v.*). No probate of a will of land was necessary, and title to real estate by will might be made by production of the will as a document of title. This is still the law in ordinary cases; but the Act of 1857 has introduced probate of will of land as an exceptional proceeding. The liability of the executor and legatee for the debts of the testator has been gradually established by legislation. In general it is limited to the amount of the succession. Personal liability of the executor beyond this can by the Statute of Frauds only be established by contract in writing.

Existing law.

Such were the principal stages in the history of the law as it affected wills made before 1838 or proved before 1858. The principal Acts now in force are the Wills Act, 1837 (7 Will. IV. and 1 Vict. c. 26), the Court of Probate Act, 1857 (20 and 21 Vict. c. 77), and the Judicature Acts. Some of the earlier Acts are still law, though of little importance since the more modern and comprehensive enactments. The earliest on the statute roll is 20 Hen. III. c. 2, enabling a widow to bequeath the crops of her lands. Before the Wills Act uniformity in the law had been urgently recommended by the Real Property Commissioners in 1833. It appears from their report[2] that at the time of its appearance there were ten different ways in which a will might be made under different circumstances.

Making of wills.

The act of 1837 affected both the making and the interpretation of wills.[3] Excluding the latter for the present, its main provisions were these. All property, real and personal, and of whatever tenure, may be disposed of by will. If customary freeholds or copyholds be devised, the will must be entered on the court rolls. No will made by any person under the age of twenty-one is valid. Every will is to be in writing, signed at the foot or end thereof by the testator or by some person in his presence and by his direction, and such signature is to be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, who are to subscribe the will in the presence of the testator. Publication is not necessary. A will is not void on account of the incompetency of a witness. Gifts to a witness or the husband or wife of a witness are void. A creditor or executor may attest. A will is revoked (except where made in exercise of a power of appointment of a certain kind) by a later will, or by destruction with the intention of revoking, but not by presumption arising from an alteration in circumstances. Alterations in a will must be executed and attested as a will. A will speaks from the death of the testator, unless a contrary intention appear. The Act of 1857 transferred the jurisdiction, both voluntary and contentious, of all ecclesiastical, royal peculiar, peculiar, and manorial courts to the Court of Probate constituted by the Act, created a judge and registrars of that court, abolished the old exclusive rights in testamentary matters of the advocates of Doctors' Commons, and laid down rules of procedure. Contentious jurisdiction was given to county courts where the personal estate of the deceased was under £200 [$972] in value. The Judicature Act, 1873, merged the old Court of Probate in the Probate,

---

[1] The testamentary jurisdiction of the archdeacon's court is alluded to by Chaucer in the "Friar's Tale," but it was afterwards completely superseded by the bishop's court.

[2] *Fourth Report*, p 12.

[3] By sect. 1 of the Act the word "will" includes codicil.

Divorce, and Admiralty Division of the High Court of Justice. The division now consists of the president and one other judge. The practice of the division is mainly regulated by the Rules of the Supreme Court, 1883. Appeals lie to the Court of Appeal and thence to the House of Lords. Before the Judicature Act they lay directly to the House of Lords. The principal rules now obtaining as to probate are these: Probate is confined as a rule to wills of personalty or of mixed personalty and realty, and is either in common form, where no opposition to the grant is made, or in solemn form, generally after opposition, when the witnesses appear in court. The Act of 1857 introduced proof of wills of realty, in solemn form after citation of the heir-at-law and devisees. Probate may be granted either in the principal or in a district registry, and should be obtained within six months after the testator's death. Where no executor is named in a will, the will is not now invalid, as was once the case, but administration *cum testamento annexo* is granted. The same course is pursued where the executor renounces or dies intestate before administering the estate of the deceased. After probate the probate (as the official copy of the will is called) itself becomes evidence, the original will being deposited in the principal registry at Somerset House, London. On grant of probate a duty, denoted by a stamp on the probate is payable. It varies according to the amount at which the personalty is fixed by the oath of the executor. Other Acts dealing with the practice in wills and probate may be shortly stated. 15 and 16 Vict. c. 24 removed some of the difficulties which had arisen on the clause of the Wills Act that the signature was to be at the foot or end. 44 Vict. c. 12 enabled any officer of inland revenue to grant probate where the personal estate does not exceed £300 [$1458]. The main duty of an executor is to pay the debts of the deceased in a certain order of priority, to administer the estate, to pay probate and legacy duties, and in general to carry out the intention of the testator. There are numerous Acts, especially the Conveyancing Act, 1881, dealing with the rights and liabilities of executors, the general effect of which is to discharge an executor from liability for *bona fide* payment of debts, for distribution of assets after public notice to persons interested, etc. (See EXECUTORS).

Interpretation of wills.

Rules of interpretation or construction depend chiefly on decisions of the courts, to a smaller extent on statutory enactment. The law was gradually brought into its present condition through precedents extending back for centuries, especially decisions of the Court of Chancery, the court *par excellence* of construction, as distinguished from the Court of Probate. The Court of Probate did not deal unless incidentally with the meaning of the will; its jurisdiction was confined to seeing that it was duly executed. The present state of the law of interpretation is highly technical. Some phrases have obtained a conventional meaning which the testators who used them probably did not dream of. Many of the judicial doctrines which had gradually become established were altered by the Wills Act. These provisions of the Act have since that time themselves become the subject of judicial decision. Among other provisions are these, most of them to take effect only in the absence of a contrary intention. A residuary devise is to include estates comprised in lapsed and void devises. A general gift of the testator's lands is to include copyholds and leaseholds. A general gift of real or personal estate is to include real or personal estate over which the testator had a general power of appointment. A devise without words of limitation is to pass the fee simple. The words "die without issue" or similar words are to mean die without issue living at the time of the death of the person whose issue was named. Trustees under an unlimited devise are to take the fee simple. Devises of estates tail are not to lapse if the devisee, though he predeceased the testator, left issue inheritable under the entail. Gifts to children or other issue leaving issue living at the testator's death are not to lapse. Rules of interpretation founded on principles of equity independent of statute are very numerous, and for them the works devoted to the subject must be consulted. Some of the more important, stated in as general a form as possible, are these. The intention of the testator is to be observed. This rule is called by Sir E. Coke the pole star to guide the judges. There is a presumption against intestacy, against double portions, against constructing merely precatory words to import a trust, etc. One part of the will is to be expounded by another. Interlineations and alterations are presumed to have been made after, not as in deeds before, execution. Words are supposed to be used in their strict and primary sense. Many words and phrases, however, such as "money," "residue," and "issue" and other words of relationship, have become invested with a technical meaning. Evidence is admissible in certain cases to explain latent ambiguity, and parol evidence of the terms of a lost will may be given.

Invalidation of wills.

A will may be void, in whole or in part, for many reasons, which may be divided into two great classes, those arising from external circumstances and those arising from the will itself. The main examples of the former class are revocation by burning, tearing, etc., by a later will, or by marriage of the testator, incapacity of the testator from insanity, infancy, or legal disability (such as being a convict), undue influence, and fraud, any one of which is ground for the court to refuse or revoke probate of a will good on the face of it, or declare a will of lands void. Undue influence is a ground upon which frequent attempts are made to set aside wills. Its nature is well explained in a judgment of Lord Penzance's: "Pressure of whatever character, whether acting on the fears or the hopes, if so exerted as to overpower the volition without convincing the judgment, is a species of restraint under which no valid will can be made."[1] The circumstances appearing on the face of the will which make it open to objection may either avoid it altogether or create a partial intestacy, the will remaining good as a whole. Where the will is not duly executed, *e.g.*, if it is a forgery or if it is not signed by the testator or the proper number of witnesses, the will is not admitted to probate at all. Where it contains devises or bequests bad in law, as in general restraint of marriage, or tending to create perpetuities, or contrary to public policy, or to some particular enactment, only the illegal part is void. A remarkable instance is a well-known case in which a condition subsequent in a devise was held void as against public policy; being a gift over of the estate devised in case the first devisee, the eldest son of an earl, did not before his death obtain the lapsed title of duke of Bridgewater.[2]

Wills of exceptional character.

There are some wills of an exceptional kind which demand special notice. *King.*—It was resolved in parliament in the 16th Ric. II. that the king, his heirs and successors, might lawfully make their testaments.[3] In some later cases parliamentary authority has been given to royal wills, in others not. The executors of Henry IV. were confirmed in their office by letters patent of Henry V., those of Henry V. by parliament. The largest testamentary powers ever conferred on an English king were given to Henry VIII. by 25 Hen. VIII. c. 7, empowering him to limit and appoint the succession to the crown by will, in default of children by Jane Seymour or any future wife. By 39 and 40 Geo. III. c. 88 the king and his successor may devise or bequeath their private property.[4] No court, however, has jurisdiction to grant probate of the will of a king. *Guardianship.*—As a general rule wills deal with property, but even at common law a will simply appointing a guardian was good. The common law was superseded by 12 Car. II. c. 24, under which a father may dispose of the custody of his unmarried infant children by will. The Guardianship of Infants Act, 1886, extended such powers in certain cases to the mother. *Married Woman.*—At common law a married woman could not (with a few exceptions) make a will without her husband's license and consent, and this disability was specially preserved by the Wills Acts of Henry VIII. and of 1837. A common mode of avoiding this difficulty was for the husband to contract before marriage to permit the wife to make an appointment disposing of personalty to a certain value. Courts of equity from an early time allowed her, under certain restrictions, to make a will of property held for her separate use. In some cases her husband could dispose of her property by will, in others not. The law as it existed previous to 1882 is now practically obsolete, the Married Woman's Property Act of that year enabling a married woman to dispose by will of any real or personal property as her separate property as a *feme sole* without the intervention of any trustee. The act also enables a married woman who is executrix of a will to act as if she were a *feme sole*. *Alien.*—Before 1870 an alien enemy resident in England could only dispose of property by will with the king's license. The Naturalization Act, 1870, enables him to do so as fully as a natural-born British subject. *Soldier and Sailor.*—Wills of soldiers in actual military service, and of sailors, are subject to special legislation, and are excepted from the operation of the Wills Act. The privilege only applies to wills of personal estate. Wills of soldiers on an expedition may be made by unattested writing or by nuncupative testament before two witnesses. Wills of petty officers and seamen in the navy, and of marines, as far as relates to their pay or prize-money, must be attested by an officer, and wills made by a seaman in the merchant service must, if made at sea, be attested by the master or mate, if made on land by a superintendent of a mercantile marine office, a clergyman, justice of the peace, or consular or customs officer. The wills of prisoners of war are subject to special regulations, and the Admiralty may at its discretion waive the due execution of wills in other instances. The effects of seamen, marines, and soldiers, killed or dying in the service, are exempt from probate duty. Pay, wages, prize money, and pensions due to persons employed in the navy may be paid out without probate where the whole assets do not exceed £32 [$155.52]. The Board of Trade may at its discretion dispense with probate of the will of a merchant seaman whose effects do not exceed £50 [$243] in value. By an act passed in 1868 the existing exemptions are extended to the sum of £100 [$486] in the case of civil service pay or annuities, of civil or military allowances chargeable to the army votes, and of army prize money. *Will made under power.*—A will made under a power of appointment is not revoked by marriage when the real or personal estate thereby appointed would not in default of appointment pass to the testator's executor or administrator or to the next of kin. Before the Wills Act a will exercising a power of appointment had to conform to any special requisitions in the power, but since the Act the power is duly exercised if executed and attested like an ordinary will. *Registration.*—In the register counties memorials of wills affecting lands in those counties must be registered (see REGISTRATION).

Criminal law relating to wills.

At common law there could be no larceny of a will of lands. But now by the Larceny Act of 1861 stealing, injuring, or concealing a will, whether of real or personal estate, is punishable with penal servitude for life. Forgery of a will (at one time a capital crime) renders the offender liable to the same penalty. Fraudulent concealment of a will material to the title by a vendor or mortgagor of land or chattels is by 22 and 23 Vict. c. 35 a misdemeanor punishable by fine or imprisonment or both.

Donatio mortis causa.

Connected with the subject of this article, though not falling directly under it, is the *donatio mortis causa*, depending for the most part upon rules adopted from Roman Law. Unlike a bequest under a will, such a gift passes without probate and does not need the presence of any statutory number of witnesses. It is, however, liable to legacy duty and is part of the assets of the deceased. For its validity two elements are essential: the gift must be conditional on the donor's dying from his existing illness, and therefore revocable, and there must be delivery. Money, jewels, or other chattels may be the subjects of a *donatio mortis causa;* so may negotiable instruments passing by delivery, but not cheques signed by the giver, as his authority to draw is revoked by his death. If presented before his death, the gift, being unconditional, is wanting in one of the elements of a good *donatio mortis causa.*[1]

Ireland.

Ireland.—The Act of 1837 applies to Ireland. In 1857 an Act on lines similar to the English Act was passed for Ireland, 21 and 22 Vict. c. 79. Under the Irish Judicature Act of 1877 the then existing Court of Probate was merged in the High Court of Justice.

Scotland.

Scotland.—Up to 1868 wills of immovables were not allowed in Scotland. The usual means of obtaining disposition of heritage after death was a trust disposition and settlement by deed *de præsenti*, under which the truster disponed the property to trustees according to the trusts of the settlement, reserving a life interest. Thus something very similar to a testamentary disposition was secured by means resembling those employed in England before the Wills Act of Henry VIII. The main disadvantage of the trust disposition was that it was liable to be overthrown by the heir, who could reduce *ex capite lecti* all voluntary deeds made to his prejudices with sixty days of the death of his ancestor. In 1868 the Titles to Land Consolidation Act made it competent to any owner of lands to settle the succession to the same in the event of death by testamentary or *mortis causa* deeds or writings. In 1871 reduction *ex capite lecti* was abolished by 34 and 35 Vict. c. 81. A will of immovables must be executed with the formalities of a deed and registered to give title (see REGISTRATION). The disability of a woman as a witness was removed by the Titles to Land Consolidation Act. As to wills of movables, there are several important points in which they differ from corresponding wills in England, the influence of Roman law being more marked. Males may make a will at fourteen, females at twelve. A nuncupative legacy is good to the amount of £100 Scots (£8, 6s. 8d.) [$40.50], and a holograph testament is good without witnesses, but it must be signed by the testator, differing in this from the old English holograph. By the Conveyancing Act, 1874, such a will is presumed to have been executed on the date which it bears. Not all movables can be left, as in England. The movable property of the deceased is subject to *jus relictæ*, or widow's right to half if there be no child or children, one-third if there be a child or children, and the *legitim*, or bairn's part, of half if there be no widow, one-third if there be a widow. Only the remainder is disponible as dead's part. Legitim depends upon survivance and is not transmissible on predecease of a person prospectively entitled to it. Both jus relictæ and legitim may be excluded by discharge or satisfaction, as by provision in the contract of marriage. Executor in Scotch law is a more extensive term than in English. He is either nominate or dative, the latter appointed by the court and corresponding in most respects to the English administrator. Caution is required from the latter, but not from the former. Confirmation includes both the probate and letters of administration of English procedure. Without confirmation by the court interference by the executor becomes a vitious intromission. Originally confirmation of testaments of movables fell, as in England, under the cognizance of the church courts. Such jurisdiction certainly existed at the time of *regiam majestatem.* This ecclesiastical right continued through the Commissary Court at Edinburgh (constituted by Queen Mary in 1563) and the local commissaries until modern times, when the jurisdiction of these courts was at first transferred and then abolished by a series of enactments from 4 Geo. IV. c. 97 to the Sheriff Courts Act, 1876. The Act of George IV. placed the commissary jurisdiction in the sheriff courts; by the Act of 1876 the sheriffs sit as sheriffs in testamentary matters, no longer as commissaries. Confirmation of wills where the whole estate is under £300 [$1458] (?) is regulated by 44 Vict. c. 12 and other Acts. An eik is an addition to a confirmation made on discovery of additional effects of the deceased after confirmation. By the common law doctrine of passive representation the heir or executor was liable to be sued for implement of the deceased's obligations. The Roman principle of *beneficium inventarii* was first introduced by an Act of 1695. As the law at present stands, the heir or executor is liable only to the value of the succession, except where there has been vitious intromission in movables, and in *gestio pro herede* and some other cases in heritables. The present inventory duty on succession to movables depends upon 44 Vict. c. 12. In England the executor is bound to pay the debts of the deceased in a certain order; in Scotland they all rank *pari passu*, except privileged debts.[2] (See PRIVILEGE.)

The *will of a summons* is the conclusion of a writ containing the will of the sovereign or judge, charging the executive officer to cite the party whose attendance is required. It is regulated by several Acts, *e.g.*, 1 and 2 Vict. c. 114, 31 and 32 Vict. c. 100. (See SUMMONS, WARRANT, WRIT.)

United States.

United States.—By the constitutions of many States laws giving effect to informal or invalid wills are forbidden. The age of testamentary capacity varies very much. Eighteen is a common one. Full liberty of disposition is not universal. Homesteads generally, and dower estates frequently, are not devisable. In some States only a disposable portion of the property can be left, so that children cannot be disinherited without good cause, and in some children omitted in a will may still take their share. It is frequently provided that a certain amount must be left to the widow. Louisiana follows French law, by which the testator can under no circumstances alienate by will more than half his property if he leave issue or ascendants. In some States a married woman may not leave more than half her property away from her husband. Some require the husband's consent and subscription to make the will of a married woman valid. Nuncupative and holograph wills are in use. The former are confined to personalty and must generally be reduced to writing within a short time after the words are spoken. In Louisiana there is a special form of will, borrowed from Roman law, called the mystic or sealed will, in which the testator declares a sealed packet to be his will before witnesses. The number of witnesses necessary for the validity of a will of any kind is usually two, sometimes three. Wills of soldiers and sailors are privileged, as in England. Probate is granted sometimes by the ordinary chancery or common law courts, more frequently by courts of special jurisdiction, such as the Prerogative Court in New Jersey, the Surrogate's Court in New York.[1]

---

[1] The principal authorities for the English law are, for the formalities, Williams, *Executors;* for the construction, the works of Sir James Wigram and of Messrs. Jarman, F. V. Hawkins, and Theobald. Precedents will be found in Hayes's and Jarman's *Concise Forms of Wills* and in ordinary collections of precedents in conveyancing.

[2] See McLaren, *Wills and Succession.* Styles of wills will be found both in that work and in *Juridical Styles.*

International law.

International Law.—There are three main directions which the opinion of jurists and the practice of courts have taken. (1) The whole property of the testator may be subjected to the law of his domicil. To this effect is the opinion of Savigny and the German practice. (2) The property may be subjected to the law of the place where it happens to be at the time of the testator's death. (3) The movable property may be subjected to the law of the domicil, the immovable to the law of the place where it is situate, the *lex loci rei sitæ*. England and the United States follow this rule. Testamentary capacity is generally governed by the law of the testator's domicil, the form of the instrument in most countries either by the law of his domicil or the law of the place where the will was made, at his option. The old rule of English law was to allow the former alternative only. The law was altered for the United Kingdom in 1861 by Lord Kingsdown's Act (24 and 25 Vict. c. 114), by which a will made out of the United Kingdom by a British subject is, as far as regards personal estate, good if made according to the forms required by the law of the place where it was made, or by the law of the testator's domicil at the time of making it, or by the law of the place of his domicil of origin. Subsequent change of domicil does not avoid such a will. Another Act passed on the same day (24 and 25 Vict. c. 121) enacted that by convention with any foreign Government foreign domicil could not be acquired by a testator without a year's residence and a written declaration of intention to become domiciled. In the United States some States have adopted the narrow policy of enacting by statute the old common law rule, and providing that no will is valid unless made in the form required by the law of the State of the testator's domicil. The construction of a will is governed by the law of the domicil of the testator, as he must be supposed to have used language in consonance with that law, unless indeed he express himself in technical language of another country. The persons who are to take under a will are decided by different rules according as the property is movable or immovable, the former being governed by the law of the domicil, the latter by the *lex loci rei sitæ*. It was held recently by the Court of Appeal in England that, under the will of an Englishman domiciled in Holland, leaving personal property to children, children legitimated *per subsequens matrimonium* could take, as they were legitimate by the law of Holland, though not by the law of England.[2] Such children could not, however, have succeeded simply under that designation to real property in England devised by the will. A will duly executed abroad is generally required to be clothed with the authority of a court of the country where any property affected by the will is situate. As far as regards the different kingdoms composing the United Kingdom, 21 and 22 Vict. c. 56 enables an English or Irish probate, or a Scotch confirmation, to be sealed as of course in the proper court of one of the other kingdoms. (J. W†.)

WILLENHALL, a township of Staffordshire, England, in the parish of Wolverhampton, is situated on a branch of the Birmingham Canal and on the Midland and the London and Northwestern Railways, 3 miles east of Wolverhampton, 12 northwest of Birmingham, and 124 northwest of London. The township includes seven hamlets. The church of St. Giles, originally erected in 1350, was rebuilt in 1867 in the Decorated style. There are three other churches in connection with the Established Church, all of modern origin, and a Roman Catholic Church. Willenhall possesses a literary institute, a free library, and a higher grade board school, erected in 1883. The waterworks became in 1868 the property of the Wolverhampton corporation. Willenhall is situated in the neighborhood of extensive coal and iron mines, and possesses brass and iron foundries, and manufactories of various kinds of ironware, including door locks and padlocks, ironmongery for doors and gates, ferules, files, gridirons, steel traps, screws, and currycombs. There are also varnishing works and maltings. The population of the urban sanitary district (area 1368 acres) was 15,902 in 1871 and 16,067 in 1881.

The village began to be of importance in the reign of Elizabeth, when the coal and iron were first wrought.

WILLESDEN, a suburb and parish of London, about 4 miles northwest from Hyde Park Corner, is situated on a number of railway lines affording very convenient access to the City. It consists of a number of houses grouped round the parish church of St. Mary, Queenstown, a district inhabited chiefly by the working classes; Willesden Green and the outlying hamlets of Brondesbury, Harlesden, Neasdon, Dollis Hill, Stroud Green, and Stonebridge Park are now largely occupied by villas. The church of St. Mary, dating probably from the early part of the 14th century, contains some remains of Early English, with a Perpendicular chancel and tower. It was enlarged in 1851, and again in 1872. At Queenstown there are a workingmen's institute, a workmen's hall, and a Good Templars' orphanage. In Willesden Lane there is a Jewish cemetery. The population of the urban sanitary district (area 4383 acres) was 15,869 in 1871 and 27,453 in 1881.

At Domesday the manor of Willesden and Harlesden was held by the canons of St. Paul's. In the 12th century it was formed into eight distinct manors, seven of which are held by the same number of prebendaries. The district is associated with the exploits of Jack Sheppard.

WILLIAM I. (1027 or 1028–1087), king of England, surnamed the CONQUEROR, was born in 1027 or 1028. He was the bastard son of Robert, duke of Normandy, and Herleva, daughter of Fulbert, a tanner of Falaise. When he was about seven years old his father, intending to go on pilgrimage and having no legitimate sons, proposed him as his heir. The great men of the duchy did homage to the child, and a year later (1035) his father's death left him to make good his claim. Anarchy was the natural result of a minority. William's life was on more than one occasion in danger and several of his guardians perished in his service. At the earliest possible age he received knighthood from the hands of Henry I. of France, and speedily began to show signs of his capacity for government. In 1042 he insisted that the "truce of God" should be proclaimed and observed in Normandy. When he was about twenty years old, his authority was threatened by a general conspiracy, which spread through the western half of his duchy. An attempt was made to seize him at Valognes, and he only escaped by riding hard all night to his own castle at Falaise. Bessin and Cotentin, the most Norman parts of Normandy, rose in rebellion. William sought and obtained aid from King Henry, and completely defeated the rebels at Val-es-Dunes near Caen (1047). The battle was but a combat of horse, but it decided the fate of the war and left William master of his duchy. The debt which he owed to Henry was repaid next year. War broke out between Goeffrey, count of Anjou, and Henry (1048), and William came to his suzerain's assistance. Alençon, one of the chief border fortresses between Normandy and Maine, which had received an Angevin garrison, was captured by the duke. The inhabitants had taunted him with his birth, and William, who had dealt leniently with the rebels after Val-es-Dunes, took a cruel revenge. Soon afterwards Domfront, another important border fortress, fell into his hands.

In 1051 William visited England (see vol. viii. p. 260). Two years later he married Matilda, daughter of Baldwin, earl of Flanders, and a descendant of Alfred. The marriage had been forbidden by a council at Rheims as uncanonical, and was opposed by Lanfranc, prior of Bec. This produced a quarrel between Lanfranc and William, who ravaged the lands of the abbey and ordered the banishment of its prior. Lanfranc, however, soon came to terms with the duke, and engaged to obtain a dispensation from Rome, which, however, was not granted till 1059. Strengthened by this alliance with Flanders, William showed himself more than a match for all his enemies. Henry, who had hitherto been for the most part friendly, now turned against him. After the suppression of some isolated revolts, William was threatened in 1054 by a great confederacy. His dominions were invaded by the forces of the French king, in combination with those of Geoffrey of Anjou, Theobald of Blois, and others. William remained at first on the defensive; then, falling suddenly on one of the French armies at Mortemer, in the northeastern corner of his duchy, he cut it to pieces. This blow put an end to the war; Henry made peace (1055) and William took the opportunity of extending his dominions in a southerly direction. He built fresh fortresses and exacted homage from Count Geoffrey of Mayenne. In 1058 Henry and Count Geoffrey made a final effort to crush their dangerous neighbor; but the effort failed, like those which preceded it. William again allowed the allies to enter and ravage his territory; but, while the French army was crossing the Dive at Varaville, he attacked and completely destroyed their rear-guard, which was cut off from the van by the advancing tide. Henry again made peace, and soon afterwards died (1060). The death of Geoffrey of Anjou in the same year relieved William of his most formidable rival for the possession of Maine. Herbert Wake-Dog, the lawful ruler of that territory, who had been dispossessed by Geoffrey, recovered his dominions on the latter's death. He at once "commended" himself to William, thus making the duke his heir. On his death in 1063 William took possession of Le Mans and the county of which it was the capital,—an acquisition which extended his southern frontier nearly to the Loire, almost severed Brittany from the rest of France, and paved the way for the subsequent junction with Anjou.

[2] "*Re* Goodman's Trusts," *Law Rep.*, 17 Chancery Div., 266.

It was apparently soon after this event, in the year 1064, that Harold, then earl of Wessex, visited Normandy. For the relations between him and William which grew out of this visit see ENGLAND, vol. viii. pp. 261–2. When Harold was elected and crowned king of England (1066), William's first step was to send an embassy to him demanding the fulfilment of his promise. The purport of the demand is as uncertain as that of the pledge; but, whatever it was, Harold rejected it. The duke thereupon summoned a council of his supporters, who advised him to call together an assembly representing the whole duchy. The assembly, a typical feudal parliament, met at Lillebonne. While acting together it appears to have opposed the scheme for the conquest of England which William laid before it, but its members were won over singly. He then made a compact with Tostig, the banished brother of Harold; he came to terms with the emperor Henry; he conciliated Philip, king of France, by offering to hold England as his vassal; and—most important of all—he obtained the sanction of Rome. Pope Alexander II. not only issued a bull declaring William to be the rightful heir to the throne, but sent him a ring and a banner as symbols that the blessing of heaven was on his claim. Embarking at St. Valéry, William landed on 28th September at Pevensey. The battle of Senlac or Hastings (14th October, 1066) was a decisive victory for the duke of Normandy; but it took five years more to complete the conquest of England.

Early in 1067 William made a progress through the eastern and central parts of his new dominions. All that had as yet submitted to him was comprised in the old kingdoms of Wessex and East Anglia, and a small portion of Mercia. He at once secured his hold over these districts by the erection of fortresses in London, Norwich, and elsewhere. He received homage from the great men; he confiscated the lands of those who had resisted him; and, while keeping a large number of manors for himself, he granted others to his followers. Even those who had not resisted were regarded as having legally forfeited their title and had to submit to a re-grant on less advantageous terms. In March, 1067, William returned to Normandy, taking with him as hostages the earls Eadwine, Morkere, and Waltheof. The revolts which broke out in the north and southwest compelled him to return to England in December. Early in 1068 he marched on Exeter, as the centre of the western revolt. He took the town and built a castle, after which he subdued Cornwall, and then marching northward forced Bristol to submit. In the summer of 1068 there was a general rising of the north, of which Eadgar was the nominal head; but Eadwine and Morkere were the moving spirits. The insurgents were aided by Malcolm, king of Scotland. William had, however, only to show himself in order to put down the insurrection. He journeyed northward, by way of Warwick and Nottingham, to York, received the submission of Eadwine, Morkere, and Malcolm, and returned by way of Lincoln and Cambridge. His march was accompanied by heavy confiscations, and great castles, rising in places of vantage, rendered the Norman power at once visible and secure. In the spring of 1069 a fresh revolt broke out. Robert of Comines, the newly appointed earl of Northumberland, was slain at Durham; a Danish fleet entered the Humber, and a Danish army, joined by Eadgar and Waltheof, seized and burned York. The sons of Harold attacked Devon, while other isolated outbreaks took place in the west. These were speedily put down by William's lieutenants; and in the autumn the king himself, going northward a second time, recovered York and harried Northumberland with ruthless deliberation. Returning to keep Christmas at York, he set out again in January, 1070, to oppose Malcolm, who had crossed the border in aid of the insurgents. He forced Waltheof to submit, and drove the Scottish king back into his own country; then, marching over pathless fells in the depth of winter, he reached Chester, took the town, and founded another castle. Northumbria, exhausted and ruined, gave up the struggle, and the omission of the northern counties from the Domesday survey throws a grim light on the completeness of the Conquest. In one district only, the fens of Cambridgeshire, where Hereward still held out, the spirit of resistance survived. In April, 1071, William arrived at Cambridge and commenced a regular blockade. Advancing cautiously by means of a causeway through the fens, he entered Ely in October, and therewith the last flicker of independence died out. The conquest of England was completed. To guard against any fresh incitements to rebellion from Scotland, William in 1072 invaded that country and forced Malcolm to do him homage,—an event which had an important effect on the subsequent relations of the two countries.

Henceforward such trouble as William met with came, not from the English, but from his Norman vassals or his own family. In 1073 the citizens of Le Mans took advantage of his absence to set up a "commune," and invited Fulk of Anjou to protect them. William was soon in the field, this time assisted by English troops. He harried the country, recovered Le Mans, and made an advantageous peace with the count. By a skilful compromise he recognized Fulk as overlord of Maine, but kept actual possession of the district, for which his son Robert did homage. A year later a formidable revolt broke out in England. Two of William's great vassals, Ralph, earl of Norfolk, and Roger, earl of Hereford, rebelled, and a Danish fleet, probably in alliance with them, appeared in the Humber. William returned at once to England and put down the insurrection. A great meeting of the witan was summoned to try Roger and Waltheof, for the latter, though he took no part in the rebellion, had undoubtedly been privy to it. Roger was imprisoned for life and Waltheof was condemned to death. This was the last instance of opposition to William in England; but the remaining ten years of his life were occupied with almost continuous troubles on the Continent. In 1076 he was engaged in a war with Brittany, which the interference of Philip of France forced him to bring to an unsuccessful conclusion. Next year he quarrelled with his son Robert. Matilda took the young man's side against her husband, and Philip lent him his assistance. In 1080 William was at open war with his son. While besieging him at Gerberoi he received a wound and was forced to raise the siege. A temporary reconciliation followed, soon to give way to another and a final quarrel. Three years later Matilda died, and troubles thickened upon William. A rebellious vassal, Hubert of Beaumont, seems to have held him at bay for nearly three years. Rival claims to Vexin, a district on the eastern frontier of Normandy, involved him in another war with France. He was growing old and weary, and, as he lay sick at Rouen in the summer of 1087, the French army harried his territories with impunity. When he had recovered sufficiently to take the field, he invaded Vexin and burned the town of Mantes. But his horse, plunging in the burning cinders, inflicted on him an internal injury which proved his death-wound. He was carried to St. Gervais where, on 9th September, 1087, he died. His body was conveyed to Caen and buried in the great minster which he had built.

The career of William as a warrior and conqueror occupies of necessity the largest space in his life; but his fame as a statesman and administrator is not less than that which he won on the battle-field. This is not the place to discuss the results of the Conquest, but the policy of the Conqueror in regard to church and state cannot be overlooked. An orthodox churchman, a supporter of union under the successor of Peter against the schismatic tendencies of the English Church, he nevertheless repelled any claim on the part of Rome to interference with his political sovereignty. He allowed Peter's pence to be collected, but refused to pay tribute to the pope. While recognizing him as head of the church, he declined to hold his kingdom as his vassal, nor would he permit papal bulls to enter England or excommunications to be issued against any of his subjects without his leave. He controlled all appointments to important ecclesiastical dignities; he made laws for the church; he dealt justice to ecclesiastics, high and low, in his own courts. At the same time he had no desire to humiliate the church; on the contrary, he sought to elevate it to a higher position in the state, to make it a more potent agent of civilization. A weaker statesman might have seen his own advantage in encouraging the rivalry between Canterbury and York; William strengthened the church by forcing the younger to give way to the elder see. With the same object, that of increasing the efficiency of ecclesiastical organization, he severed the temporal and spiritual jurisdictions and furthered the enforcement of clerical celibacy. Finally, the trust which he reposed in Lanfranc from the time of his appointment to the see of Canterbury in 1070 shows not only his insight into character but his respect for the head of the English Church.

In regard to temporal affairs William was rather an administrator than a lawgiver. His reign is not marked by a series of legislative acts like those of Henry II. or Edward I.; but his work was the indispensable preliminary to theirs, for a strong monarchy was the first requisite of the state. To establish the power of the crown was William's principal care. The disintegrating tendencies of feudalism had already been visible under the Anglo-Saxon kings. William, while he established fully developed feudalism as a social, territorial, and military system in his new dominions, took measures to prevent it from undermining his own authority. He scattered the estates of his great vassals, so as to hinder them from building up provincial principalities; he maintained the higher popular courts against the encroachments of manorial jurisdictions; he prevented the claims of feudal lordship from standing between himself and the mass of his subjects by exacting an oath from every landholder at the meeting on Salisbury plain; finally, by the great survey which resulted in Domesday Book he not only asserted his right to make a general inquisition into property, but laid the firm basis of knowledge which was indispensable to centralized government and taxation. The care which he took to maintain English laws and institutions is part of the same policy. He balanced the two nationalities over which he ruled, and obliged each to depend upon him as its leader or protector against the other. He ruled as an English king; his feudal council was the witenagemot with a new qualification; but at the same time he was lord of the land as no king had been before him, and he enjoyed not only all the income of his predecessors but in addition all the dues which came to him as feudal sovereign. He was thus perhaps the strongest and most absolute monarch that has ever sat upon the English throne.

In character William was stern, self-reliant, and imperious in a high degree. He was not naturally cruel; but he was ruthless if it served his purpose, and could take pitiless vengeance for an insult or a wrong. He was too strong to prefer deceit when force would serve as well, but his diplomacy was subtle and guileful, and no scruple turned him aside from his aim. His temper originally forgiving, was soured by opposition towards the end of his life, and his tyrannical tendencies were strengthened by the long exercise of uncontrolled power. His passionate devotion to the chase is only too clearly shown in the harshness of his forest laws. In private life he displayed domestic virtues, and his fidelity to his wife was exceptional in the annals of his house and time.

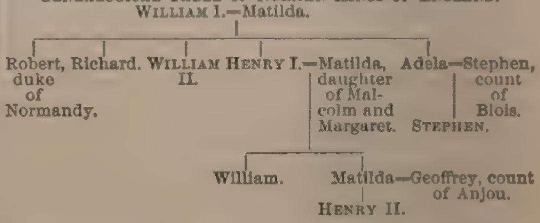
GENEALOGICAL TABLE OF NORMAN KINGS OF ENGLAND.



WILLIAM I.—Matilda.
Robert, duke of Normandy.
Richard.
WILLIAM II.
HENRY I.—Matilda, daughter of Malcolm and Margaret.
Adela—Stephen, count of Blois.
STEPHEN.
William.
Matilda—Geoffrey, count of Anjou.
HENRY II.

WILLIAM II. (1056–1100), king of England, surnamed RUFUS, third son of William I. and Matilda, was born in 1056. Little is known of his youth, except that in the quarrel between the Conqueror and Robert he remained loyal to his father. When the Conqueror was on his death-bed he sent William to England with a letter to Lanfranc, requesting the archbishop to secure his election to the throne. Accordingly on 26th September, 1087, William was elected and crowned at Westminster. His brother Robert, to whom the Conqueror had bequeathed the duchy, was not likely to give up his claim to the larger part of his father's dominions without a struggle. A general revolt in his favor broke out in the summer of 1088. Roger Bigod rose in Norfolk, Roger, earl of Shrewsbury, and Robert of Mowbray on the western border, while Odo of Bayeux, the king's uncle, whom he had reinstated against his father's advice in the earldom of Kent, occupied Rochester. But there was little combination among the rebels. After being foiled in attacks on Ilchester and Worcester, the rebellion in the west seems to have died away. William won over the earl of Shrewsbury, and summoned his English subjects to his aid. He promised good government, the repeal of the forest laws, and the reduction of taxes. Thus conciliated, the *fyrd*, or national levy, flocked to his standard. It was the beginning of that alliance between the monarchy and the people which, fostered by Henry I. and Henry II. and confirmed by the great Edward, secured victory for the crown in its struggle with the feudal aristocracy. With the aid of his English troops William took castle after castle, repelled an attempted landing of the Norman fleet and forced Odo to surrender his stronghold of Rochester. The rebellion being thus suppressed, he held a great council, at which, although the rebels in general were leniently treated, many confiscations and sentences of banishment were pronounced. A later meeting at Salisbury (November, 1088), was notable for the trial of William of Saint-Calais, bishop of Durham, who had been one of the chief promoters of the rebellion. The bishop denied the jurisdiction of the king's court and appealed to Rome. It was the first instance of such an appeal. The court, however, acting under the advice of Lanfranc, refused to allow the plea, and the bishop, condemned to lose the temporalities of his see, retired to Normandy.

Two years later William sent an army to Normandy (Easter, 1090), which under the misgovernment of Robert had lapsed into a state of anarchy. The reconquest of the duchy by England was begun by the capture of St. Valéry; but there was not much fighting, place after place yielding to William's lieutenants or to English gold. Robert called King Philip to his aid, but William bribed him to retire. In Rouen itself a popular movement took place for the surrender of the town; but Henry, the duke's youngest brother put a stop to it by killing its leader, Conan, with his own hands. In February, 1091, William himself crossed the Channel, and at once received homage from many of his brother's subjects. Unable to resist, Robert consented to a disgraceful peace. By the treaty of Caen William engaged to pay Robert a sum of money, in return for which he received some of the most important districts of Eastern Normandy, as well as Cherbourg and other places in the west. It was agreed, among other stipulations, that whichever brother died first the other should succeed to his dominions. Later in the same year William marched against Malcolm III., who had invaded Northumberland, and penetrating as far as the Firth of Forth, obliged the Scottish King to do him homage. Whether it was for the whole of Scotland or for Lothian only, history does not say; but the latter is most probable. For an account of the subsequent relations between Malcolm and William, see SCOTLAND, vol. xxi. p. 503. Meanwhile war had broken out again with Normandy. At Christmas, 1093, Robert sent a challenge to his brother, reproaching him with violations of the treaty. Accordingly in March, 1094, William invaded Normandy a second time. On this occasion fortune turned against him. Philip assisted the duke, and William who had exhausted his supplies, was unable to buy him off as before. In this predicament his justiciar, Ralph Flambard, assembled an English army on the pretext of an expedition to Normandy, took from each man the money which had been provided for his expenses, and then dismissed the soldiers to their homes. With the money so obtained William bribed the French king, and then returned to England. Next year the first crusade was being preached, and Robert took the cross. A peace was made between the brothers through papal mediation, William supplying Robert with funds, for the repayment of which the latter pledged his duchy. When in September, 1096, Robert set off for the crusade, William took possession of Normandy, where he soon put an end to the anarchy which had resulted from Robert's misrule; and he held the country till his death. Shortly before the acquisition of Normandy William had subdued a second rebellion in England. Robert of Mowbray was again one of the chief conspirators, and he was joined by William of Saint-Calais, whom the king, in accordance with the treaty of Caen, had restored to his bishopric, and by others. Mowbray refused to obey a summons to the king's court, whereupon William marched against him, captured his castles of Bamborough and Tynemouth, and took him prisoner (1095). As on the suppression of the earlier rebellion, William called a great assembly, this time consisting of all his tenants-in-chief, and by their judgment the rebels were condemned. During the next two years he made a serious attempt at the conquest of Wales. The southern portion of the principality had been to a great extent reduced, first by Harold, afterwards by the Norman border lords. William's efforts were mainly directed against the northern districts. He made three invasions, and penetrated to Snowdon, but seeming victories were immediately followed by revolts, and in the end little ground was actually won.

The last three years of the 11th century were much occupied by tedious wars with France and efforts to recover Maine. In 1097 he quarrelled with Philip about Vexin, and crossed the Channel to make good his claim to that district; but the French king was able to hold his own. Next year William set about the recovery of Maine. That territory had been allowed by Robert to slip out of his hands, and had been governed since 1091 by Helias de la Flèche. William's vassal, Robert of Bellême, attacked Helias, and, having succeeded in taking him prisoner, handed over his prize to the king. William thereupon marched into Maine, and a desultory war of forays, sieges, and skirmishes followed. Fulk of Anjou opposed the Norman claim; but in August, 1098, a treaty was made, by which William's rights over the country were recognized, and Helias was at the same time set free. William now turned again to France. Strengthened by an alliance with the duke of Aquitaine, he invaded the French territory and advanced as far as Pontoise. But, tiring of the fruitless war, he made a truce with Philip and returned to England early in 1099. He had only been there a few months when he heard that Helias de la Flèche was attacking his castles in Maine and had won back Le Mans. He crossed the channel with great speed, and a last campaign replaced him in possession of the coveted borderland. But he took no pains to secure his hold, and the Norman power in Maine fell to pieces immediately on his death.

William II.'s relations with Anselm form perhaps the most important episode of his reign. Lanfranc died in 1089. The worst features of William's character began at once to show themselves. At the instigation or with the assistance of Ralph Flambard, he applied to the possessions of the church all the principles of feudal law developed in the interest of the monarchy. He treated vacant benefices as if they had been lay fiefs and bishops as tenants-in-chief, while he made simony the rule and degraded the heads of the church into servile courtiers. He had kept the see of Canterbury vacant for nearly four years, when a severe illness aroused him to a sense of his enormities. Sending for Anselm, at that time abbot of Bec, he forced the crozier into his unwilling hands (1093). Anselm insisted on three conditions,—that the temporalities of the see should be fully restored, that William should act in ecclesiastical affairs by his counsel, and that he should be allowed to recognize Urban II. as pope. After some hesitation William yielded the first demand, and Anselm did homage for the temporalities. The other two demands remained unsettled. In December, 1093, Anselm was consecrated archbishop of Canterbury. On the outbreak of war against Normandy in 1094 Anselm offered William a contribution of £500 [$6666.67]. William declared the sum insufficient and angrily rejected the gift. Anselm refused to offer more, lest he should seem, even by a gift after his appointment, to be guilty of simony. Other grounds of quarrel were found in the reproofs which the archbishop levelled against the vices of the court, and his demand for ecclesiastical reform. In 1095 a more serious dispute arose. Anselm asked leave to go to Rome in order to obtain his *pallium* from the pope. As this involved a recognition of Urban, and William wished to secure his independence by acknowledging no pope, the permission was refused. The archbishop demanded that the question should be discussed at a great council. Accordingly an assembly was held at Rockingham (March, 1095) in which Anselm was treated by the king as if he had been on trial for contumacy. The bishops sided with the king; the laity took part mostly with the primate. Anselm refused to renounce allegiance to the pope, but denied that this was incompatible with obedience to the king. The assembly broke up without coming to a decision. William now tried to win over the pope and received a legate who brought with him the pall. In the hope of getting the legate to suspend Anselm, he consented to recognize Urban. But, when he found that the pope had no intention of throwing over the archbishop, he reconciled himself with Anselm and allowed him to take the pall from the altar at Canterbury. But it was not long before he found an opportunity of taking his revenge. A contingent of knights sent by the primate to aid the king in his Welsh war (1097) was declared to be worthless, and Anselm was summoned to explain his conduct at court. Tired of the persecution and despairing of reform Anselm, again asked leave to go to Rome. William, believing, whether rightly or not, that Anselm intended to appeal against him, refused his request. Twice repeated, it met with the same answer. Anselm was charged with having broken his oath to observe the laws of the kingdom in threatening to leave England without the king's permission. He answered that he had only sworn to the laws subject to his duty to God and the verdict of his conscience. This answer alienated many who had supported him on the previous occasion. He was asked to swear that he would not appeal against the king, and on his refusal was ordered to leave the country. In October, 1097, Anselm left England. William at once seized the archbishopric and kept possession of it till his death.

The unscrupulous tyranny which Rufus displayed in his quarrel with Anselm was equally characteristic of his temporal government. The feudal customs of aids, reliefs, escheats, etc., were developed into a great system of extortion. The townsfolk and the cultivators of the soil were weighed down by heavy taxes. The forest laws were carried out with ruthless severity. On the other hand, order was maintained, and the tyranny was to a certain extent veiled or limited by the frequent use which William made of his great councils, in the trials of great men like Odo, in the declaration of war, in the settlement of disputes such as that with Anselm. It is clear that the national assembly was neither extinct nor inefficient during this reign. It was in this period too that the office of justiciar became permanent in the person of William's chief minister, Ralph Flambard, although in his hands its powers were used merely in support of despotism.

In his private character William was as vicious as in his public capacity he was tyrannical. He was harsh and violent, extravagant and lustful, regardless of God and pitiless to man. He had a strong vein of mockery and sarcasm, and no little of the grim Norman humor. Almost the only redeeming feature of his character is his chivalrous observation of his plighted word; but for ordinary promises or obligations he had no respect. He died under mysterious circumstances in the New Forest, Hampshire, on 2d August, 1100. William II. was not married; he was succeeded by his brother Henry.

(G. W. P.)

WILLIAM III. (1650–1702), king of England and prince of Orange,[1] was the son of William II., stadtholder of the United Netherlands, and Mary, daughter of Charles I. of England. He was born on 14th November, 1650. His father died eight days before his birth, whereupon the states-general abolished the office of stadtholder. As he grew up, William became the head of the party, at once democratic and monarchical, which was attached to the house of Orange. But all power was concentrated in the hands of John de Witt and other leaders of the rival or aristocratic republican party. Hence William learned caution, reserve, insight into character, and the art of biding his time.

When, however, France and England declared war upon the Netherlands in the spring of 1672, the rapid success of the French arms, and the rejection by Louis of the terms offered by the Dutch Government, produced a revolution in favor of William. A popular rising obliged De Witt to repeal the perpetual edict (which ratified the suppression of the stadtholdership in 1667), and on 8th July, 1672, the prince of Orange was declared by the states-general stadtholder, captain-general, and admiral for life. The revolution was followed by a riot in which John and Cornelius de Witt lost their lives. There appears no evidence connecting William with the attack on the De Witts; but he made no attempt to punish it: on the contrary he rewarded the leaders. Then, rejecting the outrageous terms offered by the allies, he placed his private fortune and the revenues of his offices at the disposal of the state, and declared himself ready to die in the last ditch. In order to check the French advance the sluices were opened and vast tracts of country placed under water. The Dutch fleet prevented an English landing. An alliance was made with the elector of Brandenburg, whose forces effected a useful diversion on the eastern frontier. Next year (1673) William lost Maestricht, but he more than balanced this disaster by treaties with Spain and the empire. The war now began to turn in his favor. Early in 1674 the French troops evacuated Holland, and in February of the same year peace was made with England in the treaty of Westminster. As the tide turned, William's allies became more active in his behalf. The league of The Hague, the first of those great coalitions by which he sought to set a limit to the aggressions of Louis XIV., was joined by the elector of Brandenburg, who had been obliged a year before to come to terms with France, and by several other German princes. In Flanders William himself opposed Condé and fought the indecisive battle of Seneffe (August, 1674). For the next two years the war dragged on without very important results. William, although he had saved Holland, could not prevent France from winning places at the expense of the empire and Spain. In April, 1677, he was decisively beaten by the duke of Orleans near St. Omer. A great part of the Spanish Netherlands as well as Franche Comté was now in the hands of France. These advances caused much alarm in England; and the prince of Orange linked himself closer to that country by marrying Mary, elder daughter of James, duke of York, in November, 1677. Early next year William signed a treaty of alliance with England, the object of which was to compel Louis to come to terms. The duplicity of Charles and the attitude of the country party in England, anxious for war with France but unwilling to put an army into the king's hands, prevented this arrangement from taking effect. A fresh treaty was, however, made between the two powers (July), and the pressure thus brought to bear upon Louis led to the peace of Nimeguen (August, 1678). Four days after the peace was signed William attacked the French army under the duke of Luxembourg in its entrenchments round Mons. A sanguinary but resultless battle ensued. William attempted to justify this bloodshed by the insufficient and incredible plea that he was not aware that the peace had been signed. He can hardly have wished to prolong the war; but it is not surprising if he was dissatisfied with a peace which gave Franche Comté and many places in the Spanish Netherlands to France.

During the years which immediately followed the peace of Nimeguen, Louis's aggressive proceedings provoked a general uneasiness, of which the prince of Orange made skilful use. The French king had seized on William's ancestral principality of Orange in the south of France. William declared publicly that he would make Louis repent the outrage, and when called on to withdraw his words refused to do so. Personal affront was thus added to the national grounds of his hostility. The second of his coalitions against France began by a treaty between the Netherlands and Sweden (October, 1681) for the maintenance of the peace of Nimeguen, which was soon joined by the empire and Spain, and by several of the German states. When, however, Louis declared war on Spain, invaded the Spanish Netherlands, and even took Luxemburg (1683–84), William could not persuade the states-general to raise an army, and the allied powers acquiesced in the truce of Ratisbon, which left the French king in possession of all that he had won (1685). Certain claims on the Palatinate which Louis urged on behalf of his sister-in-law, the duchess of Orleans, gave William an occasion for organizing a further combination against him. In July, 1686, the emperor, with the kings of Spain and Sweden, acting as members of the empire, and the most important German princes entered into the league of Augsburg, which, however, William did not himself join.

---

[1] For some account of this family, see HOLLAND, vol. xii. pp. 77 and 85 *sq.*

Meanwhile, as heir presumptive to the English throne, he paid close attention to what was passing in England. He sought to win Charles by sheltering the duke of Monmouth during the exile to which his father had unwillingly condemned him. The same motive led him to dismiss the duke when James II. succeeded his brother, and to discourage the attempt which Monmouth made to win the crown. He also endeavored to stop Argyll and his friends when they were setting out for England; and he tried to dissuade Monmouth from his rash expedition, and to induce him to take service against the Turks in Hungary, and, when this failed, he sought, with as little success, to prevent his crossing to England. Throughout the whole crisis he showed a scrupulous regard for the interests of his father-in-law, which fortunately coincided with his own; but at the same time he astutely avoided any step which would have alienated from him the constitutional party. When, however, James II. began to show himself in his true colors, William became the head of the opposition in England. As such, he strongly disapproved of the first Declaration of Indulgence (1686) and remonstrated with James on the unconstitutional nature of his act. When the king requested him, a year later, to place Papists instead of Protestants in command of the English regiments then in the service of Holland, he declined to do so, and rejected with equal firmness a demand from James that he should send the troops back to England. Nevertheless he refused to listen to Mordaunt's premature suggestion that he should undertake an invasion in 1686, and, even when Edward Russell visited him at The Hague (May, 1688), he was unwilling to move till he was assured that the majority of the nation would be with him. The letter, signed by seven leaders of the two great English parties, which Admiral Herbert carried to Holland (June, 30) set his scruples at rest.

On 30th September he issued a declaration in which he recapitulated James's unconstitutional acts, and stated that he was coming to England in order to secure the assembling of a free parliament, by whose decision he was resolved to abide. On 2d November he sailed from Holland, and three days later landed at Torbay. At first only few persons joined him, but presently the gentry began to come in. James, who had massed his troops at Salisbury, was compelled by William's advance and by the desertion of Churchill and others to fall back upon London. Here he attempted to treat with the invader. William, anxious to avoid all appearance of conquest, consented to negotiate, and it was agreed that a parliament should be summoned, both armies meanwhile holding aloof. James, however, attempted to leave the country, but was stopped and returned to Whitehall. For a moment he seemed to contemplate resistance, but William now insisted on his retiring from London. His final flight relieved the prince of a great difficulty. On 19th December William arrived in London, and at once called a meeting of peers and others who had sat in the parliaments of Charles II.'s reign. By their advice he summoned a convention, which met on 22d January, 1689, and settled the crown on William and Mary, who, after accepting the Declaration of Rights, were on 13th February proclaimed king and queen.

The revolution had so far succeeded beyond expectation; but William's difficulties had only begun. His primary object was to bring England into the field against France. But he had first to secure his own throne, which was still endangered by resistance in Scotland and Ireland: in order to do it with effect he had to gain the good will of the English parliament and to harmonize or control its two great factions, which, momentarily united by the imminence of despotism, were again almost on the verge of civil war. He wished to be superior to party, which he could only become by being independent of parliament, and this the revolution had rendered impossible. The revolution was due mainly to the Whigs, who were therefore William's natural allies; but the political principles of the Whigs led them to curtail the power of the sovereign. The principles of the Tories were much more to his taste; but the Tories were disinclined to apply their principles on behalf of a sovereign whose title they could not conscientiously acknowledge. In selecting his first ministry William endeavored to conciliate both sides and to hold the balance even. He eventually saw that such a policy was impracticable, and that, the nation having arrived at its majority, ministers must represent the party which was strongest in parliament. His natural reluctance to recognize this change, or to give up any of the powers which his predecessors had possessed, led to not unfrequent collisions with parliament and exposed him to some humiliation, while the strugle between the two parties at times reduced him to despair, and constantly hampered his action on the Continent.

For nearly a year and a half after William's acceptance of the crown he was occupied in forming the coalition against Louis XIV. known as the Grand Alliance. As stadtholder of the United Netherlands, William had already entered into an alliance with the emperor. In December he joined the league as king of England, and in 1690 the coalition was completed by the adhesion of Spain, Brandenburg, and Savoy. William had thus gained his first great object: he had united Europe against the Bourbon. Meanwhile, however, his arms had made little progress in Scotland and Ireland. James had landed in Ireland in March, 1689, and nearly the whole island was in his hands. The relief of Londonderry (July) and the battle of Newtown Butler (August) saved the north for William, but elsewhere Schomberg could make no way. In Scotland the convention had offered the crown to William and Mary; but in the battle of Killiecrankie (July) the clans under Dundee had routed William's army. The convention, which shortly after his accession had been turned into a parliament, met for its second session in the autumn of 1689, and the two parties quarrelled so violently over the Corporation and Indemnity Bills that William threatened to leave the country. He was induced by Nottingham and Shrewsbury to give up this intention, but in January, 1690, he dissolved the parliament. William put an end to the quarrel about the indemnity by issuing an Act of Grace, which gave an almost complete amnesty; and after placing the government in the hands of the queen and a council of nine persons, he left for Ireland. The defeat of the English and Dutch fleets off Beachy Head and the repulse of the allied forces at Fleurus (June and July, 1690) were severe blows to William's hopes; but the former led to no important results and the latter was more than balanced by the victory which William won at the battle of the Boyne (1st July, 1690). James fled from the country, and William entered Dublin in triumph. In September he returned to England, leaving Marlborough to conquer the south of Ireland in a short but brilliant campaign. Meanwhile the resistance in Scotland had collapsed, and Mackay reduced the Highlands to tranquillity. In 1691 William was able to go abroad and to take the command in Flanders, where, however, his efforts were unsuccessful.

The next year (1692) opened with the massacre of Glencoe. It is improbable that, in signing an order for the "extirpation" of the Macdonalds, he intended that the order should be literally executed. Nevertheless, the order came from him, and he cannot be acquitted of all blame. About the same time the insecurity of his position was shown by the discovery of Marlborough's treachery; and Marlborough did not stand alone. While many whom William trusted or appeared to trust were intriguing with James, an invasion of England was being organized by the French Government. Fortunately, and in great measure owing to the politic conduct of Mary, the commanders of the fleet were induced to stand firm, and the great victory of La Hogue (19th May, 1692) put a stop to the projected invasion. But the fortune of war went against William on the Continent. He could not save Namur from the French, and he was severely defeated in an attempt to surprise the duke of Luxembourg at Steenkerke (4th August, 1692). Next year he was again beaten by the same commander at Neerwinden (19th July). The battle of La Hogue had not given England the command of the seas, and French privateers inflicted great damage on English trade. In June, 1693, the Smyrna fleet was almost entirely destroyed off Cape St. Vincent.

In spite of these reverses William struggled on with indomitable courage, and he was well supported by the country. Parliament, under the skilful guidance of Montague, adopted various important financial measures to meet the expenses of the war. The land-tax was re-assessed, the national debt created, the Bank of England established, and the coinage renewed (1693–95). In 1694 William confirmed the parliamentary system by giving his consent, though an unwilling consent, to the Triennial Act, and he recognized the principles of ministerial government by modifying the ministry, until in 1696 it was in thorough harmony with the parliamentary majority. In 1695 William won his first important success on the Continent by recovering Namur, and, though no advance was made by the allies next year, the exhaustion of France was becoming more and more evident. At length, in March, 1697, a congress met at Ryswick, and in September peace was made. Louis was obliged to give up all (with the exception of Strasburg) that he had added to his dominions since 1678, and he recognized William as king of England. With the conclusion of the war the dread of a standing army revived in England, and, much to William's disgust, a vote of parliament reduced the military force to 10,000 men, although the question of the Spanish succession (see vol. ix. p. 511) was pending. The new parliament which met early in 1699 reduced the army still further and resolved that it should consist solely of English troops, thus compelling William to dismiss his favorite Dutch guards. They went on to institute an inquiry into the manner in which the forfeited estates in Ireland had been disposed of, and in their second session (November, 1699) they passed a bill for the "resumption" of these estates. William died on 8th March, 1702, from the consequences of a fall from his horse on 20th February.

WILLIAM IV. (1765–1837), king of England, was the third son of George III. He was born at Windsor, 21st August, 1765. When he was fourteen years old he was sent to sea as a midshipman under Admiral Digby. Next year he sailed under Rodney and took part in the action off Cape St. Vincent (16th January, 1780). During the rest of the war the young prince saw plenty of service, for which he imbibed a strong liking, and so laid the foundation of his popularity. On the conclusion of the war he travelled in Germany, visiting Hanover and Berlin, where he was entertained by Frederick the Great. In 1785 he passed for lieutenant; next year he was made captain and stationed in the West Indies. Shortly after 1787, being tired of his station, he sailed home without orders, and was punished for his insubordination by being obliged to stay at Plymouth till his ship was refitted, when he again sailed for the West Indies.

In 1789 he was made duke of Clarence. When war was declared against the French republic in 1793, he strongly supported it and was anxious for active employment; but, though he was made rear-admiral of the red, he could obtain no command. Thus condemned to inactivity, he amused or revenged himself by joining the prince of Wales and the duke of York in their opposition to the king. He threw himself into the dissipations of society, and his hearty geniality and bluff, sailor-like manners gained him popularity, though they did not secure him respect. He took his seat in the House of Lords, where he defended the extravagancies of the prince of Wales, spoke on the Divorce Bill, vehemently opposed the emancipation of slaves, and defended slavery on the ground of his experience in the West Indies. Meanwhile he formed a connection with Mrs. Jordan, the actress, with whom he lived on terms of mutual affection and fidelity for nearly twenty years, and the union was only broken off eventually for political reasons. During all this period the prince had lived in comparative obscurity. The death of Princess Charlotte in 1817 brought him forward as in the line of succession to the crown. In 1818 he married Adelaide of Saxe-Meiningen, a lady half his age, without special attractions, but of a strong, self-willed nature, which enabled her subsequently to obtain great influence over her husband. On the death of the duke of York in 1827 the duke of Clarence became heir to the throne, and in the same year he was appointed lord high admiral. In discharging the functions of that office he endeavored to assume independent control of naval affairs, although his patent precluded him from acting without the advice of two members of his council. This involved him in a quarrel with Sir George Cockburn, in which he had to give way. As he still continued to act in defiance of rules, the king was at length obliged to call upon him to resign.

On 28th June, 1830, the death of George IV. placed him on the throne. During the first two years of his reign England underwent an agitation more violent than any from which it had suffered since 1688. William IV. was well-meaning and conscientious; but his timidity and irresolution drove ministers to despair, while his anxiety to avoid extremes and his want of insight into affairs prolonged a dangerous crisis and brought the country to the verge of revolution. Immediately after his accession the revolution of July broke out in France and gave a great impulse to the reform movement in England. The king, though he called himself an "old Whig," did not dismiss the Tory ministry which had governed the country during the last two years of his brother's reign; but the elections for the new parliament placed them in a minority. Within a fortnight of the opening of parliament they were beaten on a motion for the reform of the civil list, and resigned. Lord Grey undertook to form a ministry, with the avowed intention of bringing in a large measure of reform. This was not in itself displeasing to the king, who had liberal tendencies, and a few years before had supported Catholic emancipation. But, when the struggle in parliament began, his disinclination to take up a decided attitude soon exposed the Government to difficulties. The first Reform Bill was introduced on 1st March, 1831; the second reading was carried on 21st March by a majority of one. Shortly afterwards the Government were beaten in committee, and offered to resign. The king declined to accept their resignation, but at the same time was unwilling to dissolve, although it was obvious that in the existing parliament a ministry pledged to reform could not retain office. From this dilemma

William was rescued by the conduct of the opposition, which, anxious to bring on a change of ministry, moved an address against dissolution. Regarding this as an attack on his prerogative, William at once dissolved parliament (April, 1831). The elections gave the ministry an overwhelming majority. The second Reform Bill was brought in in June, and passed its third reading (21st September) by a majority of 109. A fortnight later (8th October) the Lords threw out the Bill by a majority of 41. For an account of the subsequent stages of the struggle, see Grey, vol. xi. pp. 171–172.

During the rest of his reign William IV. had not much opportunity of active political interference, but on one other occasion he made an unjustifiable use of his prerogative. Two years after the passing of the Reform Bill the ministry of Lord Grey had become unpopular. In July, 1834, Lord Grey himself retired and Lord Melbourne took the lead. There were divergences of opinion in the cabinet, and the king strongly objected to the ministerial policy respecting the Irish Church. On the shallow pretext that Lord Althorp's removal to the Upper House would weaken the ministry in the House of Commons, where, however, they still had a majority, he suddenly dismissed them and summoned Sir Robert Peel (14th November). Peel's ministry, containing many members who had been in the government on the king's acession, was called from its short duration "the ministry of the hundred days." Its formation clearly indicated that the Whig proclivities of the king, which had never been more than partial or lukewarm, had wholly disappeared. The step was regarded with general disapprobation. It was immediately followed by a dissolution, and the ministry soon found themselves in a minority. Beaten on Lord John Russell's motion respecting the Irish Church (3d April, 1835), Peel resigned and Melbourne again came into power. Under him the Whigs retained the lead during the remainder of the reign. This *coup d'état* of November, 1834, was the last occasion on which the English sovereign has attempted to impose an unpopular ministry on the majority in parliament.

In May, 1837, the king began to show signs of debility, and died, from an affection of the heart, on the 20th of June, leaving behind him the memory of a genial, frank, warm-hearted man, but a blundering, though well-intentioned prince. He was succeeded by his niece Victoria.

WILLIAM, surnamed the Lion, king of Scotland from 1165 to 1214. See Scotland, vol. xxi. p. 506.

WILLIAM I. (1797–1888), king of Prussia and German emperor, was the second son of Frederick William III. of Prussia and Louisa, a princess of Mecklenburg-Strelitz. He was born at Berlin on 22d March, 1797, and received the names of Wilhelm Friedrich Ludwig. He was a delicate child and had to be carefully nurtured. His constitution, however, was sound, and he became one of the most vigorous men in Germany. After the battle of Jena he spent three years at Königsberg and Memel. Meanwhile he had given evidence of sterling honesty, a strict love of order, and an almost passionate interest in everything relating to war. On 1st January, 1807, he received an officer's patent, and on 30th October, 1813, was appointed a captain. William accompanied his father in the campaign of 1814, and early in the following year received the iron cross for personal bravery shown at Bar-sur-Aube. He took part in the entry into Paris on 31st March, 1814, and afterwards visited London. He joined the Prussian army in the final campaign of the Napoleonic wars, and again entered Paris. The prince was made a colonel and a member of the permanent military commission immediately after his twentieth birthday, and at the age of twenty-one became a major-general. In 1820 he received the command of a division; and during the following nine years he not only made himself master of the military system of his own country but studied closely those of the other European states. In 1825 he was promoted to the rank of lieutenant-general, and obtained the command of the corps of guards. On 11th June, 1829, he married Augusta of Saxe-Weimar.

On the death of his father in 1840—the new king, Frederick William IV., being childless—Prince William, as heir presumptive to the throne, received the title of prince of Prussia. He was also made lieutenant-governor of Pomerania and appointed a general of infantry. In politics he was decidedly Conservative; but at the outbreak of the revolutionary movement of 1848 he saw that some concessions to the popular demand for liberal forms of government were necessary. He urged, however, that order should be restored before the establishment of a constitutional system. At this time he was the best-hated man in Germany, the mass of the Prussian people believing him to be a vehement supporter of an absolutist and reactionary policy. He was even held responsible for the blood shed in Berlin on 18th March, although he had been relieved nine days before of his command of the guards. So bitter was the feeling against him that the king entreated him to leave the country for some time, and accordingly he went to London, where he formed intimate personal relations with Prince Albert, Sir Robert Peel, Lord John Russell, Lord Palmerston, and other English statesmen. On 8th June he was back at Berlin, and on the same day he took his seat as member for Wirsitz in the Prussian national assembly, and delivered a speech in which he expressed belief in constitutional principles. In 1849, when the revolutionary party in the grand-duchy of Baden became dangerous, he accepted the command of "the army of operation in Baden and the Palatinate," and his plans were so judiciously formed and so skilfully executed that in the course of a few days the rebellion was crushed. At the beginning of the campaign an unsuccessful attempt was made on his life. In October, 1849, he was appointed military governor of the Rhineland and Westphalia, and took up his residence at Coblentz. In 1854 the prince was raised to the rank of a field marshal and made governor of the confederate fortress of Mainz. When the king was attacked with a disease of the brain, Prince William assumed the regency (7th October, 1858).

On 2d January, 1861, Frederick William IV. died, and his brother succeeded him as William I. For the internal conflict between the king and the house of representatives on the question of military reorganization, which filled up the first years of his reign, see Germany (vol. x. p. 457) and Prussia (vol. xx. p. 16). The events and the results of the war with Denmark, and of that with Austria which arose out of the Schleswig-Holstein question, belong to the history of Austria and of Prussia, and have been already described under those articles. The brilliant achievements of the army in this last contest finally convinced the king's subjects that his aims had been wise. On his return to Berlin he was received with unbounded enthusiasm, and from this time he was looked up to as a father rather than as a sovereign. On the outbreak of the war with France in 1870 all Germans rallied around the king of Prussia, and, when on 31st July he quitted Berlin to join his army, he knew that he had the support of a united nation. He crossed the French frontier on the 11th of August, and personally commanded at the battles of Gravelotte and Sedan. It was during the siege of Paris, at his headquarters in Versailles, that he was proclaimed German emperor on 18th January, 1871. On 3d March, 1871, he signed the preliminaries of peace which had been accepted by the French assembly; and on 21st March he opened the first imperial parliament of Germany. On 16th June he triumphantly entered Berlin at the head of his troops.

After that period the emperor left the destinies of Germany almost entirely in the hands of Bismarck, who held the office of imperial chancellor (see PRUSSIA). In his personal history the most notable events were two attempts upon his life in 1878,—one by a working lad called Hödel, another by an educated man, Karl Nobiling. On the first occasion the emperor escaped without injury, but on the second he was seriously wounded. These attacks grew out of the socialist agitation; and a new reichstag, elected for the purpose, passed a severe anti-socialist law, which was afterwards from time to time renewed. The socialists, however, far from being crushed, again and again gave proof of their power by returning a considerable number of deputies to parliament. In the hope of alienating from them the mass of the working class, Bismarck introduced, with the cordial approval of the emperor, a series of measures for the benefit of the poorer members of the community. Until within a few days of his death the emperor's health was remarkably robust; he died at Berlin on 9th March, 1888.

The reign of William I. marked an era of vast importance in the history of Germany. In his time Prussia became the first power in Germany and Germany the first power in Europe. These momentous changes were due in a less degree to him than to Bismarck and Moltke; but to him belongs the credit of having recognized the genius of these men, and of having trusted them absolutely. Personally William was a man of a singularly noble and attractive character. His supreme wish was to discharge loyally the duties which had been imposed upon him, and he never shrank from any personal sacrifice that seemed to be demanded in the interests of his people. The best traditions of the Hohenzollerns were maintained, not only by the splendor of the achievements with which his name will always be intimately associated, but by the simplicity, manliness, and uprightness of his daily life.

WILLIAM IV. (1532–1592), landgrave of Hesse, well known as an astronomer, son of Philip the Magnanimous, was born at Cassel on 14th June, 1532. During his father's captivity after the battle of Mühlberg (1547) he carried on the government in his name for five years, and succeeded him on his death in 1567. At an early age he became interested in astronomy; and in 1561 he built an observatory at Cassel, where observations were regularly made, first by himself, afterwards by Rothmann and Bürgi. The last-named was not only a very skilful mechanic (it seems probable that he applied the pendulum to clocks long before Huygens did) but an original mathematician, who independently invented logarithms. William died on 25th August, 1592.

Most of the mechanical contrivances which made Tycho Brahe's instruments so superior to those of his contemporaries were adopted at Cassel about 1584, and from that time the observations made there seem to have been about as accurate as Tycho's; but the resulting longitudes were 6′ too great in consequence of the adopted solar parallax of 3′. The principal fruit of the observations was a catalogue of about a thousand stars, the places of which were determined by the methods usually employed in the 16th century, connecting a fundamental star by means of Venus with the sun, and thus finding its longitude and latitude, while other stars could at any time be referred to the fundamental star. It should be noticed that clocks (on which Tycho Brahe depended very little) were used at Cassel for finding the difference of right ascension between Venus and the sun before sunset; Tycho preferred observing the angular distance between the sun and Venus when the latter was visible in the daytime. The Hessian star catalogue was published in Lucius Barettus's *Historia Cœlestis* (Augsburg, 1668), and a number of other observations are to be found in *Cœli et Siderum in eo Errantium Observationes Hassiacæ*, Leyden, 1618, edited by SNELLIUS (*q.v.*). R. Wolf, in his "Astronomische Mittheilungen," No. 45 (*Vierteljahrsschrift d. naturforschenden Gesellschaft in Zürich*, 1878), has given a résumé of the manuscripts still preserved at Cassel, which throw much light on the methods adopted in the observations and reductions.

WILLIAM (1533–1584), surnamed the SILENT, prince of Orange, count of Nassau, was born at the castle of Dillenburg in Nassau on 16th April, 1533. He was the eldest son of William of Nassau (died 1559) and his second wife, Juliana of Stolberg, a woman of remarkable piety and discretion, who devoted much thought and care to the training of her children. In 1544 he inherited from his cousin René or Renatus the principality of Orange and the great estates belonging to his family in the Netherlands (see HOLLAND, vol. xii. p. 77 *sq.*). He was educated at the court of Brussels in the Roman Catholic faith. Having attracted the attention of Charles V., he was invested by the emperor at the age of twenty-two with the command of the army on the French frontier; and it was on his shoulder that Charles V. leaned when in 1555, in the presence of a great assembly at Brussels, he transferred to his son Philip the sovereignty of the Netherlands [see vol. v. p. 361]. Orange was also selected to carry the insignia of the empire to Ferdinand, king of the Romans, when Charles resigned the imperial crown. He took part in Philip II.'s first war with France, and negotiated the preliminary arrangements for the treaty of Cateau-Cambrésis (1559). He was one of the hostages sent to France for the due execution of the treaty, and during his stay in that country Henry II., who entirely misunderstood his character, revealed to him a plan for the massacre of all Protestants in France and the Netherlands. The prince was horrified by this disclosure, but said nothing; and it was on account of his extraordinary discretion on this occasion that he received the surname of "the Silent." The epithet is apt to convey a mistaken impression as to his general character. He was of a frank, open, and generous nature, without a touch of moroseness in the ordinary intercourse of life.

The persecution of the Protestants in the Netherlands, carried on with such reckless ferocity by Cardinal Granvella, led Orange, Egmont, and Horn, the most prominent of the great nobles, to protest against the violence of the government; and in 1563 they wrote to Philip urging him to withdraw Granvella, and ceased to attend the state council. In the following year Granvella was displaced, whereupon they resumed their seats at the council; yet shortly afterwards it was decided by Philip that the canons of the Council of Trent, the edicts, and the Inquisition should be immediately promulgated in every town and village of the provinces, and that the process should be repeated every six months. At the meeting of the state council at which this was formally decided Orange disclaimed any responsibility for the consequences, and he whispered to his neighbor that now the most extraordinary tragedy the world had ever seen was about to begin. The proceedings of the Gueux or reforming party so alarmed the regent, Margaret of Parma, that she was persuaded to sign an accord, declaring the abolition of the Inquisition and granting liberty of worship in all places where the new forms of religion had been already accepted. In consequence of these concessions the great nobles undertook to restore order, the prince of Orange especially distinguishing himself at Antwerp. But Philip, who had been longing for an excuse to crush the independent spirits of the Netherlanders, now resolved to send the duke of Alva into the country, with a Spanish force. Orange, since he could not count upon the hearty support of Egmont or Horn, had no alternative but to resign his offices and withdraw from the Netherlands (1567), taking up his residence at Dillenburg. He was warmly attached to Egmont, and before his departure, at an interview at Willebroeck, urged him to seek refuge in some foreign land; but Egmont was not to be persuaded, and the two friends parted never to see one another again.

Orange was repeatedly summoned to Brussels; but he declined to appear before the Council of Disturbances, on the ground that it had no jurisdiction over an independent prince and a knight of the order of the

Fleece. The havoc wrought by Alva filled him with grief and anger; and in 1568 he contrived to collect two forces, one of which, commanded by his brothers Louis and Adolphus, gained a victory in Groningen, where Adolphus fell. Alva, having ordered the execution of Egmont and Horn, advanced against Louis and defeated him in East Friesland. Orange then invaded Brabant, but could neither bring Alva to a decisive engagement nor induce the people to rise against him. The army had therefore to be disbanded, and its disappointed leader joined Wolfgang of Zweibrücken in an attempt to aid the Huguenots. Acting on the advice of Coligny, Orange issued letters of mark to seamen against the Spaniards; and for years the “sea beggars” harassed the enemy along the coast, and often did no little harm to their own countrymen. In 1572 the revolt against Spain was so far successful that Orange resumed the functions of stadtholder of Holland and Zealand, a position to which he had been appointed in 1559; but he professed to rule in the name of the king, for as yet the people had no wish to throw off their allegiance to the Spanish crown. Orange had won their confidence not only by acting as their champion but by accepting the Protestant faith. He had never been an enthusiastic Catholic, and as a Protestant he was distinguished among the eminent men of his time by his mastery of the true principles of toleration. Meanwhile he had been using the utmost diligence in bringing together an army, and his brother Louis, by a brilliant stroke, had captured the city of Mons. On 15th July, 1572, the estates of Holland met at Dort, and, recognizing Orange as the legal stadtholder of Holland, Zealand, Friesland, and Utrecht, voted the sums necessary for the prosecution of the war. In August he crossed the Meuse at the head of an army, trusting mainly to the promised co-operation of France. All his hopes, however, were shattered by the massacre of St. Bartholomew. He was obliged to disband his troops, and Mons was retaken by the Spaniards. On 14th April, 1574, at the village of Mook, near Nimeguen, the patriots were again routed, and Orange's brothers, Louis and Henry, slain. But many fortified places held out, and on 3d October Orange, who had ordered the country to be inundated, was able to relieve Leyden, which had for months been defended with splendid bravery and self-sacrifice. At length the brutality and despotism of the Spaniards were so fiercely and generally resented that Orange was able to enter upon a series of negotiations, which resulted on 8th November, 1576, in the pacification of Ghent, signed on behalf of nearly all the provinces. By this treaty the provinces bound themselves to drive the Spaniards from the Netherlands, to convoke the states-general, and to establish freedom of worship both for Roman Catholics and for Protestants.

Don John of Austria, Spanish regent of the Netherlands (1576–78), granted all the demands of the states; but Orange was suspicious of the intentions of the Government, and in no way relaxed his vigilance. Troubles soon broke out, and Orange was called to Brussels to the aid of the states, being elected *ruwaard* (governor) of Brabant. When the archduke Matthias (afterwards emperor) was invited by the Catholic nobles to accept the position of governor-general, Orange prudently refrained from resisting the scheme; and he acted with equal discretion in regard to the duke of Alençon, who came nominally as the protector of the liberties of the Netherlands. Orange, however, retained in his own hands complete control over the movement in the seven northern provinces, which by the Union of Utrecht, signed on behalf of five of the provinces on 23d January, 1579, laid the foundations of the commonwealth of the United Netherlands. Orange's relation to the new federal republic was somewhat vaguely defined; but in his lifetime it was not felt that there was any very urgent need for an exact delimitation of the relative functions of the executive and the legislative authorities. Negotiations for the conclusion of peace with Spain were carried on for some time in vain; and in 1580 Philip issued a ban against the prince, and set a price of 25,000 gold crowns [$43,466.75] upon his head. Orange published a vigorous “apology,” and on 26th July, 1581, the estates of the United Provinces formally renounced their allegiance to the Spanish crown. An unsuccessful attempt on the life of Orange was made in 1582. But on 10th July, 1584, he was shot dead in his house at Delft by Balthazar Gerard, who seems to have been actuated in part by fanaticism, in part by the hope of gain.

William of Orange was tall and well-formed, of a dark complexion, with brown hair and eyes. He was a man of a singularly upright and noble character. He has been charged with excessive ambition; but his ruling motive was undoubtedly a love of justice, for the sake of which he often risked his life and willingly sacrificed his wealth and leisure. He was a born statesman, capable of forming wise and far-reaching plans, and of modifying them to suit the changing circumstances in which it was necessary to execute them. In moments of difficulty he displayed splendid resource and courage, and he had a will of iron, which misfortunes were never able either to bend or to break. To him chiefly belongs the honor of having permanently crippled the tyrannical power of Spain, and of having founded the independence and greatness of the United Provinces.

He was married four times. His wives were (1) Anne of Egmont (died 1558), by whom he had a daughter and a son, Philip William, who was seized by Alva in 1567 and sent to the court at Madrid, where he was educated; (2) Anne of Saxony (divorced in 1575, died in 1577), the mother of several daughters and of Maurice of Orange (see HOLLAND, vol. xii. pp. 80–81); (3) Charlotte of Bourbon (died 1582), who had six daughters; (4) Louisa, Coligny's daughter, the mother of Frederick Henry of Orange (*loc. cit.*, pp. 81–82), who represented the family after the death of his two elder brothers, and succeeded Maurice as stadtholder.

WILLIAM of Holland, second count of the name, was born about 1227, succeeded his brother Floris IV. in 1235, and was chosen king of the Romans by the papal party in 1247. See GERMANY, vol. x. p. 441, and HOLLAND, vol. xii. p. 74. He died on 28th January, 1256.

WILLIAM I., king of the Netherlands from 1815 to 1840, was born at The Hague on 24th August, 1772, and died at Berlin on 7th November, 1843. His son, WILLIAM II. (1792–1849), reigned from 1840, and was in turn succeeded by his son, WILLIAM III. (born 1817). See HOLLAND, vol. xii. p. 84.

WILLIAM, archbishop of Tyre, was doubtless a native of the Holy Land. He was perhaps born about 1137; but this is a mere inference from his own statement that he was still pursuing his studies “across the seas” when Amalric came to the throne (17th February, 1163), and did not return till late in 1166 or early in 1167. As a child he had seen Ralph, the patriarch of Antioch, who died about 1141–42; he remembered the fall of Edessa (December, 1144); and he seems to call himself a contemporary historian from the accession of Baldwin III., an event which he dates 10th November, 1142 (*Hist. Rer. Transmarin.*, xvi., pref., and xix. 4, 12). Unfortunately the chapter (xix. 12) which relates to his own early life has been excised or omitted from every MS. of his great work now extant,—a remark which holds good, not only for the original Latin, but also for the 13th-century French translation. William was appointed archdeacon of Tyre at the request of Amalric on 31st August, 1167. Next summer he was despatched on an embassy to the emperor Manuel. At the time of the disastrous campaign against Damietta (October–December, 1169) he had to take refuge at Rome from the “unmerited anger" of his archbishop. About 1170 he was appointed tutor to Amalric's son Baldwin, afterwards Baldwin IV. A very few months after Baldwin's accession William was made chancellor of the kingdom (*c.* October, 1174), and less than a year later (13th June, 1175) was consecrated archbishop of Tyre. The former office he still held in 1182. He belonged to the commission which negotiated with Philip of Flanders in 1177; and in the following October (1178) he was one of six bishops sent to represent the Latin Church of the East at the Lateran Council (19th March, 1179). He returned home by way of Constantinople, where he stayed seven months (October, 1179–April, 1180) with Manuel. This is his last authentic appearance in history; but we know from his own works that he was writing his *History* in 1182 (xix. 20), and that it breaks off abruptly at the end of 1183 or the beginning of 1184. Some fifty years later his first continuator accused Heraclius, patriarch of Jerusalem, of having procured William's death at Rome. This story, however, seems to be pure legend; nor perhaps is much more credit to be attached to the theory that identifies him with the archbishop of Tyre sent over to Europe to preach a new crusade in 1188. It is true that Matthew Paris speaks of Henry II.'s receiving the cross from the hands of "Willelmus episcopus Tyrensis;" but more contemporary writers omit the Christian name, while others write it Josce or Joscius.

If not the greatest, William of Tyre is at least among the greatest of mediæval historians. His *Historia Rerum in Partibus Transmarinis Gestarum* is the main authority for the Latin kingdom of the East between 1127, where Fulcher of Chartres leaves off, and 1184, where Ernoul takes up the narrative. It was translated into French in the 13th century, or possibly before the end of the 12th. A little later it was united to Ernoul's chronicle or that of Bernard the treasurer, and continued in more than one form to 1249, 1261 or 1275. In this shape the combined histories form the *Livre d'Outremer* quoted by Joinville (cxvii. § 77),—the standard mediæval account of the exploits of the Frankish warriors in the East. William's own work consists of twenty-two books and a fragment (one chapter and a preface) of book xxiii. It extends from the preaching of the first crusade by Peter the Hermit and Urban II. to the end of 1183 or the beginning of 1184. Like William's other work, the *Historia de Orientalibus Principibus*, it was undertaken at the request of Amalric, who was himself a lover of history and supplied the author with Arabic MSS.; but, whereas the latter book (now unfortunately lost) was mainly based upon the writings of a certain "Seith, the son of Patrick (*Patricii*), patriarch of Alexandria," of the *Historia Transmarina* its author remarks, "In this work we have had no guide, whether Greek or Arab, but have had recourse to traditions only, save as regards a few things that we have ourselves seen." The "traditions" here spoken of must be taken to include the *Gesta Francorum* of Tudebode, Raymund of Agiles, Fulcher of Chartres, and, above all, Albert of Aix. It is only with the accession of Baldwin I., even if so early as this, that William's claim to originality can fairly be sustained; and even here his narrative, till towards the close of book xiii., is based upon that of Fulcher. From this point William of Tyre is indebted to no other historian. Of the remaining books two are devoted to the reign of Fulk (xiv.–xv.), three to that of Baldwin III. (xvi.–xviii.), two to that of Amalric, and the rest to that of Baldwin IV.

No mediæval writer except perhaps Giraldus Cambrensis, possesses William's power of delineating the physical and mental features of his heroes. Again very few had his instinctive sight into what would be of real value to future ages; genealogy, topography, archæology, social life (political and ecclesiastical), military matters and naval, all find a due exposition in his pages. It is hardly too much to say that from his work alone a fairly detailed map of the Levant, as it was in the 12th century, might be constructed; and it is impossible to praise too highly the scrupulous fidelity with which he defines nearly all the technical terms (whether relating to land or sea) of which he makes use. His chief fault is in the matter of chronology, where indeed he is not unfrequently at discord with himself. In the later books his information, even as regards what was taking place beyond the Nile or the Euphrates, as well as in Europe, is singularly exact. Nor did he consider any trouble too severe if by its means he might attain to the truth. Though a man of great learning and almost certainly acquainted with Arabic and Greek, he is as ready to enliven his pages with a country proverb as to embellish them with quotations from Cicero, Virgil, Ovid, or Plato. He was a prelate of pious character, inclined to see the judgment of God on the iniquities of his fellow-countrymen in every disaster that overtook his native land and every Saracen success.

WILLIAM OF CHAMPEAUX. See SCHOLASTICISM, vol. xxi. pp. 440–41.

WILLIAM OF LORRIS, the first author of the *Roman de la Rose*, derives his surname from a small town about equidistant from Montargis and Gien, in the old district of the Gâtinais, and in the present department of Loiret. This and the fact of his authorship may be said to be the only things positively known about him. The rubric of the poem, where his own part finishes, attributes Jean de Meung's continuation to a period forty years later than William's death and the consequent interruption of the romance. Arguing backwards, his death used to be put at about 1260; but Jean de Meung's own work has recently been dated earlier, and so the composition of the first part has been thrown back to a period before 1240. The author represents himself as having dreamed the dream which furnished the substance of the poem in his twentieth year, and as having set to work to "rhyme it" five years later. The general characteristics of the *Roman* will be found noticed under FRANCE (see vol. ix. p. 566). It may be added here that, though the later and longer part shows signs of greater intellectual vigor and wider knowledge than the earlier and shorter, William of Lorris has more poetry than his continuator, made a much greater impression on the spirit of his own and following ages, and is to all appearance more original. The great features of his four or five thousand lines are, in the first place, the extraordinary vividness and beauty of his word-pictures, in which for color, freshness, and individuality he has not many rivals except in the greatest masters, and, secondly, the fashion of allegorical presentation, which, hackneyed and wearisome as it afterwards became, was evidently in his time new and striking. There are of course traces of it before, as in some romances, such as those of Raoul de Houdenc, in the troubadours, and in other writers; but it was unquestionably William of Lorris who fixed the style. And to have fixed a style which captivated Europe for at least two centuries, if not three, does not happen to many of the personages of literary history.

The most convenient edition of the *Roman de la Rose* is that of F. Michel (2 vols., Paris, 1864).

WILLIAM OF MALMESBURY. See MALMESBURY, WILLIAM OF.

WILLIAM OF NEWBURGH, born about 1136, was a canon of Newburgh in the North Riding of Yorkshire, and author of a valuable chronicle of English affairs from the Norman Conquest to 1197. He calls himself Gulielmus Parvus, and is frequently referred to as William Petyt or Little. His work (*Gulielmi Neubrigensis Rerum Anglicarum Libri V.*) was edited by Silvius at Antwerp in 1567 and by Hearne at Oxford in 1719 (3 vols. 8vo); the latest edition is that by H. C. Hamilton for the English Historical Society (*Historia Rerum Anglicarum Willelmi Parvi, S. T. D.*, Ordinis Sancti Augustini Canonici Regularis in Cœnobio B. Mariæ de Novoburgo in Agro Eboracensi, 2 vols., 1856).

WILLIAM OF OCCAM. See OCCAM.

WILLIAM OF WYKEHAM (1324–1404), bishop of Winchester and chancellor of England, was born in 1324 at Wickham in Hampshire. His father was a yeoman; his mother is said to have been of noble descent. He was educated at the priory school, Winchester, at the cost of Sir John Scures, lord of the manor of Wickham and governor of Winchester Castle, who afterwards took him into his service. When he was twenty-two years old he passed into the service of

Edingdon, bishop of Winchester. In 1347 the bishop introduced him to the king as a young man likely to be useful from his skill in architecture. Edward III., who was then completing the Round Tower at Windsor, made him his chaplain. But his employment for some time was mainly secular: he acted as guardian of several of the king's manors and as clerk of the works at Henley and elsewhere. In 1356 he was appointed surveyor of the works at Windsor, and a little later surveyor and warden of several other castles. In 1359 he began the building of the great quadrangle to the east of the keep at Windsor, a work which occupied ten years. This building established his fame as an architect. Two years after its completion he was employed to build Queenborough Castle (Kent). Meanwhile he was also gaining experience in affairs of state. In 1360 he must have been a member of the king's council, for he appears as a witness to the ratification of the treaty of Brétigny. In 1364 he became keeper of the privy seal. In 1365 he was one of the commissioners to treat for peace with Scotland. And, although he was not yet in holy orders, he was loaded by the king with preferments, one of which, the living of Pulham in Norfolk, involved him (about 1360) in a dispute with the pope. In fact he had attained to such eminence that Froissart says, "At this time there reigned in England a priest called Sir William de Wican, so much in favor with the king that by him everything was done."

Early in life William had received the tonsure; but it was not till 1362 that he was ordained deacon and priest. In 1363 he became archdeacon of Northampton, and provost and prebendary of Wells. Although at this time he possessed a number of prebends, it appears, from a return which he made in 1366 on account of a papal bull against pluralities, that he only held one benefice with cure of souls. On the translation of Bishop Edingdon in this year from Winchester to Canterbury William was nominated by the king to the vacant bishopric; but the pope withheld his confirmation for some time, and it was not till October, 1367, that William was consecrated bishop of Winchester. A month previously he had been made chancellor of England. During his first chancellorship the war with France was renewed and went against the English. The blame for this fell in great measure on the ministry, and in 1371 William resigned the great seal. But in 1373 he was one of a committee of the Lords appointed to confer with the Commons on the question of an aid. About this time he fell out with John of Gaunt, with whom he had previously been on good terms. Since the overthrow of the clerical ministry in 1371 John of Gaunt had been practically head of the government, but the conduct of his supporters caused general discontent. In the "Good Parliament" of 1376 Lord Latimer was impeached, and the bishop was active in promoting his trial and punishment. This was a great blow to John of Gaunt. The death of the Black Prince in June, 1376, enabled him to take his revenge. The bishop was attacked in the council on the ground of malversation and misconduct of public affairs during his chancellorship, condemned to pay an enormous fine, and deprived of the temporalities of his see. The other bishops took his side and regarded his punishment as an insult to their order. It was not, however, till after the accession of Richard II. (1377) that William recovered his position. He then received a full pardon, and was reconciled to John of Gaunt.

During the next ten years he became more and more clearly identified with the constitutional or Lancastrian party. In 1380 and 1381 he was named on commissions for the reform of the king's household. In 1382 he took part in a conference with the Commons. Next year he successfully opposed a demand from the lords of the Scottish marches for a share in the public funds, in order to defray the expense of guarding the border, a duty on the performance of which rested their title to their lands. In 1386 he became one of the commission appointed to examine into the Exchequer and to act as a sort of council of regency. It was before this commission that the five "lords appellant" impeached Richard II.'s favorites, who next year were condemned by the "Merciless Parliament." A year later (1389) the king suddenly resumed the reins of power. In order, apparently, to conciliate the clergy, Richard at once offered the great seal to the bishop of Winchester, who after some hesitation accepted the charge. His second chancellorship lasted for two years, and was marked by efforts on his part to reform the government and place it on a more constitutional basis. After he had held office for a year he and his colleagues in the ministry resigned their appointments, and challenged a public inquiry into their conduct. This being pronounced satisfactory, they resumed their offices. The chancellor drew up rules for the conduct of business in the council; and from this time minutes of the proceedings were regularly kept. In 1391 he resigned the great seal, and thenceforward retired from public life.

It is, however, as the founder of two great colleges that William is principally known to fame. Immediately after his promotion to the bishopric of Winchester he appears to have begun to carry out his educational schemes. Between 1369 and 1379 he bought the land enclosed in the northeastern corner of the city walls at Oxford on which New College now stands (see OXFORD, vol. xviii. p. 101). Meanwhile he was taking steps to establish the sister foundation at Winchester. In 1378 he obtained a license from the pope to found a college there, which was confirmed by the king four years later. The ground on which Winchester College stands belonged partly to the bishop and partly to other proprietors, from whom he bought it. In 1387 he began to build, and the buildings were occupied by his scholars in 1393, though they do not appear to have been finished till 1395. When his two colleges were established and endowed, he provided them with statutes, which after several revisions took their final form in 1400. Nor does he appear to have neglected his duties as a bishop. He visited and reformed the hospital of St. Cross near Winchester; he corrected the abuses which had crept into the priory of St. Swithin; and he rebuilt or transformed the nave of Winchester cathedral. He kept a strict watch on the clergy under his charge, endeavoring to ensure their efficiency by frequently moving them from one living to another, and he promoted the material prosperity of his diocese by repairs of bridges and roads. In the relations between England and the papacy William of Wykeham strongly supported the nationalist policy of Edward III. The Statutes of Provisors and Præmunire met with his full approval. So far he was in accord with Wycliffe, but he showed no sympathy with the doctrinal opinions of the reformer. Bishop Courtenay, who headed the attack on Wycliffe, was a life-long friend of the bishop of Winchester, who published in 1382 the interdict condemning Wycliffe's heresies, and in 1392 sat on an episcopal commission to try his follower, Henry Crumpe. William of Wykeham died at Waltham on 27th September, 1404, and was buried in the cathedral of Winchester.

WILLIAMS, JOHN (1796–1839), English missionary, was born at Tottenham near London, on 29th June, 1796. He was trained as an ironmonger, and acquired while young considerable experience in mechanical work. Having offered himself to the London Missionary Society, he was sent, after some training, in 1816 to the South Sea Islands as a missionary. He was first stationed at Eimeo, in the Society Islands, where he rapidly acquired a knowledge of the native language.

After staying there for a short time, he finally settled at Raiatea, which became his permanent headquarters. His success as a missionary here and elsewhere was remarkable. The people rapidly became Christianized and adopted many of the habits of civilization. Williams was fairly liberal for his age, and the results of his labors among the Pacific Islands were essentially beneficial. He travelled unceasingly among the various island groups, planting stations and settling native missionaries whom he himself had trained. From the Society Islands he visited the Hervey group, where he discovered, and stayed for a considerable time on, the island of Rarotonga. Most of the inhabitants of the group were converted in a remarkably short time, and Williams's influence over them, as over the people of other groups, was very great. Besides establishing Christianity and civilization among them, he also, at their own request, helped them to draw up a code of laws for civil administration upon the basis of the new religion. While at Rarotonga he, with the help of the natives, built himself a ship, within about four months; with this he returned to Raiatea, and made voyages among other island groups, including Samoa and the neighboring islands. Williams returned to England in 1834 (having previously visited New South Wales in 1821); and during his four years' stay at home he had the New Testament, which he had translated into Rarotongan, printed. Returning in 1838 to the Pacific, he visited the stations already established by him, as well as several fresh groups. He went as far west as the New Hebrides, and, while visiting Erromango, one of the group, for the first time, was murdered by the natives, 20th November, 1839.

Williams was probably on the whole one of the most successful of Christian missionaries, both as regards the extent and the permanence of the work he accomplished. His *Narrative of Missionary Enterprises in the South Sea Islands* was published in 1837, and formed an important contribution to our knowledge of the islands with which Williams was acquainted. See *Memoir of John Williams*, by Rev. Ebenezer Prout, London, 1843.

WILLIAMS, ROGER (*c.* 1600–*c.* 1684), one of the founders of the colony of Rhode Island, North America, was born either of Welsh or Cornish parents, but this as well as the date of his birth has been the subject of dispute. In early life he went to London, where his skill as a reporter commended him to the notice of Sir Edward Coke, who sent him to Sutton's Hospital (Charterhouse school). From Charterhouse he went to one of the universities, but whether to Oxford or Cambridge there is no direct evidence to show. The register of Jesus College, Oxford, has the following entry under date 30th April, 1624: "Rodericus Williams, filius Gulielmi Williams, de Conwelgaio Pleb., an. Nat. 18." If this entry refers to the founder of Rhode Island he was of Welsh parentage and born about 1606. As Coke was a Cambridge student, the probability is, however, that Williams was sent there; and a Roger Williams matriculated at Pembroke College of that university on 1st July, 1625, and took his B.A. degree in January, 1627. This Roger Williams was the second son of William Williams, and was baptized at Gwinsea, Cornwall, on 24th July, 1600, a date which corresponds with a statement regarding his age made by Williams himself. After leaving the university he entered on the study of law; but, soon forsaking it for theology, he was admitted into holy orders and is said to have had a parochial charge. On account of his Puritan beliefs he left England for Massachusetts Bay, where he arrived in the beginning of 1631. He accepted an invitation to become assistant pastor of a church at Salem, on 12th April, 1631, the same day that the magistrates were assembled at Boston to express disapproval of the scheme. To escape persecution he went to Plymouth, beyond the jurisdiction of Massachusetts Bay, and became assistant pastor there; but in the autumn of 1633 he returned to Salem as assistant pastor, succeeding in the following year as sole pastor. Chiefly on account of his pronounced opinions regarding the restricted sphere of the civil magistrates in religious matters, he came into conflict with the court of Massachusetts, and, being banished from the colony, left with a few sympathizers in January, 1636, for Narragansett Bay. At first they received a grant of land from an Indian chief, which is now included in Seekonk, Massachusetts, and began to build houses, but in June following he and five others embarked in a canoe for Rhode Island, and founded a settlement to which Williams, in remembrance "of God's providence to him in his distress," gave the name of Providence. In 1639 he was publicly immersed and became pastor of the first Baptist church of Providence.[1] As Massachusetts now began to claim jurisdiction over Narragansett Bay, Williams proceeded in June, 1643, to England, and through the mediation of his friend Sir Henry Vane, whose acquaintance he had made at Massachusetts, obtained an independent charter, 14th March, 1644. In 1649 he was chosen deputy president. He again visited England in 1651 to obtain a more explicit charter, and remained there till 1654, enjoying the friendship of Milton, Cromwell, and other prominent Puritans. On his return to the colony in 1654 he was chosen president or governor, and remained in office till 1658. He lived to the age of eighty-four, but the exact date of his death is uncertain.

Williams was the author of a *Key into the Language of the Indians of America* (written at sea on his first voyage to England; London, 1643, reprinted in vol. i. of *Collections* of Rhode Island Historical Society, 1827); *Mr. Cotton's Letter Examined and Answered*, 1644; *The Bloody Tenent of Persecution for the Cause of Conscience*, 1644; *Queries of Highest Consideration*, 1644; *The Bloody Tenent yet More Bloody*, 1652; *The Hireling Ministry None of Christ's*, 1652; *Experiments of Spiritual Life and Health*, 1652; and *George Fox Digged out of his Burrows*, 1676. A complete collection of all his letters that have been recovered forms vol. vi. of the *Publications* of the Narragansett Club. See *Lives* by Knowles (1833), Gammell (1846), and Elton (1852); Sparks's *Library of American Biography;* Savage's *Genealogical Dictionary of New England Settlers; Biographical Cyclopedia of Representative Men of Rhode Island*, 1883; Guild's *Account of the Writings of Roger Williams*, 1862; and Dexter's *As to Roger Williams and his Banishment from Massachusetts Bay*, 1876.—[See also Guild's *Footsteps of Roger Williams* (1886).—AM. ED.]

WILLIAMSPORT, a city of the United States, the county seat of Lycoming county, Pennsylvania, is situated in the valley of the west branch of the Susquehanna river, amid the hills of the Allegheny plateau, and is entered by four railway lines,—the Northern Central, the Philadelphia and Erie, the Philadelphia and Reading, and the Corning, Cowanesque, and Antrim. The city is somewhat irregularly laid out, and the streets are mainly unpaved. The population in 1880 was 18,934; in 1870 it was 16,030. Williamsport owes its importance chiefly to its large lumber industry. The healthfulness of its climate and the beauty of the surrounding scenery have made it a popular summer resort in recent years.

WILLIBRORD, ST., the apostle of the Frisians, was born about 657. His father, Wilgils, an Angle or, as Alcuin styles him, a Saxon, of Northumbria, withdrew from the world and constructed for himself a little oratory dedicated to St. Andrew. The king and nobles of the district endowed him with estates till he was at last able to build a church, over which Alcuin afterwards ruled. Willibrord, almost as soon as he was weaned, was sent to be brought up at Ripon, where he must doubtless have come under the influence of Wilfrid. About the age of twenty the desire of increasing his stock of knowledge (*c.* 679) drew him to Ireland, which had so long been the headquarters of learning in western Europe. Here he stayed for twelve years, enjoying the society of Egbert and Wictbert, from the former of whom he doubtless received his first impulse to missionary work among the North-German tribes. In his thirty-third year (*c.* 690) he started with twelve companions for the mouth of the Rhine. These districts were then occupied by the Frisians under their king Rabbod or Radbod. After a time he found in Pippin, the mayor of the palace, a strong supporter, who sent him to Rome, where he was consecrated bishop by Pope Sergius on St. Cecilia's Day, 696. Bede says that when he returned to Frisia his see was fixed in Utrecht. He now seems to have spent several years in founding churches and the work of conversion, till his success tempted him to pass into those parts of the land which did not own the Frankish sway. Being kindly received by Radbod, but failing to convert him, he passed on to Denmark, whence he carried away thirty boys to be brought up among the Franks. On his return he was wrecked on the holy island of Foside (Heligoland), where his disregard of the pagan superstition nearly cost him his life. When Pippin died, Willibrord found a supporter in his son Charles Martel, who, according to Alcuin's version of the story, established the bishop in Utrecht upon Radbod's death (719). At this time he was assisted for three years in his missionary work by St. Boniface (719–722). Of the later years of his life we have no special chronological details. He passed throughout his diocese on horseback, working petty miracles and prophetically anticipating the future glory of Charles's son Pippin at his baptism. He was still living when Bede wrote in 731. A passage in one of Boniface's letters to Stephen III. speaks of his preaching to the Frisians for fifty years, apparently reckoning from the time of his consecration. This would fix the date of his death in 738; and, as Alcuin tells us he was eighty-one years old when he died, it may be inferred that he was born in 657,—a theory on which all the dates given above are based, though it must be added that they are substantially confirmed by the incidental notices of Bede. The day of his death was 6th November, and his body was buried in the monastery of Epternac, which he had himself founded. Even in Alcuin's time miracles were reported to be still wrought at his tomb.

---

[1] [He was immersed by a layman, Ezekiel Holliman, and in turn administered the same rite to him and a few others. From the church thus formed Williams withdrew a few months later and remained thereafter a "Seeker" or undenominational disciple.—AM. ED.]

The chief authorities for Willibrord's life are Alcuin's *Vita Willibrordi*, both in prose and in verse, and Bede's *Hist. Eccl.*, v. cc. 9–11. See also Eddius's *Vita Wilfridii.*

WILLIMANTIC, a borough in the township of Windham, Windham county, Connecticut, United States, is situated in a broken hilly country, on a river of the same name and on three railway lines,—the New York and New England, the New York, New Haven, and Hartford, and the Central Vermont. The population in 1880 was 6608. The industries consist chiefly of cotton manufactures, in which the town has acquired great prominence, owing to the fine water power afforded by the Willimantic river.

WILLIS, Nathaniel Parker[1] (1806–1867), American author, was descended from George Willis, described as a "Puritan of considerable distinction," who arrived in New England about 1630 and settled in Cambridge, Mass. Nathaniel Parker was the eldest son and second child of Nathaniel Willis, a newspaper proprietor in Boston, and was born in Portland, Maine, 20th January, 1806. After attending Boston Latin school and the academy at Andover, he entered Yale College in October, 1823. Although he did not specially distinguish himself as a student, university life had considerable influence in the development of his character, and furnished him with much of his literary material. Immediately after leaving Yale he published in 1827 a volume of *Poetical Sketches*, which attracted some attention, although the critics found in his verses more to blame than to praise. It was followed by *Fugitive Poetry*, (1829) and *Poems* (1831). He also contributed frequently to magazines and periodicals. In 1829 he started the *American Monthly Magazine*, which was continued from April of that year to August, 1831, but failed to achieve success. On its discontinuance he went to Europe as foreign editor and correspondent of the *New York Mirror*. To this journal he contributed a series of letters, which, under the title *Pencillings by the Way*, were published at London 1835 (3 vols.; Philadelphia, 1836, 2 vols.; and first complete edition, New York, 1844). Their vivid and rapid sketches of scenes and modes of life in the Old World at once gained them a wide popularity; but he was censured by some critics for indiscretion in reporting conversations in private gatherings. Notwithstanding, however, the small affectations and fopperies which were his besetting weaknesses as a man as well as an author, the grace, ease, and artistic finish of his style won general recognition. His *Slingsby Papers*, containing descriptions of American life and adventure, republished in 1836 under the title *Inklings of Adventure*, were as successful in England as were his *Pencillings by the Way* in America. He also published while in England *Melanie and other Poems* (London, 1835; New York 1837), which was introduced by a preface by Barry Cornwall. After his marriage to Mary Stace, daughter of General Stace of Woolwich, he returned to America, and settled at a small estate[2] on Owego Creek, just above its junction with the Susquehanna. Here he lived off and on from 1837 to 1842 and wrote *Letters from Under a Bridge* (1840),[3] the most charming of all his works. During a short visit to England in 1839–40 he published *Two Ways of Dying for a Husband*. Returning to New York, he established, along with George P. Morris, a newspaper entitled the *Evening Mirror*. On the death of his wife in 1845 he again visited England. Returning to America in the spring of 1846, he again married, and established the *National Press*, afterwards named the *Home Journal*. In 1845 he published *Dashes at Life*, in 1846 a collected edition of his *Prose and Poetical Works*, in 1849 *Rural Letters*, and in 1850 *Life Here and There*. In the last-mentioned year he settled at Idlewild, and on account of failing health spent the remainder of his life chiefly in retirement. Among his later works were *Hurrygraphs*, 1851; *Outdoors at Idlewild*, 1854; *Ragbag*, 1855; *Paul Fane*, 1856; and the *Convalescent*, 1859. He died 20th January, 1867, and was buried in Mount Auburn, Boston.

His *Poems*, with memoir, appeared in 1867, an English edition of his *Poems* in 1868, and a *Selection from his Prose Writings*, edited by Henry A. Beers, New York, 1885. His *Life*, by Henry A. Beers, appeared in the series of *American Men of Letters* the same year.

WILLIS, Thomas (1621–1675), English physician, was born at Great Bedwin, Wiltshire, on 27th January, 1621. He studied at Christ Church, Oxford; and when that city was garrisoned for the king he bore arms for the Royalists. He took the degree of bachelor of medicine in 1646, and after the surrender of the garrison applied himself to the practice of his profession. In 1660, shortly after the Restoration, he became Sedleian professor of natural philosophy in place of Dr. Joshua Cross, who was ejected, and the same year he took the degree of doctor of physic. In 1664 he discovered the medicinal spring at Astrop, near Brackley in Northamptonshire. He was one of the first members of the Royal Society, and was elected an honorary fellow of the Royal College of Physicians in 1664. In 1666, after the fire of London, he removed to Westminster, on the invitation of Dr. Sheldon, archbishop of Canterbury. There he rapidly acquired an extensive practice, his reputation and skill marking him out as one of the first physicians of his time. He died at St. Martin's on 11th November, 1675, and was buried in Westminster Abbey.

---

[1] [See Appendix for additional details.—Am. Ed.]

[2] Called Glenmary after his wife.

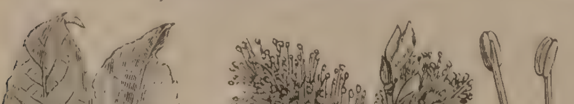
[3] [Collected from the *Mirror* and published in a vol. entitled *À l'Abri, or the Tent Pitched.*—Am. Ed.]

Willis was admired for his piety and charity, for his deep insight into natural and experimental philosophy, anatomy and chemistry, and for the elegance and purity of his Latin style. He wrote in English *A Plain and Easy Method for Preserving those that are Well from the Infection of the Plague, and for Curing such as are Infected.* His Latin works were printed in two vols. 4to at Geneva in 1676, and at Amsterdam in 1682. His grandson, Browne Willis, was the author of several antiquarian works.

See Munk, *Roll of the Royal College of Physicians, London* (2d ed., vol. i., London, 1878).

WILLMORE, James Tibbitts (1800–1863), English line engraver, was born at Bristnall's End, Handsworth, near Birmingham, on 15th September, 1800. At the age of fourteen he was apprenticed to William Radcliffe, a Birmingham engraver, and in 1823 he went to London and was employed for three years by Charles Heath. He was afterwards engaged upon the plates of Brockedon's *Passes of the Alps* and Turner's *England and Wales.* He engraved after Chalon, Leitch, Stanfield, Landseer, Eastlake, Creswick, and Ansdell, and especially after Turner, from whose Alnwick Castle by Moonlight, the Old Téméraire, Mercury and Argus, Ancient Rome, and the subjects of the Rivers of France he executed many admirable plates. He was elected an associate engraver of the Royal Academy in 1843. He died on 12th March, 1863.

WILLOW (*Salix*), a very well marked genus of plants constituting, with the Poplar (*Populus*), the order *Salicaceæ.* Willows are trees or shrubs, varying in stature from a few inches to a hundred feet, and occurring most abundantly in cold or temperate climates in both hemispheres, and generally in moist situations. They are not unrepresented in the tropics, but have hitherto not been discovered in Australia or the South Sea Islands. Their leaves are deciduous, alternate, simple, generally much more long than broad, whence the term willow-leaved has become proverbial. At their base they are provided with stipules, which are also modified to form the scales investing the winter buds. The flowers are borne in catkins or amenta, which are on one tree male only, on another female. Each male flower consists of a small scale or bract, in whose axil are usually two, sometimes three, rarely five stamens, and still more rarely a larger number. In addition there is a small glandular disk, which assumes different shapes in different species. The female flowers are equally simple, consisting of a bract, from whose axil arises usually a very short stalk, surmounted by two carpels adherent one to the other for their whole length, except that the upper ends of the styles are separated into two stigmas. When ripe the two carpels separate in the form of two valves and liberate a large number of seeds, each provided at the base with a tuft of silky hairs, and containing a straight embryo without any investing perisperm or albumen. Fertilization is effected by insects, especially by bees, which are directed in their search by the color and fragrance of the flowers. Some pollen must also be transported by the wind to the female flowers. The tuft of hairs at the base of the seed doubtless facilitates rapid dispersion of the seed, early germination of which is rendered desirable owing to its tenuity and the absence of any perisperm. Although the limitations of the genus are well marked, and its recognition in consequence easy, it is otherwise with regard to the species. The greatest difference of opinion exists among botanists as to their number and the bounds to be assigned to each. The cross-fertilization that takes place between the species of course intensifies the difficulty. Andersson, a Swede, spent nearly a quarter of a century in their investigation, and ultimately published a monograph which is the standard authority on the subject. He admits about a hundred species. Some botanists have enumerated eighty species from Great Britain alone, while others count only a dozen or fifteen. To illustrate the great perplexity surrounding the subject, we may mention that to one species, *S. nigricans*, one hundred and twenty synonyms have been attached. Some of these are doubtless such as no botanist, with adequate material for forming an opinion, would accept; but, after making the necessary deductions for actual mistakes and misstatements, there still remains a large number upon which legitimate differences of opinion prevail. Andersson says that he has rarely seen two specimens of this species which were alike in the collective characters offered by the stature, foliage, and catkins. No better example could be found of the almost limitless variation in so-called species, so that the attempt to define the indefinable can at best result only in an arbitrary grouping.



Willow. (1) Leaf shoot; (2) male catkin; (3) male flower; (4) female catkin; (5) female flower; (6) capsule, opened; (7) seed.

Few genera have greater claims to notice from an economic point of view. As timber trees many of the species are valuable from their rapidity of growth and for the production of light durable wood, serviceable for many purposes. Among the best trees of this kind are *S. fragilis*, especially the variety known as *S. fragilis*, var. *Russelliana*, and *S. alba*, the white or Huntingdon willow. These trees are usually found growing by rivers' banks or in other moist situations, and are generally pollarded for the purpose of securing a crop of straight poles. This plan is, however, objectionable, as inducing decay in the centre of the trunk. Where poles are required, it is better to treat the trees as coppice and to cut the trunk level with the soil. *S. Capræa*, a hedgerow tree, generally grows in drier situations. It is a useful timber tree, and its wood, like that of *S. alba*, is prized in the manufacture of charcoal. Its catkins are collected in England in celebration of Palm Sunday, the gayly-colored flowers being available in early spring when other decorations of the kind are scarce. Certain sorts of willow are largely used for basket-making and wicker-work. The species employed for this purpose are mostly of shrubby habit, and are known under the collective name of osiers. The best for planting, according to Mr. Scaling, is the bitter osier, *S. purpurea*; planted on rich, well-drained soil, subject to occasional immersion, this willow may be grown profitably for basket-work. It is also well adapted for forming wind-breaks or screens, or for holding the banks of streams and preventing the removal of the soil by the current. *S. viminalis* is one of the best of the green osiers, suitable for hoops and valuable for retaining the soil on sloping embankments. *S. vitellina* yields the yellow osiers. Osiers are largely imported into England from Belgium and France, but might with advantage be much more abundantly grown in the United Kingdom than they are. They are easily propagated by truncheons or cuttings, inserted in a slanting direction into the soil for a depth of 8 to 10 inches. Mr. Scaling recommends that they be planted 18 inches apart, thus employing about 20,000 cuttings per acre, the whole cost of planting being estimated at £25 [$121.50] the acre. A crop is obtained the third year after planting, and one may be expected annually for the succeeding ten years. The average yield is cited at 6 to 7½ tons, ranging in price from £2, 10s. [$12.15] to £3, 10s. [$17.01] a ton (unpeeled). Land unsuitable for root or grain crops can be utilized for the growth of osiers; but, as in the case of all other plants, good cultivation, including the selection of sorts appropriate to the locality, drainage, manure, etc., ensures the best return. *S. acuminata* and other species do well by the seaside, and are serviceable as wind-screens, nurse-trees and hedges. *S. daphnoides*, *S. repens*, and other dwarf kinds are useful for binding heathy or sandy soil. In addition to their use for timber or basket-making, willows contain a large quantity of tannin in their bark. A bitter principle named SALICIN (*q.v.*) is also extracted from the bark. As ornamental trees some willows also take a high rank. The white willow is a great favorite, while the drooping habit of the weeping willow renders it very attractive. Though named *S. babylonica*, it is really a native of China, the willow of the Euphrates (Ps. cxxxvii.) being in all probability *Populus euphratica*. *S. babylonica* is sometimes spoken of as Pope's willow, having been cultivated by that poet, or as Napoleon's willow, because his tomb at St. Helena is overshadowed by a tree of this species, from which many offsets exist or are reputed to exist in modern gardens. *S. regalis* has very white, silvery leaves. *S. rosmarinifolia* is remarkable for its very narrow leaves,—purplish above, silvery beneath.

WILLUGHBY, FRANCIS (1635–1672), English ornithologist and ichthyologist, who is memorable as the pupil, friend, and patron as well as the active and original co-worker of John RAY (*q.v.*), and hence to be reckoned as one of the most important precursors of Linnæus. He was the son of Sir Francis Willughby, and was born in 1635. His connection with Ray dated from his studies at Cambridge (1653–59); and, after concluding his academic life by a brief sojourn at Oxford, and acquiring considerable experience of travel in England, he made an extensive Continental tour in his company. The specimens, figures, and notes thus accumulated were in great part elaborated on his return into his *Ornithologia*, which, however, he did not live to publish, having injured a naturally delicate constitution by alternate exposure and over-study. This work was published in 1676, and translated by Ray as the *Ornithology of Fr. Willughby* (London, 1678, fol.); the same friend published his *Historia Piscium* (1686, fol.). Willughby died on 3d July, 1672.

In Ray's preface to the former work he gives Willughby much of the credit usually assigned to himself, both as critic and systematist. Thus, while founding on Gesner and Aldrovandus, he omitted their irrelevancies, being careful to exclude "hieroglyphics, emblems, morals, fables, presages, or ought else pertaining to divinity, ethics, grammar or any sort of humane learning, and present him [the reader] with what properly belongs only to natural history." Again, he not only devised artificial keys to his species and genera, but, "that he might clear up all these obscurities [of former writers] and render the knowledge and distinction of species facile to all that should come after, he bent his endeavors mainly to find out certain characteristic notes of each kind," while finally, in apologizing for his engravings, he yet not unjustly claims that "they are best and truest of any hitherto graven in brass." See further ORNITHOLOGY, vol. xviii. p. 2.

WILMINGTON, the largest city of the State of Delaware, United States, and the port of entry in New Castle county, is situated between Brandywine and Christiana creeks and near the Delaware river. The site is low, but with sufficient slope to afford suitable drainage. The surrounding country is level and fertile, and is devoted mainly to agriculture and manufactures. Wilmington is a railway centre of considerable importance, being entered by the Philadelphia, Wilmington and Baltimore, the Baltimore and Ohio, and the Wilmington and Northern Railways. The Brandywine and Christiana creeks are navigable for vessels of light draught, and the Delaware can float vessels of the largest size and affords ample harbor accommodation. The city is laid out quite regularly. The population which in 1870 was 30,841, in 1880 was 42,478. The manufactures in 1880 gave occupation to 7852 persons, the principal branches being the manufacture of paper and of iron and steel, shipbuilding, and wagon and carriage making.[1] The trade of the city is inconsiderable.

Wilmington was settled by Swedes in 1638. The settlement was conquered by the Dutch, who in turn handed it over to the English. It was chartered as a city in 1832, and since the middle of the century has grown rapidly.

WILMINGTON, the county seat of New Hanover county, North Carolina, United States, the principal seaport and the largest city of the State, is situated on the east bank of Cape Fear river, 30 miles from the ocean. It has railroad communication to the north, south, and west, and this, together with its maritime position, makes it an important shipping point. The principal objects of trade are lumber (southern pine), naval stores, and cotton. The value of its exports by sea exceeds $4,000,000 annually. The city, which is in the main regularly laid out, had in 1870 a population of 13,446, and in 1880 of 17,350, of whom 60 per cent. were Negroes.

The site of Wilmington was originally occupied by a town named Newton, laid out in 1733. The name was changed to Wilmington six years later. The place was incorporated as a city in 1866. During the Civil War it was the principal port of entry for the Confederate blockade runners.

WILMOT, JOHN. See ROCHESTER, EARL OF.

WILNO. See VILNA.

WILSON, ALEXANDER (1766–1813), "the American ornithologist," was born in Paisley, Scotland, on 6th July, 1766. His father, a handloom weaver, soon removed to the country, and there combined weaving with agriculture, distilling, and smuggling,—conditions which no doubt helped to develop in the boy that love of rural pursuits and adventure which was to determine his career. At first he was placed with a tutor and destined for the church; but his father's circumstances soon compelled him to apprentice the boy to his own trade. The lad's real life, however, was spent in reverie and versification, and in long woodland rambles, in the course of which he combined his poetic musings with the keen observation of a naturalist, supplemented by the woodcraft of an accomplished poacher. As these tastes developed, he decided to exchange the loom for the peddler's pack, and then spent a year or two in travelling through Scotland, recording in his journal every matter of natural history or antiquarian interest, like another Sibbald or White of Selborne. Having incurred a short imprisonment for lampooning the master-weavers in a trade dispute, he emigrated to America in 1794. After a few years of weaving, peddling, and desultory observation, he became a village schoolmaster, and in 1800 obtained an appointment near Philadelphia, where he formed the acquaintance of Bartram the naturalist, from whom he received much instruction and encouragement. Under his influence Wilson commenced to draw birds, having conceived the idea of illustrating the ornithology of the United States; and thenceforward he steadily accumulated materials and made many expeditions. In 1806 he obtained the assistant-editorship of *Rees's Encyclopædia*, and thus acquired more means and leisure for his great work, the first volume of which appeared in the autumn of 1808, after which he spent the winter in a journey "in search of birds and subscribers." By the spring of 1813, seven volumes had appeared; but the arduous expedition of that summer, in search of the marine waterfowl to which the remaining volume was to be devoted, gave a shock to his already impaired health, and soon after he succumbed to dysentery after a short illness, dying at Philadelphia on 23d August, 1813.

---

[1] [The Dupont powder mills are near the city.—AM. ED.]

Of his poems, not excepting the *Foresters* (Philadelphia, 1805), nothing need now be said, save that they no doubt served to develop his descriptive powers. His *American Ornithology*, however, remains a fundamental classic. In the words of Jardine, "He was the first who studied the birds of North America in their natural abodes and from real observation; and his work will remain an ever to be admired testimony of enthusiasm and perseverance, one certainly unrivalled in description; and, if some plates and illustrations may vie with it in finer workmanship or pictorial splendor, few indeed can rival it in fidelity and truth of delineation." The eighth and ninth volumes were edited after his decease by his friend Ord, and the work was continued by Lucien Bonaparte (4 vols., Philadelphia, 1828–33). The *American Ornithology* was also republished by Sir William Jardine (3 vols., London, 1832), and an edition of his entire works has been edited by Rev. A. B. Grosart (Paisley, 1876). A statue was also erected to him at Paisley, in 1876.

WILSON, FLORENCE. See VOLUSENUS.

WILSON, HENRY (1812–1875), vice-president of the United States from 1873 to 1875, was born at Farmington, N. H., on 16th February, 1812. His proper name was Jeremiah J. Colbath. His parents were day-laborers and very poor. At ten years of age he went to work as a farm-laborer. The boy was greedy for reading, and before the end of his apprenticeship had read more than a thousand volumes. At the age of twenty-one, for some unstated reason, he had his name changed by Act of the Legislature to that of Henry Wilson. Walking to Natick, Mass., he learned the trade of shoemaker, and by it supported himself through the Concord academy. After successfully establishing himself as a shoe manufacturer, he became a noted public speaker in support of Harrison during the presidential election of 1840. For the next ten years he was regularly returned to the State legislature. In 1848 he left the Whig party and became a "Free Soiler." The Free Soil party nominated him for governor of the State in 1853, but he was defeated. In 1855 he was sent to the United States Senate by the Free Soil and Democratic parties, and remained there by reelections until 1873. When the Civil War broke out he found a severe test awaiting him. He had been deeply interested from 1840 until 1850 in the militia of his State, and had risen through its grades of service to that of brigadier-general. He was now made chairman of the military committee, and in this position performed most laborious and important work for the four years of the war. The position offered boundless and safe opportunities for becoming wealthy. But so far was Wilson from using them that he died poor, owing to his necessary neglect of his private affairs. Sumner says that in 1873 Wilson was obliged to borrow a hundred dollars from him to meet the expenses of his inauguration as vice-president. The Republicans nominated Wilson for the vice-presidency in 1872, and he was elected; but he died, before completing his term of service, at Washington, on 22d November, 1875. He left two small but useful works, *Anti-Slavery Measures in Congress* (Boston, 1864) and *Military Measures of Congress* (Hartford, 1868), and a larger work in three volumes, *The Rise and Fall of the Slave Power in America* (Boston, 1871–76). His *Life* has been written by E. Nason and by J. B. Mann.

WILSON, HORACE HAYMAN (1786–1860), one of the most distinguished Orientalists of England, was born in London on 26th September, 1786. He was educated for the medical profession, and on completing his studies went out to India in 1808 as an assistant-surgeon on the Bengal establishment of the East India Company. Instead of entering the regular medical service, however, his knowledge of chemistry and the practical analysis of metals caused him to be attached to the mint at Calcutta, where he was for a time associated with John Leyden, the Scottish poet and Orientalist. It was not long before he himself became deeply interested in the ancient language and literature of India, and attracted the attention of Henry T. Colebrooke, the famous Sanskrit scholar, on whose recommendation he was in 1811 appointed secretary to the Asiatic Society of Bengal. In 1813 he published the Sanskrit text—with a graceful, if somewhat free, translation in English rhymed verse—of Kālidāsa's charming lyrical poem, the *Meghadūta*, or *Cloud Messenger* (2d ed. 1843, 3d ed. 1867). He then undertook the arduous task of preparing the first *Sanskrit-English Dictionary* from materials compiled by native scholars for the college of Fort William, supplemented by his own researches. The work appeared in 1819, prefaced with an excellent general survey of Sanskrit lexicology. A second, much enlarged edition, but without the introduction, was published in 1832, and has recently been reprinted at Calcutta. The appearance of the *Dictionary* at once placed Wilson in the first rank of Sanskrit scholars; and, while patiently pursuing his study of the writings and institutions of ancient India, he became one of the most valuable contributors to the *Asiatic Researches* and the *Calcutta Quarterly*. Among his more important contributions to these journals may be mentioned essays on the "Medical and Surgical Sciences of the Hindus" (1823); the "Hindu History of Kashmir" (1824); "Hindu Fiction" (1825); and his masterly "Account of the Religious Sects of the Hindus, their History, Doctrines, and Practices" (1828–32). In 1827 he published *Select Specimens of the Theatre of the Hindus*, in 3 vols., in which, besides a very full and highly appreciative survey of Indian dramaturgy, which still remains the standard authority on the subject, he offered elegant translations of six complete plays and short accounts of twenty-three others. This work was reprinted in London in 1835, in 2 vols., and again in Wilson's *Collected Works* (vols. xi. and xii.). Of considerable importance, alike to Sanskrit and vernacular students, and to Eastern antiquarians generally, was his next publication, the *Mackenzie Collection* (2 vols., 1828; 2d ed. in one vol., 1882), being a descriptive catalogue of the extensive collection of Oriental, especially South Indian, MSS. and antiquities made by Col. Colin Mackenzie, and purchased from his widow by the Indian Government, now deposited partly in the India Office, London, and partly at Madras. Neither his extensive literary researches, however, nor the official duties of an assay master and mint secretary, at any time prevented Wilson from taking a prominent part in all social amusements of the Anglo-Indian community of Calcutta, especially in musical and theatrical entertainments. His interest in political and economic affairs in India is shown by his *Historical Sketch of the First Burmese War, with Documents, Political and Geographical* (1827, reprinted in London), and his *Review of the External Commerce of Bengal from* 1813 *to* 1828 (1830), as well as by his *History of British India from* 1805 *to* 1835, in continuation of Mill's *History*, 3 vols. (1844–48), and largely based on his personal impressions and recollections. He also acted for many years as secretary to the committee of public instruction. As such, he not only organized and superintended the studies of the Hindu College from the time of its establishment, but took a leading part in the promotion of public education among the natives, and the introduction of the English language and European science, although, as one of the stanchest opponents, on grounds of expediency and feasibleness, of the proposal that English should be made the sole medium of instruction in native schools, he became for a time the object of bitter attacks. Long, however, before this controversy came to an end he had been called away to a different sphere of scholarly activity. In 1832 the University of Oxford, in recognition of his services to Oriental scholarship, selected Dr. Wilson to be the first occupant of the newly founded Boden chair of Sanskrit. Shortly after his return to England he was also appointed librarian to the East India Company. He now found himself in a position singularly favorable to learned research and literary pursuits; and the long record of his subsequent work shows that he made the best of his opportunities. He immediately joined the Royal Asiatic Society, and, succeeding Colebrooke as director (in 1837), he was the very soul of the society up to the time of his death, scarcely a number of its journal appearing without some interesting contribution from his pen. His death took place at London on 8th May, 1860.

Of these contributions we need only mention here his "Historical Sketch of the Kingdom of Pāndya" (1836), based on documents contained in the Mackenzie collection; the continuation of his "Analysis of the Purānas" (1836), begun in the *Bengal Society's Journal* (1832); "Civil and Religious Institutions of the Sikhs" and "Religious Festivals of the Hindus" (1848); "Analysis and Revised Translation of the Rock Inscriptions of Kapur di Giri" (1850); and his popular lecture "On the Present State of the Cultivation of Oriental Literature" (1852). Hardly less numerous, and certainly not less valuable, are his separate publications during this period, by which important light was thrown on many departments of Eastern inquiry. The most noteworthy of these works are the text of, and commentary on, the Sānkhyakārikā (1837), being a very popular summary of the Sānkhya philosophy, with a translation (of the text by Colebrooke, and the commentary by Wilson); translation of the *Vishnu Purāna* (1840, 2d annotated ed. by F. E. Hall; *Works*, vols. vi.–x.); *Ariana Antiqua, Antiquities and Coins of Afghanistan* (1841); edition of *Dasakumāracharita* (1846); *Glossary of Indian Revenue, Judicial, etc., Terms* (1855); *Translation of the First Four Ashtakas* (rather more than one-half) *of the Sacred Hymns of the Rigveda*, 3 vols., 1850–57; *Grammar of the Sanskrit Language*, in several editions; and two lectures on the *Religious Practices and Opinions of the Hindus*, delivered at Oxford in 1840. In the *Collected Works* (12 vols.) the more valuable of his papers and lectures form three volumes of essays on *Sanskrit Literature* and two volumes of essays on *The Religion of the Hindus*, edited by Dr. R. Rost. While in point of accurate scholarship Wilson was perhaps scarcely the equal of Colebrooke, any deficiency in this respect is far more than counterbalanced by the many-sidedness of his genius, by literary powers of a very high order, by his admirable artistic taste, and by broad human sympathies, which enabled him fully to appreciate and enjoy the merits and beauties of the ancient Indian literature. A considerable number of Sanskrit MSS. (540 vols.) collected by Wilson in India are now in the Bodleian.

WILSON, JOHN (1785–1854), beter known as CHRISTOPHER NORTH (the pen-name which he used in his contributions to *Blackwood's Magazine*), was born at Paisley on 18th May, 1785. His father, who bore the same name with himself, was a wealthy gauze manufacturer of no particular family or education. His mother, Margaret Sym, was of gentler blood, possessing also beauty and talents. John was the fourth child, but the eldest son, and he had nine brothers and sisters.[1] He appears, like many Scotchmen of genius, to have been rather irregularly educated in his earlier days,—the best of his physical and sporting, if not of his scholastic, training being received at the manse of the village of Mearns, of which constant notices appear in the *Essays*. He was only twelve when he was first entered at the university of Glasgow, and he continued to attend various classes in that university for six years, being for the most part domiciled with and under the tutorship of Prof. Jardine. His father's death had immediately preceded his first entry at Glasgow. In these six years Wilson "made himself" in all ways, acquiring not inconsiderable scholarship, perfecting himself in all sports and exercises, and falling in love with a certain "Margaret," who was the object of his affections for several years. The most curious literary memorial of these early years is a letter to Wordsworth, written in 1802 without any personal acquaintance or introduction, and betraying not a little priggishness, as we should now count it, but in that respect only showing the difference of contemporary manners, and interesting as being the first evidence of what was nearly a lifelong connection of admiring though sometimes recalcitrant criticism.

In June, 1803, Wilson was entered as a gentleman commoner at Magdalen College, Oxford. Men have seldom felt more than Wilson the charm which Oxford exercises on all but a very few, and generally (with some noteworthy exceptions, such as Gibbon and Jeffrey) very worthless, sons; and in much of his later work, notably in the essay called "Old North and Young North," he has expressed his feeling. But it does not appear that his Magdalen days were altogether happy, though he perfected himself in "bruising," pedestrianism, and other sports, and read so as to obtain a brilliant first class. His love affairs with "Margaret" did not go happily, and he seems to have made no intimate friends at his own college and few in the university. He took his degree in 1807 and found himself at twenty-two his own master; and he had a good income, no father or guardian to control him, no property requiring management, and apparently was not under the influence of the etiquette which in similar circumstances generally makes it necessary for a young man to adopt some profession, if only in name. His profession was an estate on Windermere called Elleray, and ever since imperishably connected with his name. Here he built, boated, wrestled, shot, fished, walked (he was always an astonishing pedestrian), and otherwise diverted himself for four years, besides composing or collecting from previous compositions a considerable volume of poems. But Wilson was too genuine a man to be happy without a wife, and in 1810 the place of "Margaret" was taken by Jane Penny, a Liverpool girl of some family and fortune, whom he married on 11th May, 1811. *The Isle of Palms*, his first published volume, consisting of poems, was issued not long after this. Four years of married life at Elleray succeeded, which, except as being happier and therefore less historied, do not seem to have differed much from the earlier four. Then came the event which definitely made a working man of letters of Wilson, and without which he would probably have produced a few volumes of verse and nothing more. His whole fortune, or at least the major part of it, was lost by the dishonest speculation of an uncle in whose hands, with no doubt rather culpable carelessness, Wilson had left it. At the same time this hard fate was by no means unqualified in its hardness. His mother had a house in Edinburgh, in which she was able and willing to receive her son and his family; nor had he even to give up Elleray, though henceforward he was not able constantly to reside in it. He read law and was called to the Scotch bar, taking plentiful sporting and pedestrian excursions, on some of which his wife accompanied him, publishing in 1816 a second volume of poems (*The City of the Plague*), and generally leading a very pleasant life, if not such an entirely independent one as formerly. The year 1817 was the turning point in Wilson's life. The famous Cevallos article, which resulted in the secession of Scott and other Tories from the *Edinburgh Review* and the establishment of the *Quarterly*, was years earlier; but there had still been no formal declaration that the "Blue and Yellow" was for Whigs only. Wilson was a Tory and the son of Tories ("If you turn Whig, John," said his mother to him, "this house will not hold you and me"), but he was glad to accept Jeffrey's invitation to contribute. Almost at the same time, however, a far more suitable chance appeared. Wilson was not patient of being edited, and his reckless humor as well as his political bias would in the long run have pretty certainly disqualified him for the *Edinburgh*. The growth of *Blackwood's Magazine*, and its sudden transformation from a colorless or Whiggish monthly rival to Constable's *Review* into an organ at once of the most red-hot Toryism in politics and of the wildest irreverence towards received notions in literature and other matters, took place in the same year. The petard of the "Chaldee Manuscript," nominally due to Hogg, but with most of the gunpowder put in by Wilson and Lockhart, determined the character of the new periodical, and Wilson's career was fixed. He was never exactly editor, for the powers of "Christopher North" in that respect were a fantastic imagination; and we have definite and authoritative assertions, not only that he never received any stipend for editing, but that the publishers always retained a certain supervision even over Wilson's own contributions. The famous series of the *Noctes Ambrosianæ* is said to have been of Maginn's invention, and for nearly ten years was so very partially representative of Wilson's own work and thought that none of its numbers during that time have been included by his son-in-law in the authorized, but by no means complete, edition. Lockhart, a somewhat less genial but far more concentrated and deliberate writer, was, until his departure for London to take charge of the *Quarterly*, at least as potent in the management as Wilson; and, although the facts are not known with absolute certainty, there is no doubt that it was a daring "alarum and excursion" of Lockhart's, under the alias (one of many) of Baron von Lauerwinkel, which caused Jeffrey, nominally because of an attack on Prof. Playfair, but obviously for other reasons, to inform Wilson, almost in so many words, that his further contributions were not desired for the *Edinburgh*. Wilson had also some share—though, if internal evidence may be trusted, not much—in Lockhart's *Peter's Letters*, which harmless as they seem nowadays, infuriated the Whig society of the Scottish capital.

---

[1] The youngest brother was James Wilson "of Woodville" (1795–1856), who became a zoologist of some repute. He contributed to *Blackwood's Magazine* and to the *North British* and *Quarterly Reviews*, and wrote most of the articles on natural history ("Entomology," "Helminthology," "Mammalia," "Ornithology," "Reptiles," etc.) in the seventh edition of the *Encyclopædia Britannica*.

The first result of this new business on Wilson's general mode of life was that he left his mother's house and established himself (1819) in Ann Street, Edinburgh, on his own account with his wife and family of five children. The second was much more unlooked for: it was his candidature for and election to the chair of moral philosophy in the university of Edinburgh (1820). To speak honestly, his qualifications for the post were almost *nil*, even if the fact that the best qualified man in Great Britain, Sir William Hamilton, was also a candidate, be left out of the question. But, luckily for Wilson and for letters, the matter was made a political one; the Tories still had a majority in the town council; he was powerfully backed up by friends, Scott at their head; and his adversaries played into his hands by attacking, not his competence (which, as has been said, was very vulnerable), but his moral character, which was not open to any fair reproach. Yet he made a very excellent professor, never perhaps attaining to any great scientific knowledge in his subject or power of expounding it, but acting on generation after generation of students with a stimulating force that is far more valuable than the most exhaustive knowledge of a particular topic. His duties left him plenty of time for magazine work, and for many years his contributions to *Blackwood* were extraordinarily voluminous. Most of the best and best-known of them appeared between 1825 and 1835, that is, between the departure of Lockhart for London in the former year and the death of Blackwood the publisher and of Mrs. Wilson in the latter.

The domestic events of Wilson's life in the last thirty years of it may be very briefly told. He oscillated between Edinburgh and Elleray, with plentiful excursions and summer residences elsewhere, a sea trip on board the Experimental Squadron in the Channel during the summer of 1832, and a few other unimportant diversions. The death of his wife was an exceedingly severe blow to him, especially as it coincided very nearly with that of his friend Blackwood. For many years after it (though he never up to the date of his death gave up writing) his literary work was intermittent, and, with some exceptions, not up to the level of the earlier. Late in 1850 his health showed definite signs of breaking up; and in the next year a civil list pension of £300 [$1458] a year was conferred on him. He died at Edinburgh on 3d April, 1854.

But a very small part of Wilson's extensive work was published in a collected and generally accessible form during his lifetime, the chief and almost sole exceptions being the two volumes of poems above referred to, the *Lights and Shadows of Scottish Life* (prose tales and sketches), and the *Recreations of Christopher North*, a selection, mostly limited to sporting and descriptive pieces, of his magazine articles. These volumes, with a selected edition of the *Noctes Ambrosianæ* in four volumes, and of further essays, critical and imaginative, also in four volumes, were collected and reissued uniformly after his death by his son-in-law, Prof. Ferrier. The collection is very far from exhaustive; and, though it undoubtedly contains most of his best work and comparatively little that is not good, it has been complained, with some justice, that the characteristic, if rather immature, productions of his first eight years on *Blackwood* are almost entirely omitted, that the *Noctes* are given but in part, if in their best part, and that at least three long, important, and interesting series of papers, less desultory than is his wont, on "Spenser," on "British Critics," and the set called "Dies Boreales," have been left out altogether. Wilson's characteristics are, however, uniform enough, and the standard edition exhibits them sufficiently, if not exhaustively. His poems may be dismissed at once as little more than interesting. They would probably not have been written at all if he had not been a young man in the time of the full flood of influence of Coleridge, Wordsworth, Byron, and Scott. His prose tales have in some estimates stood higher, but will hardly survive the tests of universal criticism. It is as an essayist and critic of the most abounding geniality, if not genius, of great acuteness, of extraordinary eloquence, and of a fervid and manifold sympathy, in which he has hardly an equal, that "Christopher North" lives and will live. The *Noctes Ambrosianæ*, a series of convivial table-talk, giving occasion to wonderfully various digressions of criticism, description, and miscellaneous writing, have been of late years ranked far below their real value. From their origin it necessarily followed that there was much that is ephemeral, a certain amount that is purely local, and something that is purely trivial in them. But their dramatic force, their incessant flashes of happy thought and happy expression, their almost incomparable fulness of life, and their magnificent humor give them all but the highest place among genial and recreative literature. It is often thought, and sometimes said, that no one but a Scotchman can relish them—an utter mistake, against which it is desirable most energetically to testify in the name of lovers of them who have not a drop of Scottish blood in their veins. The same qualities, together with a greater share of purely literary and critical power (to the display of which the form of the *Noctes* was inimical), and of a sometimes abused but very admirable faculty of word-painting, appear in the miscellaneous essays. Wilson's defects lay in the directions of measure and of taste properly so called, that is to say, of the modification of capricious likes and dislikes by reason and principle. He is constantly exaggerated, boisterous, wanting in refinement. But these are the almost necessary defects of his qualities of enthusiasm, eloquence, and generous feeling. The well-known adaptation of phrase in which he not recanted but made up for numerous earlier attacks on Leigh Hunt, "the Animosities are mortal, but the Humanities live for ever," shows him as a writer at his very best, but not without a little characteristic touch of grandiosity and emphasis. As a literary critic, as a sportsman, as a lover of nature, and as a convivial humorist, he is not to be shown at equal advantage in miniature; but almost any volume of his miscellaneous works will exhibit him at full length in either capacity or in all.

The chief, if not the sole, authentic source of information for Wilson's life is the memoir by his daughter, Mrs. Gordon (Edinburgh, 1862). (G. SA.)

WILSON, Richard (1714–1782), English landscape painter, was born at Penegoes, Montgomeryshire, where his father was a clergyman, on 1st August, 1714. His early taste for art was observed by a relative of his mother, Sir George Wynne, who in 1729 sent him to London to study under Thomas Wright, a little-known portrait painter of the time, by whom he was instructed for six years. He then started on his own account, and was soon in a good practice. Among his commissions was a full-length of the prince of Wales and the duke of York, painted for their tutor, the bishop of Norwich. Examples of his portraits may be studied

in Greenwich Hospital, in the Garrick Club, and in various private collections. In 1749 Wilson visited Italy, where he spent six years. He had previously executed some landscapes, but it was now that the advice of Zuccarelli and Joseph Vernet decided him to adopt this department of art exclusively. He studied Claude and Poussin, but retained his own individuality, and produced some admirable views of Rome and the Campagna. In 1755 he returned to England, and became one of the first of English landscape painters. Niobe, one of his most powerful works, was exhibited at the Society of Artists in 1760. On the establishment of the Royal Academy in 1768 he was appointed one of the original members, and he was a regular contributor to its exhibitions till 1780. He frequently executed replicas of his more important subjects, repeating some of them several times; in the figures which he introduced in his landscapes he was occasionally assisted by Mortimer and Hayman. During his lifetime his landscapes were never widely popular; his temper was consequently embittered by neglect, and so impoverished was he that he was obliged to seclude himself in an obscure, half-furnished room in Tottenham Court Road, London. In 1776, however, he obtained the post of librarian to the Academy; and by the death of a brother he acquired a small property near Llanferras, Denbighshire, to which he retired to spend his last days, and where he died suddenly in May, 1782. After his death his fame increased, and in 1814 about seventy of his works were exhibited in the British Institution. The National Gallery, London, contains nine of his landscapes.

The works of Wilson are skilled and learned compositions rather than direct transcripts from nature. His landscapes are treated with great breadth, and with a power of generalization which occasionally led to a disregard of detail. They are full of classical feeling and poetic sentiment; they possess noble qualities of color, and of delicate silvern tone; and their handling is vigorous and easy, the work of a painter who was thoroughly master of his materials.

See *Studies and Designs by Richard Wilson, done at Rome in the year* 1752 (Oxford, 1811); T. Wright, *Some Account of the Life of Richard Wilson* (London, 1824); Thomas Hastings, *Etchings from the Works of Richard Wilson, with some Memoirs of his Life* (London, 1825). Many of Wilson's best works were reproduced by Woollett and other engravers of the time.

Plate XIV.

WILTS, a southwestern county of England, is bounded N.W. and N. by Gloucestershire, E. by Berks and Hants, S. by Hants and Dorset, and W. by Somerset. It is of an irregular oval form, its greatest length from north to south being 54 miles and its greatest breadth from east to west 37. The area is 866,677 acres, or about 1354 square miles.

Geology.

About two-thirds of the surface of Wilts is occupied by a great Chalk upland, embracing the greater part of the wild wooded tract of Cranborne Chase, the undulating elevation of Salisbury Plain, and the hilly district of the Marlborough Downs, with Savernake Forest. In some cases the Chalk rises into steep escarpments; and the scenery of the northwestern region, bordering on the lower ground, is varied and picturesque. A large portion of the Chalk region is over 600 feet above sea-level, and several summits have an elevation of over 900 feet, the highest being Inkpen Beacon (1011 feet) at the junction of Wilts, Hants, and Berks. Scattered over the surface of the northern downs are huge blocks of silicious Tertiary grits, called sarsen stones or gray wethers, which have been used in the formation of the Druidical circles of Stonehenge and Avebury. The underlying Greensand is exposed in the deep valleys of the Chalk, especially in the broad vale of Pewsey, separating the Marlborough Downs from Salisbury Plain. It also appears as a narrow fringe between the Chalk and Oolite formations on the north and west, and in Alfred's Tower near Stourton on the Somersetshire border reaches an elevation of 800 feet. Outliers of the London Clay cap some of the hills in the neighborhood of Great and Little Bedwin and Savernake Forest; and the clays and sands of the Woolwich and Reading beds appear in the southeastern extremity of the county. About a third of the surface of the county, to the northwest of the Chalk, including a portion of the White Horse Vale, consists mainly of Oolite limestones and clays resting chiefly on the Greensand. The Lower, Middle, and Upper varieties are all represented. At one time the fuller's earth of the Lower Oolite was dug for use in the cloth-mills. In the Coral Rag of the Middle Oolite a useful bed of iron is wrought near Westbury, the annual output of ore varying in value from £12,000 [$58,320] to £20,000 [$97,200]. The valuable Portland stone of the Upper Oolite is quarried for building purposes at Chilmark, Tisbury, and Swindon, and the famous Bath stone of the Great Oolite is obtained at Corsham and Box on the Somersetshire border. The Oolite yields a variety of interesting fossils: the pear encrinite (*Apiocrinites rotundus*) is found in the Bradford clay; many fine corals are obtained in the Coral Rag; and *Isastræa oblonga* is very plentiful at Tisbury.

Rivers.

One of the most charming features of Wilts is its rich and finely wooded valleys. The three principal rivers are the Kennet, the Lower or Bristol Avon, and the Southern or Christchurch Avon. The Kennet, rising in the Marlborough Downs, winds eastwards past Marlborough and Hungerford into Berkshire, to join the Thames at Reading. The Lower Avon, which rises in Gloucestershire, flows southwards by Malmesbury, Chippenham, Melksham, and Bradford, where it bends northwestwards into Somersetshire. Besides several smaller streams, it receives from the south the Frome, which forms for a short distance the boundary between Wilts and Somersetshire. The Southern Avon, which rises near Bishop's Cannings in the centre of the county, flows southwards by Amesbury and Salisbury into Hants. At Salisbury it receives from the west the Nadder, after its junction with the Wily at Wilton, and from the northeast the Bourne. The Thames skirts the northeastern border of the county.

Agriculture.

Agriculture.—According to returns made on 4th June, 1887, the total area of land occupied was 759,538 acres, of which 646,653 were rented and 112,885 owned and occupied; 759,412 acres, or about seven-eighths of the whole area, were under cultivation. Of this area 395,010 acres were permanent pasture, a great portion consisting of sheep-runs on the Chalk downs. In some places, especially in Salisbury Plain, tillage was in former years extensively introduced in the Chalk districts, but much of this has again reverted to pasture. There were 174,876 acres under corn crops, 99,388 under green crops, 79,049 under rotation grasses, and 11,086 under fallow. In northwest Wilts the prevailing soil is a reddish chalky clay resting on a subsoil of broken stones, whilst on the Chalk formation the arable land is of a lighter character. There are also extensive tracts of richer soil well adapted for wheat and beans. In 1887 wheat occupied 67,357 acres, barley 50,928, oats 44,047, rye 1728, beans 7274, and pease 3542. The bulk of the green crops are grown for the feeding of cattle and sheep, potatoes occupying only 3339 acres and carrots 237, while 54,869 acres were under turnips and swedes, 5673 mangold, 10,473 cabbage, rape, etc., and 24,527 vetches, etc. The total area under nursery grounds in 1887 was 91 acres, while market gardens occupied 3525, and orchards 3346. Woods in 1881 occupied 45,270 acres, a great part being comprised in the ancient forests, including Cranborne Chase and Savernake Forest, which contain some remarkable old oaks and beeches. The number of horses in 1887 was 23,616, of which 18,980 were used solely for purposes of agriculture. Cattle numbered 106,020, 60,113 being cows and heifers in milk or in calf. Dairy farming is the leading industry in the northwestern districts, Wiltshire being famous for its cheese. Of the cattle 15,505 were two years and above, and 30,402 under two years, an indication that comparatively few cattle are kept for purposes of feeding. Sheep in 1887 numbered 643,125, and pigs 66,422.

According to the latest landowners' *Return*, Wiltshire was divided among 14,013 owners, possessing 828,949 acres at an annual valuation of £1,599,239 [$7,772,301.50], or about £1, 18s. 7d. [$9.38] per acre. There were 9635 owners possessing less than one acre each, 1519 acres being divided amongst them. The estimated extent of commons or waste lands was 1931 acres. The following proprietors owned over 7000 acres each: earl of Pembroke, 39,601 acres; marquis of Ailesbury, 37,994; marquis of Bath, 19,978; earl of Radnor, 17,173; Simon W. Taylor, 14,960; R. P. Long, 13,618; Sir John Needl, 13,113; trustees of Sir H. Meux, 11,896; marquis of Lansdowne, 11,146; earl of Suffolk, 11,098; earl of Normanton, 9812; Lord Ashburton, 9592; Sir E. Antrobus, 8374; Sir Francis D. Astley, 7888; Sir M. E. Hicks Beach, 7200; and T. Fraser Grove, 7179.

Communication.

Communication.—A considerable amount of traffic is carried on in the northern districts by means of canals. The Thames and Severn Canal crosses the northwest corner of the county. Between Cricklade and Swindon it is joined by a branch canal to the Wilts and Berks Canal. This last has a semicircular course southwestwards by Swindon, Wootton Basset, and Melksham, 2 miles beyond which it is joined by the Kennet and Avon Canal, which crosses the centre of the county by Hungerford, Devizes, and Bradford. The railway communication is supplied chiefly by the Great Western and the London and Southwestern lines.

Manufactures and trade.

Manufactures and Trade.—Wiltshire has long been celebrated for its cloths, the chief seats of the industry being Bradford and Trowbridge, while among other places Melksham and Chippenham are perhaps the most important. Wilton is still celebrated for its carpets. Haircloth weaving and the manufacture of cocoa-nut fibres are carried on at Melksham, and there are silk works at Chippenham, Malmesbury, Mere, and Warminster. Iron-smelting from the mines of the neighborhood is carried on at Westbury; portable engines are made at Devizes; and at Swindon are the engineering works of the Great Western Railway. Various towns are associated with different branches of the agricultural trade: Salisbury and Devizes have important corn markets; Chippenham, besides a trade in cheese, has a condensed milk manufactory; Wilton has a large sheep fair; and Calne is the centre of the Wiltshire bacon trade.

Population, etc.

Administration and Population.—Wiltshire comprises 29 hundreds, the city of Salisbury or New Sarum (population 14,792 in 1881), and the municipal boroughs of Calne (2474), Chippenham (1352), Devizes (6645), and Marlborough (3343). The county has one court of quarter sessions and is divided into fifteen petty sessional divisions. The city of Salisbury and the borough of Devizes have commissions of the peace and separate courts of quarter sessions, and the borough of Marlborough has a commission of the peace. Previous to the Act of 1885 the county was divided for parliamentary purposes into North and South Wilts, each returning two members, and included the following parliamentary boroughs—Calne, Chippenham, part of Cricklade, Devizes, Malmesbury, Marlborough, Salisbury city, part of Shaftesbury, Westbury, and Wilton. All these returned one member each, with the exception of Salisbury, which returned two; by the Act of 1885 they were all merged in the county divisions, with the exception of Salisbury, which was deprived of one member. The county was reformed into five parliamentary divisions, each returning one member,—north (Cricklade), into which the Wiltshire portion of Cricklade is merged; northwest (Chippenham), into which Chippenham and Malmesbury are merged; south (Wilton), into which Wilton is merged; east (Devizes), into which Devizes and Marlborough are merged; and west (Westbury), into which Westbury is merged. The county contains 340 civil parishes, with parts of seven others. It is mostly in the diocese of Salisbury. From 183,820 in 1801 the population by 1821 had increased to 219,574, and by 1841 to 256,280, and, although by 1861 it had diminished to 249,311, by 1871 it had again increased to 257,177; in 1881 it was 258,965, of whom 128,114 were males and 130,851 females. The number of persons to an acre is 0.30 and of acres to a person 3.35.

History and antiquities.

Ancient British roads and fortifications.

History and Antiquities.—In the importance of its early archæological remains Wilts takes a foremost place among the counties of England. In the river gravel-beds near Salisbury and elsewhere several specimens of flint implements of the Palæolithic age have been dug up, and the numerous barrows of the Chalk downs have yielded a great variety of stone implements of the Neolithic age, as well as of a later period. The ancient British boundary, the Wans Dyke, passed westwards across the county from Great Bedwin; west of Marlborough it still remains for many miles in a perfect condition. Traces of several other boundaries of a somewhat similar character are met with in other parts of the county. The British "ridgeway" runs northeastwards from Avebury, near the tumulus of Silbury Hill, to the ancient forts of Barbury and Badbury; other ancient British trackways have been converted into Roman roads. Among the principal ancient defensive works are Battlesbury and Scratchbury near Warminster; the entrenchments of Barbury and Badbury; Bratton, near Westbury, defended by double ramparts, in some places 36 feet in height, to which Guthrum the Dane is said to have retreated after his defeat by king Alfred; Casterly, on a ridgeway about 7 miles southeast of Devizes, described by Sir R. C. Hoare as "one of the most original and unaltered works of the British era which our country can produce"; Figbury Ring, 3 miles northeast of Salisbury, sometimes called Chlorus's camp, from the tradition that it was made by the British general Constantine Chlorus; Sidbury, 3 miles southwest of Collingbourne, probably an ancient British town; Vespasian's camp, between Amesbury and Stonehenge; and Yarnbury camp, in very perfect preservation, to the north of Wily. Ogbury camp, 6 miles north of Salisbury, is an undoubted British entrenchment, but probably a sheep-fold. The stone circles of Avebury and Stonehenge are the most remarkable megalithic structures in the kingdom; but their origin and date are the subject of much dispute. Durrington "walls," north of Amesbury, are probably the remains of a British village; there are also traces of others at several places on the slopes of the Marlborough Downs and Salisbury Plain.

Roman roads.

There are no records of the Roman invasion, though many evidences of Roman occupation remain. The ancient Fosse Way crossed the northwest corner of the county from Bath to Cirencester. From this last town another road passed southwards to *Cunetro* (Folly Farm near Marlborough), joining the *Via Julia*, which crossed the county from Bath to Silchester. From Salisbury one went northeast to Silchester, another east to Winchester, and another northwest to Bath. On the line of these roads remains of Roman villages have been found at different places.

History.

After the departure of the Romans Wilts was the scene of frequent contests, first between the Britons and the Saxons and afterwards between the Saxons and the Danes. Badbury is the reputed *Mons Badonicus* where king Arthur defeated Cerdic in 520. In 552 Cynric inflicted a severe defeat on a large army of Britons at Old Sarum, and in 556, after a great victory over them at Barbury Hill, he incorporated the country of the Wilsaetas in the kingdom of Wessex. In 823 Egbert, king of the West Saxons, gained a victory over Beornwulf, king of Mercia, at Ellandune near Wilton. Wilton itself was the scene of Alfred's defeat by the Danes in 871. In 878 the Danes plundered Chippenham, where Alfred had one of his residences, and made the town their headquarters; but afterwards Alfred inflicted on Guthrum such a severe defeat at Ethandune (supposed to be Edington near Westbury) that the Danes came to terms with him, the southwestern part of Mercia being henceforth held by the Saxons and the northeastern by the Danes. During the Danish invasions at the close of the 10th and the beginning of the 11th century the district was overrun by Sweyn, who pillaged and burned Wilton, as well as Old Sarum. At the latter town Canute died in 1036. During the conflict between Stephen and Matilda the strongholds of Sarum, Devizes, and Malmesbury were held by Bishop Roger for Matilda, until he was compelled to surrender them. During the Civil War Wiltshire sided chiefly with the Parliament. In 1643 Wardour Castle near Tisbury was bravely defended by Lady Blanche Arundell against Sir Edward Hungerford, and, although she was forced to capitulate, the castle was again taken by her son in 1645. In 1643 Essex was routed by Charles I. and Rupert at Aldbourn, and the same year Waller was defeated by Wilmot at Roundaway near Devizes. After the storming of Devizes Castle by Cromwell in September, 1645, the Cavaliers were wholly driven from the county.

Ancient edifices, etc.

The church of St. Lawrence, Bradford, converted at one time into cottages, is one of the most perfect specimens of ancient Saxon architecture existing; and there is also Saxon work in the churches of Britford (north and south door), Burcombe (east end of the chancel), Manningford Bruce, and a few other places. There is a large amount of Roman work in the church of Malmesbury abbey, much of it, however, being Transition; the church of St. John's, Devizes, retains its original Norman tower and exhibits Norman vaulting in the chancel; the chancel of St. Mary's in the same town is also Norman, and its porch has characteristic Norman mouldings; the churches of Preshute and Corsham contain interesting examples of the same style. Salisbury cathedral is the finest and most perfect example of Early English existing; and there is much good architecture of the same style in the churches of Amesbury, Bishop's Cannings, Cricklade, Collingbourne-Kingston, Downton, Edington, and Purton. The prevailing architecture is, however, Perpendicular, of which there are numerous fine examples, especially in the districts where good building stone is found; but in the Chalk districts, where the churches are constructed of flint, the architecture is generally inferior. There are numerous interesting examples of domestic architecture of the 14th, 15th, and 16th centuries. The only monastic remains of importance within the county are the abbey church of Malmesbury; the picturesque ruins of Lacock or Laycock abbey (3 miles south of Chippenham), founded in 1232 by Ella, countess of Salisbury; the walls of Bradenstoke priory (northeast of Chippenham), founded in 1142 by Walter d'Evreux for Augustinian canons, now converted into a farmhouse; and slight remains of the Cluniac priory of Monkton-Farleigh, founded in 1125. The fortress of Old Sarum is almost completely demolished, but the outlines of the defences remain; Devizes retains a few fragments, "built up again," according to Freeman, as "meaningless ornaments in the midst of the most fearful piece of modern gimcrack that human eyes ever beheld;" and the mound of Marlborough has been made into a "hill of pleasure." Trowbridge Castle, which was held for Matilda by Humphrey de Bohun, has completely disappeared, its site being occupied by modern buildings; and only a few small fragments remain of Ludgershall, which Matilda occupied on her escape from Winchester.

Distinguished persons.

Wilts has an unusually long roll of illustrious persons. Among divines, Hugh Latimer was rector of West Kington; Richard Hooker was rector of Boscombe; George Crabbe was for eighteen years rector of Trowbridge, and was buried in the chancel of the church; Dr. Henry Sacheverell was the son of a Marlborough clergyman; George Herbert and Archdeacon William Coxe were both rectors of Bemerton (near Salisbury); and Dr. Joshua Marshman, the Indian missionary, was born at Westbury. Of persons who have distinguished themselves in some form of literature we may mention Thomas Chubb, the Deist, who was a native of Harnham; Hobbes of Malmesbury; Philip Massinger, who was born at Salisbury; Joseph Addison, the son of the rector of Milston; Bryan Edwards, the historian; Aubrey and Britton, the antiquaries; Edmund Ludlow, author of the *Memoirs* of the Restoration period; and Sir R. Colt Hoare, the historian of Wilts. Statesmen are represented by "Orator" Hunt, Sir John Davies, Bolingbroke, Hyde, first earl of Clarendon, Harris, first earl of Malmesbury, Fox, first Lord Holland, Protector Somerset, and Henry Fawcett. Other persons of special distinction are Sir Christopher Wren, Sir B. Collins Brodie, and Thomas Willis, one of the founders of the Royal Society.

See Sir H. C. Hoare's *Ancient Wiltshire*, 1812-21, and *Modern Wiltshire*, 1822-1844; Aubrey and Jackson's *Topographical Collections for Wilts*, 1864; Britton's *Beauties*, 1801; Kite's *Monumental Brasses of Wilts*, 1860; Jackson's *Ancient Chapels of Wilts*, 1867; Jones's *Early Annals*, 1871; Saint George's *Visitation of Wilts*, 1623, 1882; Stratford's *Wiltshire and its Worthies*, 1882; and A. C. Smith's *British and Roman Antiquities in North Wilts*, 1884-85. (T. F. H.)

WIMBLEDON, a suburb of London, in the county of Surrey, is situated on the London and Southwestern Railway, 7¼ miles southwest of London. The old village of Wimbledon has been greatly extended of late years, the district being now a favorite residence for the London middle classes. Wimbledon Common, to the northwest of the village, was the meeting-place of the Rifle Association from its foundation in 1860 till 1888. At its southwestern extremity are the outlines of a British earthwork, called Cæsar's camp, having an extreme diameter of 950 feet and a diameter within the vallum of 750 feet. At Coombe's Hill and elsewhere British relics have been found. The parish church of St. Mary is supposed to date from Saxon times; but, after it had undergone various restorations and reconstructions, it was rebuilt in 1833 in the Perpendicular style. There are various other churches and chapels, all modern. A free library was established in 1887. The benevolent institutions include nine almshouses (1838), a cottage hospital (1867), a convalescent hospital (1867), and a hospital for infectious diseases (1877). The population of the urban sanitary district (area 3220 acres) was 9087 in 1871 and 15,950 in 1881.

Wimbledon (Wibbandune) is supposed to have been the scene of a battle in 568, between Ceawlin, king of Wessex, and Ethelbert, king of Kent, in which the latter was defeated. At Domesday it formed part of the manor of Mortlake, held by the archbishops of Canterbury. Afterwards the name was sometimes used interchangeably with Mortlake, and in 1327 it is described as a grange or farm belonging to Mortlake. On the impeachment of Arundel, archbishop of Canterbury, in 1398, it was confiscated. In the reign of Henry VIII. Cromwell, earl of Essex, held the manor of Wimbledon, with Bristow Park as an appendage. On the confiscation of Cromwell's estates in 1540 it again fell to the crown, and by Henry VIII. it was settled on Catharine Parr for life. By Queen Mary it was granted to Cardinal Pole. In 1574 Elizabeth bestowed the manor house, while retaining the manor, on Sir Christopher Hatton, who sold it the same year to Sir Thomas Cecil. In 1588 Elizabeth transferred the manor to his son Sir Edward Cecil, in exchange for an estate in Lincolnshire. At the time of the Civil War the manor was sold to Adam Baynes, who shortly afterwards sold it to General Lambert; and at the Restoration it was granted to the queen dowager, Henrietta Maria, who sold it in 1661 to George Digby, earl of Bristol. On his death in 1676 it was sold by his widow to the lord-treasurer, Danby. Some years after Danby's death it was purchased by Sarah, duchess of Marlborough, who demised it to her grandson, John Spencer. It was sold by the fifth earl Spencer in 1877. Wimbledon House, built by Sir Thomas Cecil in 1588, was destroyed by fire in 1785, and a new house, called Wimbledon Park House, was erected about 1801.

WIMBORNE MINSTER, a market town of Dorset, England, is situated on a gentle slope above the river Allen, near its confluence with the Stour, and on the Great Western Railway, 6 miles north of Poole and 114 west-southwest of London. The feature of the town is the ancient minster. As it now stands, it is a fine cruciform structure of various styles from Early Norman to Perpendicular, and consists of a central lantern tower, nave and choir with aisles, transepts without aisles, western or bell tower, north and south porches, crypt, and vestry or sacristy, with the library over it. Its maximum length is 182 feet, and its maximum breadth 102. The interior was restored in 1856-57. It contains a large number of interesting monuments, including a brass with the date 873 (supposed to mark the resting-place of Ethelred, third son of Ethelwulf), an orrery of the 14th century, and an octagonal Norman font of Purbeck marble. A new church, dedicated to St. John the Evangelist, was built and partly endowed in 1876. The free grammar-school, established in 1497, was refounded by Elizabeth, a portion of the revenues of the monastery being devoted to this purpose. New school buildings in the Elizabethan style were erected in 1851. There are two hospitals, St. Margaret's and Courtenay's. Near Wimborne is Canford Hall, the seat of Lord Wimborne, a mansion in the Tudor style, built by Blore in 1826, and improved from designs of Sir Charles Barry. The town depends chiefly on agriculture; but the manufacture of hose is carried on to a small extent, and there are also coachbuilding works. The population of the parish of Wimborne Minster (area 11,966 acres) was 5019 in 1871 and 5390 in 1881.

Wimborne (Saxon *Vinburnan*) is supposed to have been the *Vindogladia* or *Ventagladia* of the Romans. A nunnery was founded here in 712 by St. Cuthberga, sister of Ina, king of the West Saxons. It was destroyed by the Danes about 900, and subsequently became a house of secular canons, when the church became collegiate. The establishment existed till 1547. Wimborne is supposed to have been the scene of a battle between the earl of Devon and the Danes in 851, in which the latter were defeated. It was taken possession of by Ethelwold in 901. The duke of Monmouth was apprehended near Wimborne after his escape from Sedgemoor. The town claims to have been the birthplace of Matthew Prior, the poet.

WINCHESTER, a city, and a parliamentary and municipal borough, of Hampshire, England, is situated on the river Itchen, 66 miles southwest of London by the London and Southwestern Railway. The *Caer Gwent* (White City) of the Britons and *Venta Belgarum* of the Romans, Winchester was a town of much importance in early times, mainly on account of its central position on the Roman high roads in the south of England.[1] Temples to Apollo and Concord stood within the precincts of the present cathedral close; but in the 3d century the place is said to have become one of the chief centres of the early Celtic Christians. The Saxon invaders at the end of the 5th century treated the Roman name Venta as if it were a feminine substantive, and, transforming it into "Winte," called the town *Winte-ceaster*, "the City of the Winte;" hence the modern name Winchester. Throughout the Saxon period the city was one of the highest importance: early in the 6th century it became the capital of Wessex; and the kings of Wessex were crowned and usually buried in the cathedral. Even after the formation of the united kingdom of Anglia by Egbert, the great witan was still held in Winchester. It was also one of the chief centres for the coining of money under the pre-Norman kings: in the time of Athelstan it contained six mints, while London possessed only three. Even after the Norman Conquest many sovereigns were crowned and many parliaments held here; the celebrated Statutes of Winchester were passed in a parliament held in 1285. The city continued to be a favorite royal residence, and Henry II. rebuilt the palace on a larger scale.[1] This same king gave it its first regular charter of incorporation (1184). In the Middle Ages Winchester was famed for its wool trade and textile fabrics; in the 14th century it was the chief wool mart of England and had an extensive trade with France, Belgium, and Holland. In the 15th century its prosperity began to decline. In Cromwell's time the city suffered severely from a siege, during which Winchester Castle was dismantled. Charles II. began to build a palace on the site of this fortress, after designs by Sir Christopher Wren, but the death of the king prevented the work from being completed.[2]

---

[1] See Milner, *History of Winchester*, and Smirke, "Consuetudinary of Winchester," in *Arch. Jour.*, vol. ix.

The first Christian church at Winchester is said to have been destroyed during the persecution of Aurelian, and rebuilt in 293. It was again burned by the Saxons in 495. St. Swithun held the episcopate from 852 to 862, and enlarged the cathedral. The foundations of the adjacent abbey church of Hyde, in which some of the Saxon kings were buried, were discovered in 1886 close to the north side of the cathedral nave. The cathedral church was at one time associated with a priory of secular canons, but St. Ethelwold, bishop from 963 to 984, suppressed the secular foundation and built a Benedictine abbey in its place.[3] A wholly new cathedral was begun by Bishop Walkelin (1070–98), and in 1093 the eastern portion was consecrated jointly to St. Peter, St. Paul, and St. Swithun. The two Norman transepts and the low central tower still exist, as does also the very curious early crypt, east of the crossing. This is a low vaulted structure partly supported by a central row of columns; it has an apsidal termination, and is surrounded by an ambulatory, out of which a second smaller apse extends eastwards,—apparently a survival of the "confessio" of the earlier cathedral. The whole of the Norman nave was pulled down and rebuilt on a more magnificent scale by William of Wykeham at the end of the 14th century; the work was completed after his death by means of a large bequest. The choir was also remodelled in the 14th century and again much altered by Bishop Fox (1501–28).

In plan Winchester Cathedral consists of a nave, two transepts, choir, and retro-choir, all with aisles. A large lady chapel extends still further eastwards. The length of the whole building is no less than 546 feet, thus being greater than that of any other church in England, with the exception of St. Albans, which measures about the same length. One of its chief beauties is the magnificent reredos behind the high altar; this consists of a lofty wall, the full width of the choir, pierced by two processional doors, and covered with tiers of rich canopied niches, which once contained colossal statues. A cross of plain ashlar stone in the centre shows where an immense silver crucifix was once attached; and a plain rectangular recess above the altar once contained a massive silver-gilt retable; covered with cast and repoussé statuettes and reliefs, an elaborate work of the most costly magnificence. A second stone screen, placed at the interval of one bay behind the great reredos, served to enclose the small chapel in which stood the magnificent gold shrine, studded with jewels, the gift of King Edgar,[4] which contained the body of St. Swithun. In the choir is the plain tomb of William II., and under many of the arches of the nave and choir are a number of very elaborate chantry chapels, each containing the tomb of its founder. Some of these have fine recumbent effigies, noble examples of English mediæval sculpture; the most notable are the monuments of Bishops Edingdon, Wykeham, Waynflete, Cardinal Beaufort, Langton, and Fox. The font of black marble is an interesting example of 11th-century art; its sides are covered with curious reliefs representing scenes from the life of St. Nicholas. A good deal of very magnificent 14th-century stained glass still exists at Winchester.

Winchester College was built from 1387 to 1393 by **William of Wykeham** (*q.v.*). The foundation of the school consisted of a warden, ten fellows, three chaplains, seventy scholars, and sixteen choristers.[5] Its fine chapel, hall, cloister, and other buildings still exist in good preservation. About a mile distant from the town stands the hospital of St. Cross, founded in 1136 by Henry de Blois, bishop of Winchester, to provide board and lodging for 13 poor men and a daily dinner for 100 others. It was enlarged and mostly rebuilt by Cardinal Beaufort, 1405–47. The buildings are still in a good state of preservation, including the simple but very stately cruciform chapel, built about the year 1180, which in plan resembles a fine parochial church.[6] The whole place has been much injured by so-called "restoration."

Winchester suffered greatly in the plague of 1666, and its population was much reduced. At present its prosperity chiefly depends on the presence of the cathedral, the college, and its barracks, which accommodate about 2000 men. The city has several good schools and the usual public and charitable institutions. From the 23d year of Edward I. it returned two members to parliament until 1885, when it lost one member. The population of the municipal and parliamentary borough (area 1032 acres) was 16,366 in 1871 and 17,780 in 1881. (J. H. M.)

WINCHESTER, the county seat of Frederick county, Virginia, United States, is situated in the Shenandoah valley, about 700 feet above sea-level, and on a branch of the Baltimore and Ohio Railroad. It lies about 67 miles west-northwest of Washington. The surrounding country is rich and fertile, devoted to agriculture and cattle-raising, for which Winchester serves as a centre of supply and distribution. The city has manufactories of shoes, furniture, gloves, etc., and some iron foundries and tanneries. The population in 1880 was 4958 (1517 colored). In 1888 it was estimated at over 5000.

Winchester was laid out as a town in 1752 and incorporated in 1779. It has had a very slow growth, and during the Civil War it suffered severely from the armies of both combatants.

WINCKELMANN, **Johann Joachim** (1717–1768), historian of ancient art and the founder of scientific archæology, was born at Stendal in the Altmark (Prussia) on 9th December, 1717. His father was a poor shoemaker, and in his early years Winckelmann had to contend with great difficulties. With a passion for knowledge, however, he combined a resolute will; and by acting for some time as amanuensis to an old and blind rector he contrived to pass through the necessary courses of instruction at school. In 1737 he attended a gymnasium at Berlin and the school at Salzwedel, and in the following year he went as a student of theology to the university of Halle. He took little real interest in theology, and such interest as he had was quenched partly by the influence of the philosophy of Wolff, partly by the unfavorable impression made upon him by the Pietists. Through his connection with the chancellor Von Ludewig he was led to enter upon the study of German history; he devoted himself also with great enthusiasm to the study of Greek literature. He thought of becoming a physician, and began to attend medical classes at Jena; but the accomplishment of this scheme was beyond his means, and he was obliged to accept a tutorship near Magdeburg. In 1743 he was made associate-rector of a school at Seehausen in the Altmark, and this appointment he held for five years. He then went to Dresden, where he acted as librarian and general assistant to Count Henry Von Bünau, for whose history of the Holy Roman empire he collected materials. The treasures in the Dresden gallery awakened in his mind an intense interest in art, which was deepened by association with various artists, and especially with Oeser, who afterwards exercised so powerful an influence over Goethe when Goethe was a young student at Leipsic. Winckelmann's study of ancient literature had inspired him with a strong desire to visit Rome, and now he sought, through the papal nuncio Archinto, to obtain the appointment of librarian to Cardinal Passionei. Nothing could be done for him, however, unless he joined the Roman Catholic Church; this condition, after long hesitation, he ultimately decided to comply with.

---

[1] The hall of this palace still exists; it is illustrated by Turner in *Domestic Architecture*, London, 1851, vol. i. p. 176.

[2] Evelyn in his *Diary* (16th Sept. 1685) speaks of this as a "stately fabric" which had been "brought almost to the covering."

[3] See Britton, *Winchester Cathedral*, London, 1817.

[4] Great treasures of gold and jewels were presented to this cathedral by many of the early kings of England, especially by Canute, who gave his gold gem-studded crown to be hung over the great crucifix above the high altar.

[5] [Also 3 clerks, an usher, and a master, or in all 105 persons.—Am. Ed.]

[6] See a valuable account of St. Cross in the Winchester volume of the *Archæological Institute*, by E. A. Freeman.

In 1755 Winckelmann gave the first indication of his genius by the publication of his *Gedanken über die Nachahmung der griechischen Werke in Malerei und Bildhauerkunst.* This was followed by a pretended attack on the work, and a defence of its principles, nominally by an impartial critic. In the *Gedanken* Winckelmann suggested most of the doctrines he afterwards developed; and the book was warmly admired not only for the new ideas it contained but for the power and charm of its style. One good result of the impression it produced was that Augustus III., elector of Saxony and king of Poland, was induced to grant him a pension of 200 thalers [$141.40], that he might have an opportunity of prosecuting his studies in Rome. He arrived in Rome in November, 1755, and, with the exception of some brief intervals, remained there during the rest of his life. He became librarian to Cardinal Archinto, and also received much kindness from Cardinal Passionei; and after their death he was received as librarian and as a friend into the house of Cardinal Albani, who was forming his magnificent collection in his villa at Porta Salara. In 1763, while retaining this position, Winckelmann was made prefect of antiquities.

From the time of his arrival in Rome he devoted himself earnestly, at first with the aid of his friend Raphael Mengs, to the study of Roman antiquities, and he gradually acquired what was then an unrivalled knowledge of ancient art. In 1760 appeared his *Description des Pierres Gravées du Feu Baron de Stosch*, embodying the results of much work at Florence, where he had spent nine months in cataloguing the engraved gems collected by his friend Baron von Stosch. He published in 1762 *Anmerkungen über die Baukunst der Alten*, including an account of the temples at Pæstum. In 1758 and 1762 Winckelmann visited Naples for the purpose of studying the treasures excavated at Pompeii and Herculaneum; and from his *Sendschreiben von den herculanischen Entdeckungen* (1762) and his *Nachricht von den neuesten herculanischen Entdeckungen* (1764) scholars obtained their first authentic information about those groups of antiquities. Winckelmann again visited Naples in 1765 and 1767, and wrote for the use of the electoral prince and princess of Saxony his *Briefe an Bianconi*, which were published, eleven years after his death, in the *Antologia Romana.* For several years his energies were devoted chiefly to the preparation of his masterpiece, the *Geschichte der Kunst des Alterthums*, which was issued in 1764. It at once commanded attention and was soon recognized as a book that would take a permanent place in the literature not only of Germany but of Europe. In this great work Winckelmann sets forth both the history of Greek art and the principles on which it seemed to him to be based. He also presents a glowing picture of the conditions, political, social, and intellectual, which tended to foster creative activity in ancient Greece. The fundamental idea of his theory is that the end of art is beauty, and that this end can be attained only when individual and characteristic features are strictly subordinated to the artist's general scheme. According to Winckelmann, the true artist, selecting from nature the phenomena fitted for his purpose and combining them through the imagination, creates an ideal type marked in action by "noble simplicity and calm greatness,"—an ideal type in which normal proportions are maintained, particular parts, such as muscles and veins, not being permitted to break the harmony of the general outlines. In the historical part he used not only the works of art he himself had studied but the scattered notices on the subject to be found in ancient writers; and his wide knowledge and active imagination enabled him to offer many fruitful suggestions as to periods about which he had little direct information. The materials for the study of Greek art which have been recovered since Winckelmann's time have compelled archæologists to reject some of his conclusions, to modify others and to present the subject as a whole in a somewhat different light; but the writer was penetrated by so fine an enthusiasm, his style is at once so strong, so graceful, and so animated, and his descriptions of particular works of art are so vivid and true, that his book can never wholly lose its freshness. It marked an epoch by indicating the spirit in which the study of Greek art should be approached, and the methods by which investigators might hope to attain to solid results. To Winckelmann's contemporaries the work came as a revelation, and it exercised a profound influence on the best minds of the age. Goethe studied it eagerly, and it was read with intense interest by Lessing, who had found in a statement in the earliest of Winckelmann's works the starting-point for his *Laocoon.*

Winckelmann contributed various admirable essays to the *Bibliothek der Schönen Wissenschaften;* and in 1766 he published his *Versuch einer Allegorie*, which, although containing the results of much thought and reading, is not conceived in a thoroughly critical spirit. Of far greater importance was the splendid work entitled *Monumenti Antichi Inediti* (1767–68), prefaced by a *Trattato Preliminare*, presenting a general sketch of the history of art. The plates in this work are representations of objects which had either been falsely explained or not explained at all. Winckelmann's explanations were of the highest service to archæology, by showing that in the case of many works of art which had been supposed to be connected with Roman history the ultimate sources of inspiration were to be found in Homer.

In 1768 Winckelmann left Rome with the Italian sculptor Cavaceppi, intending to visit Germany. But he went no farther than to Vienna, where he was received with honor by Maria Theresa. At Trieste on his way back to Italy he made the acquaintance of a man called Arcangeli, to whom he showed some gold coins that had been given to him by the empress; Arcangeli's cupidity was excited, and during the night he entered Winckelmann's room, and, after having tried to throttle him, stabbed him five times. Winckelmann died of his wounds on 8th June, 1768. His murderer was caught and executed.

Winckelmann ranks amongst the foremost writers of the 18th century, and it is hardly possible to overrate the services rendered by him to archæology and the study of ancient art. With wide learning and an extraordinary power of accurate observation he combined imagination and feeling, and through him the modern world obtained for the first time something like a true conception not only of particular works of Greek art but of the general intellectual movement from which they sprang. If many of his ideas have now been abandoned, that is to a large extent due to the fact that scholars and thinkers were put upon the right track by his researches. His character as a man corresponded to his greatness as a writer. No difficulty was formidable enough to deter him from working out his vast schemes; and in relation to his friends and in general social intercourse he was distinguished by a noble generosity of spirit and thorough honesty of purpose.

An edition of his works was begun by Fernow in 1808 and completed by Meyer and Schulze (1808–20). There is an admirable study of his character and work in Goethe's *Winckelmann und sein Jahrhundert* (1805), to which contributions were made by Meyer and Wolf. The best biography of Winckelmann is the one by Justi, 2 vols., Leipsic, 1866–72. (J. SI.)

WIND. See METEOROLOGY, vol. xvi. pp. 129, 141, 142, 148–154.

WINDHAM, WILLIAM (1750–1810), English politician, came from an ancient family long resident at Felbrigg near Cromer in Norfolk. His father, Colonel William Windham, was an adventurous soldier with a taste for languages, both ancient and modern; William Windham, the statesman, was born in Golden Square, London, on 3d May, 1750. At the age of seven he went to Eton, which he quitted in 1766 for the university of Glasgow, and under the care of Dr. Simpson he acquired the taste for mathematics which always distinguished him. In 1767 he matriculated as gentleman commoner at University College, Oxford, where he remained until 1771. He never took the degree of B.A., but qualified as M.A. on 7th October, 1782, and received the degree of D.C.L. on 3d July, 1793. He made a tour in Norway in 1773 and visited Switzerland and Italy between 1778 and 1780. His maiden speech on the political platform was delivered at Norwich on 28th January, 1778, when he vehemently opposed the prosecution of the American War. On his return to England in 1780 he contested the representation of the city of Norwich, but was not successful. His entrance into public life took place in April, 1783, when he went to Ireland as chief secretary to Lord Northington, the lord-lieutenant under the coalition ministry of Fox and Lord North. Windham was his own keenest critic, his distrust in his own powers and his disappointment at his own achievements being conspicuous on every page of his *Diary*. Sickness compelled his return to England early in July, 1783; but change of scene and constant exercise restored him to health before the end of that year. In April, 1784, he again contested Norwich and was returned by a majority of 64 votes, thus scoring one of the few triumphs attained by the adherents of the coalition cabinet. This seat he retained until 1802, when he was beaten by William Smith, one of the Nonconformists. Though he strenuously opposed all proposals for parliamentary reform, to which most of the Whigs were deeply committed, Windham remained in alliance with that party until after the outbreak of the French Revolution, when he and several of his chief allies joined Pitt. The place of secretary-at-war was conferred upon him in July, 1794, and he was at the same time created a privy councillor and admitted to a seat in the cabinet. Windham discharged the duties of his office with unflagging zeal, his efforts being particularly directed towards ameliorating the condition of the inferior grades of the army. In the autumn of 1794 he was despatched to the duke of York's camp in Flanders with the views of his ministerial colleagues, but their advice could not counteract the military incapacity of the royal duke. When Pitt was frustrated in his intention of freeing the Catholics from their political disabilities, Windham, who in religious matters always inclined to liberal opinions, took his place among the ministers who retired from office (February, 1801). He was a constant opponent of all negotiations for peace with France preferring to prosecute the campaign at whatever cost until some decisive victory had been gained, and the temporary peace of Amiens, which was carried through under Addington's administration, did not meet with his approval. When he was ousted from the representation of Norwich (July, 1802), a seat for the pocket borough of St. Mawes in Cornwall was found for him by its patron the marquis of Buckingham, whose opinions coincided with Windham's on the leading political questions of the day. He declined a place in Pitt's new cabinet (May, 1802), on the ground that the exclusion of Fox, who had joined with them in opposition to the weak ministry of Addington, prevented the formation of an administration sufficiently strong in parliament and the country to cope with the dangers which threatened the safety of the nation, and he offered a general opposition to the measures which the prime minister proposed. On Pitt's death in January, 1806, the ministry of "All the Talents" was formed under the leadership of Lord Grenville, and Windham accepted the seals as secretary of state for war and the colonies. Fox's death necessitated several official changes; and a peerage was proposed for Windham, but he declined the proffered honor, and remained in office as long as the ministry existed. A general election took place in October, 1806, and Windham was elected for the county of Norfolk; but the election was declared void on petition, and he was compelled to sit for the Treasury borough of New Romney for which he had also been elected. In 1807, when the House was dissolved under the influence of the "No Popery" cry of Spencer Perceval, a seat was found for Windham by Lord Fitzwilliam in his close constituency of Higham Ferrers. Liberty of religious opinion he uniformly supported at all periods of his life, and with equal consistency he opposed all outbreaks of religious fanaticism; hence with these convictions in his mind few of the domestic measures of the new ministers met with his approbation. Moreover, he disapproved of the expedition to the Scheldt, and thought the charges brought against the duke of York as commander-in-chief, required his retirement from office. At the same time he actively opposed the bill of Sir Samuel Romilly, his colleague on most political questions, for reducing the number of offences visited with the punishment of death. In July, 1809, he received a blow on the hip whilst rendering assistance at a fire, which he thought little of at the time; but a tumor subsequently formed on the spot and an operation became necessary. This brought on a fever and Windham rapidly sank. He died on 4th June, 1810, and was buried in the family vault at Felbrigg.

Windham was tall and well-proportioned; and the impressiveness of his speeches was heightened by the excellence of his address. Exercise of all kinds had charms for him. He attended all the celebrated prize-fights of his day, and he more than once spoke in the House of Commons against the prevention of bull-baiting. Nor did he neglect the pleasures of literature and science. His speeches were published in three volumes in 1806, with a memoir by Thomas Amyot, his private secretary while he was in office in 1806, and his *Diary* was edited by Mrs. Henry Baring in 1866. The passages in the latter work relative to Dr. Johnson's declining days have been of considerable use to the later editors of Boswell.

WINDMILL. The date when windmills were first erected is unknown; but they were certainly used in Europe in the 12th century. Of late they have generally been replaced by steam engines in Great Britain; but they are still extensively employed in Holland in draining the polders and grinding trass. In America they are largely used; Wolff states that in some cities in the United States over 5000 windmills are manufactured annually. In spite of the competition of more powerful and tractable motors, windmills may often be used with success and economy, especially in new countries where fuel is scarce, and for work which can be done intermittently. The Indian Government recently made inquiries with a view to using windmills for irrigation, and a good deal of information will be found in a report by Colonel Brownlow in the *Professional Papers on Indian Engineering*, vol. viii. A windmill is not a very powerful motor, and in its employment its power is variable and intermittent. In good situations it will generally work for about eight hours out of the twenty-four on an average. Small windmills are useful on farms for working machines and pumping, in brickfields for pumping, and on ships for clearing out bilge water. They are employed for drainage purposes in Holland and Norfolk, and for mining purposes in some new countries. In parts of America they are used to pump water at railway stations. Sir W. Thomson has proposed to utilize them in charging electric accumulators. As an auxiliary to a steam engine they are sometimes useful; thus at Faversham a 15-horse-power windmill raised in ten months 21,000,000 gallons of water from a depth of 109 feet, saving 100 tons of coal.

European Windmills.—In all the older windmills a shaft, called the wind shaft, carried four to six arms or whips on which long rectangular narrow sails were spread. The wind shaft was placed at an inclination of 10° or 15° with the horizontal, to enable the sails to clear the lower part of the mill. The whip carrying the sail was often 30 to 40 feet in length, so that the tips of the sails described a circle 60 to 80 feet in diameter. The sails were rectangular, 5 to 6 feet wide, and occupying five-sixths of the length of the whip. A triangular leading sail was sometimes added. Sometimes the sails consisted of a sail-cloth spread on a framework; at other times narrow boards were used. The oldest mill was no doubt the *post* mill, the whole structure being carried on a post; to bring the sails to face the wind, the structure was turned round by a long lever. The post mill was succeeded by the *tower*, *smock*, or *frock* mill, in which the mill itself consisted of a stationary tower, and the wind shaft and sails were carried in a revolving cap rotating on the top of the tower. Meikle introduced in 1750 an auxiliary windmill or fan, placed at right angles to the principal sails, for automatically turning the mill face to the wind. If the wind shifts, the small fan begins to revolve and, acting through gearing, rotates the cap of the mill. Mills are exposed to great danger if the sails are not reefed or furled in high winds, and the reefing serves also to prevent the speed of the mill becoming excessive. In 1807 Sir W. Cubitt introduced automatic reefing arrangements. The sails were made of thin boards held up to the wind by a weight. As the strength of the wind increased, the boards were pressed back and exposed less surface.

American Windmills.—American windmills generally have the sails arranged in an annulus or disk. The sails consist of narrow boards or slats arranged radially, each board inclined at a constant angle of weather (see below); and the impulse of the wind on these inclined surfaces drives the mill. An American mill presents a larger surface for a given length of sail, and consequently the construction is lighter. To turn the mill face to the wind, a simple large rudder or fish-tail is used, projecting backwards in a plane at right angles to the plane of rotation of the sails. There is a great variety of mills in America, but those most commonly used are of two types. (1) In those which have side-vane governor wheels the action equivalent to reefing the sails is effected by turning the whole wheel formed by the sails oblique to the wind, so as to diminish the wind's action. A side vane projects in the plane of rotation of the wheel, and the pressure of the wind on this tends to turn the wheel edgeways to the wind. This turning force is counterbalanced by a weight. Hence for moderate winds the wheel is held up face to the wind; for stronger winds it is turned obliquely. (2) In centrifugal governor mills the slats forming the wheel are connected together in sets of six or eight, each set being fixed on a bar at about the middle of its length. By rotating this bar, the boards or slats are brought end on to the wind, the action being analogous to shutting an umbrella. The boards are held up to the wind by a weight, and are also connected to a centrifugal governor. If the speed of the governor increases, the balls fly out and lift the weight; at the same time the sails are partially furled.

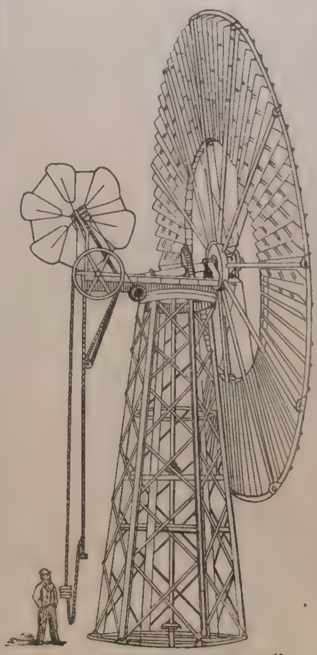

FIG. 1.—Warner's annular sail windmill.

Warner's Annular Sail Windmill.—Messrs. Warner of Cripplegate (London) make a windmill somewhat similar to American mills. The shutters or vanes consist of a frame covered with canvas, and these are pivoted between two angle-iron rings so as to form an annular sail. The vanes are connected with spiral springs, which keep them up to the best angle of weather for light winds. If the strength of the wind increases, the vanes give to the wind, forcing back the springs, and thus the area on which the wind acts diminishes. In addition, there are a striking lever and tackle for setting the vanes edgeways to the wind when the mill is stopped or a storm is expected. The wheel is kept face to the wind by a rudder in small mills; in large mills a subsidiary fan and gear are used. Fig. 1 shows a large mill of this kind, erected in a similar manner to a tower mill. The tower is a framework of iron, and carries a revolving cap, on which the wind shaft is fixed. Behind is the subsidiary fan with its gearing, acting on a toothed wheel fixed to the cap.

Relation between the Velocity of the Wind and its Pressure on Surfaces.—When a flat tin plate is exposed normally to the wind, the pressure on its front surface is increased and that on its back surface somewhat diminished. The resultant total pressure per square foot in the direction of the wind is given approximately by the equation

$$p = .005\,v^2 \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (1)$$

if v is in miles per hour, or

$$p = .0023\,v^2 \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (1a)$$

if v is in feet per second. Thus, winds at velocities of 5, 10, and 20 miles per hour would give a pressure of ⅛ ℔, ½ ℔, and 2 ℔ respectively on each square foot of a surface normal to the wind, and these may be considered ordinary working velocities for windmills. In storms the velocity of the wind may reach a much greater value. Pressures of 28 or 30 ℔ per square foot have been frequently registered by anemometers, and at exceptionally exposed stations pressures of 50, 80, and even 90 ℔ per square foot have been recorded. These pressures, which are useless for working the windmill, must, nevertheless, be reckoned with in deciding on its structural strength.

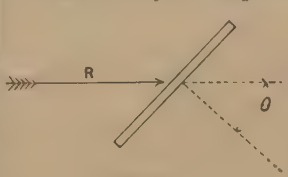

FIG. 2.

Pressure on Surfaces Oblique to the Wind.—The variation of pressure with inclination of surface is only known experimentally. Let R be the direction of the wind, making an angle θ with the normal to the surface supposed to be at rest. Then, if p is the pressure per square foot of surface, when the wind is normal to the surface, the resultant normal pressure on the oblique surface is

$$n = p\frac{2\cos\theta}{1+\cos^2\theta}\text{ ℔ per square foot }\ldots\ldots\ldots(2).$$

But the windmill sail moves in a direction perpendicular to the wind. Hence, if v is the velocity of the wind and u that of the sail, the relative velocity is $\sqrt{u^2+v^2}$, and the direction of relative motion can be found as follows. Let aa be the plane of rotation of the sail. The inclination θ of the sail to the plane of rotation is called the *angle of weather*, and is the same as the angle the wind makes with the normal to the sail. Set off $ob = v$, $bc = u$, then oc is the relative velocity, and this makes an angle $\phi = \tan^{-1}\frac{u}{v}$ with the direction of the wind and an angle $\theta+\phi$ with the normal to the sail, Hence for the moving sail

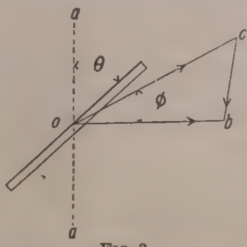

FIG. 3.

$$n = p\frac{2\cos(\theta+\phi)}{1+\cos^2(\phi+\theta)}\ldots\ldots\ldots\ldots\ldots\ldots(3).$$

Before replacing p by its value in (1) another consideration requires attention. The sail generally moves faster than the wind; it is not a thin-edged plane, but presents a not inconsiderable surface at right angles to its direction of motion, and thus creates resistance. Of the whole pressure of the wind a part only is effective, the rest being used to overcome the resistance of the sail. It will be assumed that the effective pressure driving the sails is only for v in feet per second, $p = .001\ v^2$ ℔ per square foot, and therefore, the effective normal pressure on the sails is, for the relative velocity $\sqrt{v^2+u^2}$, $n = .001(v^2+u^2)\frac{\cos(\theta+\phi)}{1+\cos^2(\theta+\phi)}$. The component of this in the direction of motion of the sail is $n\sin\theta$. Consequently the useful work of the sail expressed in foot-pounds per square foot is $nu\sin\theta = .001(v^2+u^2)u\frac{\sin\theta}{\sec(\theta+\phi)+\cos(\theta+\phi)}$. By dividing the sail into strips and introducing the known values of u, v, and θ the work done is easily found.

Best Angle of Weather.—The best angle of weather is that which makes $\frac{\sin\theta}{\sec(\theta+\phi)+\cos(\theta+\phi)}$ a maximum. This gives the very simple rule $\theta = 67\tfrac{1}{2}^\circ - \tfrac{3}{4}\phi$. Given the velocity of the wind and that of the tips of the sails, the value of ϕ is easily found for any point of the sail, and thence θ. Thus, for

$$\begin{array}{llllll}
\frac{u}{v} = 3.0 & 2.5 & 2.0 & 1.5 & 1.0 & 0.5, \\
\phi = 72^\circ & 68^\circ & 64^\circ & 57^\circ & 45^\circ & 27^\circ, \\
\theta = 13\tfrac{1}{2}^\circ & 16\tfrac{1}{2}^\circ & 19\tfrac{1}{2}^\circ & 24\tfrac{1}{2}^\circ & 33\tfrac{1}{2}^\circ & 47\tfrac{1}{2}^\circ.
\end{array}$$

Horse-power of Windmills.—For the older kinds of windmills the following rule derived from some experiments by Coulomb may be used. Let n = no. of sails, A area of each sail in square feet, v velocity of wind in feet per second; then the horse-power of the mill is $\frac{nAv^3}{1{,}660{,}000}$; this assumes the speed of the tips of the sails to be about 2½ to 3 times the wind velocity. For American wheels Wolff gives the horse-power which may be expected for an average of 8 hours per day as follows:

Diameter of Wheel in Feet	Velocity of Wind in Miles per Hour.	Horse-Power of Mill.	Revolutions of Wheel per Minute.
8½	16	0.04	70—75
10	16	0.12	60—65
12	16	0.21	55—60
14	16	0.28	50—55
16	16	0.41	45—50
18	16	0.61	40—45
20	16	0.78	35—40
25	16	1.34	30—35

Further information will be found in Rankine, *The Steam Engine and other Prime Movers*; Weisbach, *The Mechanics of Engineering*; and Wolff, *The Windmill as a Prime Mover.* (W. C. U.)

WINDSOR,[1] a parliamentary and municipal borough of Berkshire, England, 21 miles from London by the Great Western Railway, situated on the right bank of the Thames, is chiefly remarkable for its royal castle. The town itself[2] is of no special interest, in spite of its great antiquity. In 1276 Edward I. made Windsor a free borough. In 1302 it began to send representatives to parliament, though at irregular intervals, and from the time of Henry VI. it returned two members till 1867, when they were reduced to one. The town is presided over by a mayor, aldermen, and councillors, who were incorporated by a charter of Edward IV. The town-hall was built in 1686 by Sir Christopher Wren, but was much altered in 1852. The Thames is crossed here by a bridge resting on three granite piers (1823). The parish church of St. John the Baptist was rebuilt in 1822; the other two churches are also modern. The town was formerly celebrated for the number of its inns, of which "The Garter" and "The White Hart" were the chief. The former was the favorite inn of Shakespeare's Sir John Falstaff, and is frequently mentioned in the *Merry Wives of Windsor.* In 1650 the town contained 70 inns, many of which were very picturesque half-timbered buildings; but none of these now exist. In 1871 the population of the municipal borough was 11,769 and in 1881 12,273; that of the parliamentary borough (area 3253 acres) in the same years was 17,281 and 19,082 respectively. Of this last total 3464 were in Buckinghamshire, into which county the parliamentary borough of Windsor extends.

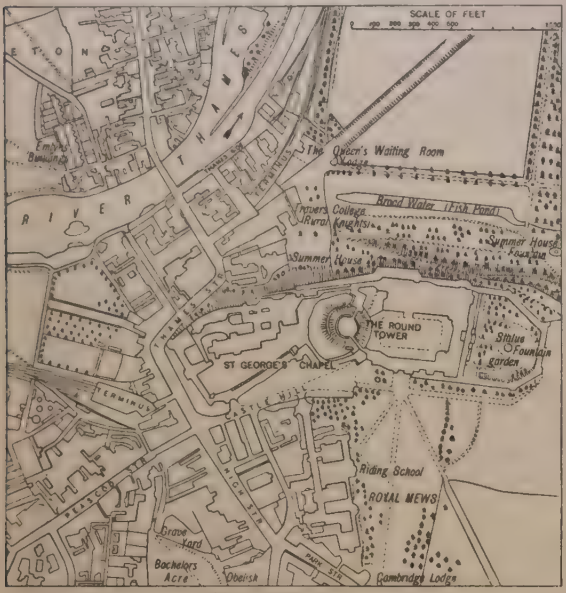
Windsor Castle, from its commanding position, its stately group of ancient buildings, and its long list of historical associations, is one of the most magnificent and interesting of royal palaces. It has for many centuries been the chief residence of the English sovereigns.[3] As early as the time of the Heptarchy a stronghold of some importance existed at Windsor; the chief part of this still remains, and forms the great circular mound, about 125 feet in diameter, on which the Round Tower now stands. This great earthwork was once surrounded by the fosse, agger, and vallum which were usually constructed to defend both Roman and Saxon strongholds. The primitive wooden enclosure was replaced by a stone circuit-wall in the time of William the Conqueror; and the first complete Round Tower was built by Henry III. about 1272, but was wholly reconstructed on a more massive scale by Edward III., who in 1344 designed the new tower to form a meeting-place for his newly-established order of the Knights of the Garter. Edward selected this spot because, according to a popular legend (quoted by Froissart), it was on the summit of the circular mound that King Arthur used to sit surrounded by his knights of the Round Table. The main bulk of the present Round Tower is of this date; but its walls were heightened, and the tall flag-turret was added by the court architect, Sir Jeffrey Wyatville, in the reign of George IV. In addition to the Round Tower, Henry III. constructed long lines of circuit-walls, crowned at intervals with many smaller towers, one of which, named after him, still exists in good preservation. He also built a great hall, kitchen, and other apartments, together with a chapel, which was afterwards pulled down to make room for the present chapel of St. George. The beautiful little chapel cloister which Henry III. built still exists, and on its walls are traces of contemporary paintings in distemper. Another chapel was built by Henry III. and dedicated to his favorite saint, Edward the Confessor. This graceful building, with an eastern apse, is now called the Albert Memorial Chapel; a good deal of Henry III.'s work still exists in the lower part of its walls, but the upper part was rebuilt in 1501–3 by Henry VII. Some years later the unfinished chapel was given by Henry VIII. to Cardinal Wolsey, and for long after it was known as "Wolsey's tomb-house." Wolsey engaged a Florentine sculptor named Benedetto[1] to make him a very magnificent and costly tomb of marble and gilt bronze, with a recumbent effigy at the top, probably very similar in design to Torrigiano's tomb of Henry VII. at Westminster. The rich bronze work of Wolsey's tomb was torn off and melted by order of the Commonwealth in 1642, and the mere metal was sold for the then large sum of £600 [$3309]. In 1805 the black marble sarcophagus, stripped of its bronze ornaments, was moved from Windsor and used as a monument over Nelson's grave in the crypt of St. Paul's. Though Wolsey's tomb-house was roofed in and used for mass by James II., the stone vaulting was not completed till recent times, when the whole place was fitted up by Sir Gilbert Scott as a memorial to the Prince Consort. Its internal walls were then lined with rich marbles, and decorated with reliefs by Baron Triqueti, in a style somewhat tawdry and discordant with the old building.

---

[1] The name is said to be derived from *Windelsora* (A.S. *windel*, "to wind," and *or*, a "shore," from the winding course of the Thames).

[2] In official documents the town is called New Windsor, to distinguish it from its parent settlement Old Windsor, which is now a village prettily situated about two miles to the southeast of Windsor Castle.

[3] See Loftie, *Windsor*, reprinted with etchings from *The Portfolio*, London, 1885; Tighe and Davis, *Annals of Windsor*, 1860; and Ashton, *Illustrations of Windsor Castle*, 1841.



Plan of Windsor.

The magnificent chapel of St. George ranks next to Westminster Abbey as a royal mausoleum, though no king was buried there before Edward IV., who left directions in his will that a very splendid tomb was to be erected with an effigy of himself in silver. Nothing now remains of this, except part of the wrought iron grille which surrounded the tomb—one of the most elaborate and skilfully wrought pieces of iron-work in the world. This grille has recently been moved from the north aisle to the north side of the sanctuary. The next sovereign buried here was Henry VIII., who directed that his body should be laid beside that of Jane Seymour, in a magnificent bronze and marble tomb. The tomb was never completed, and what existed of its metal-work was probably melted down by the Commonwealth. No trace of it now remains. The chapel itself is one of the finest examples of Perpendicular architecture in England, and is, on the whole, finer in design than the other two royal chapels, those of King's College at Cambridge and that of Henry VII. at Westminster, which were a little later in date. The existing building was begun by Edward IV., who in 1473 pulled down almost the whole of the earlier chapel, which had been completed and filled with stained glass by Edward III. in 1363. The nave of St. George's was vaulted about the year 1490, but the choir groining was not finished till 1507; the hanging pendants from the fan vaulting of the choir mark a later development of style, which contrasts strongly with the simpler lines of the earlier nave vault. In 1516 the lantern and the rood-screen were completed, but the stalls and other fittings were not finished till after 1519.

The present private apartments of the sovereign at Windsor were mostly rebuilt or remodelled by Sir Jeffrey Wyatville, but some of the rooms, and especially the library, contain fine mantelpieces and ceilings of the 16th and 17th centuries. Among the many treasures preserved in the royal library is a fine collection of drawings by the chief Italian painters, together with three volumes of MSS. in the autograph of Leonardo da Vinci, illustrated with many drawings by his hand.[2] The library also contains a magnificent series of portraits by Holbein, eighty-seven in number, highly finished in sepia and chalk, representing the chief personages of Henry VIII.'s court—all of them works of the highest beauty and marvels of iconic vigor. The foundation attached to the royal chapel, which possesses the privileges of a "royal peculiar," consists of a dean, who is exempt from any episcopal jurisdiction, and a college of canons.

The royal forest of Windsor is one of the finest in the country, though it has been much reduced in size even since 1790, when it contained about 60,000 acres; many of its oaks are of great size and antiquity.

WINDWARD ISLANDS. See West Indies.

WINE.

THE word "wine" in its widest sense includes all alcoholic beverages derived from sacchariferous vegetable juices by spontaneous fermentation; in the narrower sense of its ordinary acceptance it designates the fermented product of grape juice, with which alone the present article proposes to deal.

Part I.—Chemistry.

Vinous fermentation. Vinous fermentation, phenomenally and chemically, is fully explained under Fermentation (vol. ix. p. 81 *sq.*). From what is said there it will be readily understood that wine-making is an easy art where there is a sufficient supply of perfectly ripe grapes. In Italy, Spain, Greece and other countries of southern Europe nature takes care of this; in the more northern of the wine-producing districts of France, and especially on the Rhine in Germany, the culture of the vine means hard work from one end of the year to the other, which only exceptionally finds its full reward. And yet it is in those naturally less favored districts that the most generous wines are produced. Southern wines excel in body and strength; but even the best of them lack the beautiful aroma (*Blume* or *bouquet*) characteristic of high-class Rhine wine. The large proportion of sugar in southern grape juice would appear to be inimical to the development of that superior flavor. Yet in Missouri, for instance, where wine is produced in pretty much the Rhenish way, from Rhenish kinds of grapes, which there ripen far more readily than they do at home, no wine equal in flavor to real Rhine wine has as yet been made. It seems that the hard struggle for existence which the vine-plant has to fight on the Rhine is essential for the development of the peculiar flavor of the wine.

---

[1] Probably a son or nephew of the Florentine sculptor Benedetto da Maiano, who died in 1497; another member of the same family was employed by Wolsey at Hampton Court.

[2] These have recently been printed with an English translation by Dr. Richter, London, 1883. See also Dr. Waagen, *Treasures of Art in Britain*, London, 1854, vol. ii.

Processes for maturing wine.

To secure the highest attainable degree of maturity in the grapes, the vintage on the Rhine is postponed until the grapes almost begin to wither, and the white grapes on the sunny side of the bunches exhibit a yellowish brown (instead of a green) color and show signs of flaccidity. In the best vineyards (where it is worth the trouble) the bunches are carefully sorted, the ripest being put aside and pressed by themselves. In some places even the individual bunches are analyzed and the best berries cut out with a pair of scissors, to be used by themselves. The processes concerned in the extraction of the juice are described below (p. 637). If the production of red wine is intended, the juice is allowed to ferment over the stalks and skins until enough of alcohol has been produced to enable the juice to extract the pigment from the skins. After that juice and residue are separated. The alcohol, however, extracts other things besides the pigment, especially tannin, which imparts to red wines their characteristic astringency. The must (or magma of crushed grapes) is immediately conveyed to a cool cellar, the temperature of which should lie between 9° and 12° C., and is placed in large tubs or vats or open casks, and is then left to itself. Although no yeast is added from without, vinous fermentation sets in sooner or later, and after some four to five days is in full swing. On the seventh day, as a rule, the process has passed its climax, and after ten to fourteen days the yeast-scum on the surface disappears and the liquid clears up. It now constitutes what is called *Jungwein*, which still contains a considerable remnant of unfermented sugar. This young wine is drawn off into large casks and placed in cellars having a temperature of 9° to 12° C.; there it is left for some months, generally until the following March. The casks are filled almost to the bung-hole and kept full by the occasional addition of wine, the small bung-hole being covered so as to provide an outlet for the carbonic acid, without giving any greater access to the air than is absolutely unavoidable, to prevent acetous fermentation. During this period the small remnant of sugar in the young wine gradually ferments away, while the percentage of alcohol undergoes a corresponding gradual increase. As this after-fermentation progresses very slowly, there is no perceptible increase of temperature in the liquid, and even the newly-formed yeast cells remain deposited at the bottom as a precipitate. On it certain components of the must, being less soluble in (alcoholic) wine than in the must, separate out, as, for instance, the albumenoids and, most markedly, the bitartrate of potash; this last separates out conjointly with tartrate of lime and coloring-matters, as a coherent crust known as *argol*. The finished young wine is drawn off clear into smaller casks, bunged up, and allowed to mature. It is during this period that the "bloom" of the wine develops, probably through the very slow formation of ethers from the alcohol and the acids previously produced, or from traces of higher alcohols by oxidation. How long a wine should be allowed to mature depends on its richness. With relatively poor wines a year's maturing may be amply sufficient; rich wines continue improving for years.

To give an idea of the composition of grape juice, we quote two analyses of high-class musts of 1868, by Neubauer. (See Table I.)

Supposing such musts to ferment, the albumenoids are partly precipitated as components of the yeast or otherwise, or decomposed, with formation of ammonia salt; part of the phosphates go into the yeast likewise; the greater part of the bitartrate of potash of the juice is precipitated as argol; and the greater part, if not all, of the sugar is decomposed, with formation from every 100 parts of sugar destroyed of alcohol 48.5, carbonic acid 46.9, succinic acid 0.7, glycerin 3.0, matter passing into the yeast 0.9 as principal products.

TABLE I.

	Neroberg Riesling.	Steinberger Auslese.

Mineral matter	0.47	0.45
Total solids	23.28	29.22
Water (by diff.)	76.72	70.78
	100	100

Minor fermentations.

Besides the predominating process of vinous fermentation proper, certain minor fermentations and other by-reactions take place, which lead to the formation of free acetic and other fatty acids, ethers, and traces of higher alcohols. Of these last, however, which play such an important part in whiskey-brewing, only very little is formed in grape-juice fermentation. Of the by-products the ethers are undoubtedly the most important, because it is they that constitute the bloom; but our knowledge regarding them is very limited. The flavor of a wine is due to two sets of volatile bodies, namely—(i.) œnanthic ether (see ŒNANTHIC ACID, vol. xvii. p. 752), to which is due the smell common to all wines (which remains in an empty wine cask after the bloom proper has gone), and (ii.) a set of ethers (are they ethers?) which constitute the *Blume*. Geiger distilled a bottle of good wine and then re-mixed residue and distillate. But the mixture was not drinkable; yet, after having been bottled up for a long time, it gradually regained its original virtues. These remarks apply only to white Rhenish wines. Red wines, in addition to the components named, contain chiefly coloring and astringent matters. The wines of Hungary, France, etc., as is well known, have a different character from those of the Rhine region; but the scientific analysis of the relations is of comparatively little importance.

In all rich musts part of the sugar escapes fermentation and imparts to the wine a higher or lower degree of sweetness; southern wines (port, sherry, etc.), even in their natural condition, contain relatively large percentages of sugar. In their case it is chiefly this sugar, in Rhine wine the glycerin and what there may be of unchanged sugar, which constitute the "body" of the wine. Spanish and Portuguese wines, however, especially those intended for exportation into Great Britain, are habitually doctored by the addition of cane sugar and cognac.

Wine-brewing.

Wine-Brewing.—One mode of assisting nature in wine-making is the process of "gallisizing," so called from its inventor (Gall), which is largely practiced on the Rhine. In a given vineyard the must produced in a good year is characterized by certain percentages of free acid and of sugar. In bad years the latter decreases and the former increases. But this, according to Gall, can be easily remedied by adding sugar and water in sufficient quantity to establish the percentages of free acid and sugar which are characteristic of the best years, and then allowing the mixture to ferment. The sugar is added sometimes in the form of cane sugar (which is no doubt the best substitute for natural grape sugar obtainable), but more frequently in the form of what is known in commerce as "grape sugar," which is in reality more or less impure dextrose produced from potatoes or maize starch (see SUGAR, vol. xxii. p. 655–6). Scientifically speaking, Gall's method appears to be unobjectionable; but that it does so is really owing to our ignorance of the intricacies of the actual process of grape-juice fermentation. In any case, grape juice is one thing and dextrose plus so much pump-water is another; and the sale of gallisized as "natural" wine must be pronounced a fraud. Science affords a means of distinguishing a gallisized from a natural wine, if the added sugar consisted of dextrose. The sugar of normal grape juice is half dextrose and half lævulose; a similar mixture is produced from added cane sugar. In the process of fermentation the dextrose is the first to disappear; the rest of the lævulose then follows. Hence a finished natural wine, if it turns the plane of polarized light at all, will turn it to the left; but, if the wine was doctored with dextrose, certain dextro-rotatory impurities survive to the end and the wine turns the plane of polarization to the right (Neubauer). A commission of experts who met in Berlin in 1884 declared gallisizing to be a legitimate practice as long as the water added does not amount to more than twice the weight of the added sugar. Liebig long ago recommended the addition of a concentrated solution of neutral tartrate of potash to ready-made wine, as a means for reducing its acidity. If the free acid is tartaric, it combines with the tartrate into cream of tartar, which gradually separates out and can be removed by decantation or filtration. Long before Gall, Chaptal showed that bad must may be improved by adding the calculated weight of (cane) sugar and neutralizing the excessive acid by means of powdered marble. The principal feature in Chaptal's, as compared with Gall's method, is that it discards the resources of the pump.

Plastering wine.

In Spain, Portugal, and France it is a very common practice to dust over the grapes with plaster of Paris or to add the plaster to the must. The intention is, in the former case, to prevent putrefaction of the berries, in the latter to add to the chemical stability of the wine. According to experience, a plastered wine is ready for bottling sooner than it would be in its natural condition. The chemical process involved consists in this: the sulphate of lime, $CaSO_4$, decomposes the bitartrate of potash, $(C_4H_4O_6)KH$, of the must, with the formation of insoluble tartrate of lime, $(C_4H_4O_6)Ca$, and soluble acid sulphate of potash, $KHSO_4$. The latter takes up potash from, chiefly, the phosphate present and becomes normal salt, K_2SO_4, with the formation of free acid (*e.g.*, phosphoric acid). A plastered wine is relatively rich in potash and in sulphuric acid. Amongst German wine-analysts it is customary to report all the sulphuric acid found as sulphate of potash, K_2SO_4. If the calculated sulphate amounts to less than 2 grammes per litre, the wine is passed as being at any rate not excessively plastered. But the interpretation of a sulphuric acid determination, in the case of German wines more especially, is rendered very uncertain owing to the widely spread practice that prevails of disinfecting wine-casks with sulphurous acid (by burning sulphur within them) before they are used.

Want of space will not allow of the treatment of wine analysis generally; but sufficient has been said to show how far the genuineness of a wine can be proved by chemical analysis. Against the most important and frequently occurring fraud, namely, the substitution of a genuine, but inferior, for a high-class wine of a similar kind, chemical analysis is at present absolutely powerless.

Injurious ferments, etc.

It sometimes happens that wine becomes viscous and forms threads when poured from the bottle. This mischief, which is caused by the development of a foreign ferment, can be cured by the judicious addition of a solution of tannin, which precipitates the "gum." From a similar cause comes acetous fermentation, which always takes place in a moderate degree, but may assume undue dimensions. Red wines are liable to develop a foreign substance which imparts to them a bitter taste. A wine kept in a mouldy cask assumes of course a mouldy taste and smell. Sometimes a wine will "capsize": the alcohol and the acid disappear and what was wine becomes an insipid undrinkable liquid. Most of the injurious effects caused in wine by foreign ferments can be prevented by a process introduced by Pasteur. The wine is kept for a sufficient time at a temperature of 70° C. in the absence of air, and then transferred to a germ-free cask, without allowing it to come in contact with more air than can be helped. The only objection to Pasteur's precautionary method is that it renders the wine slightly flat through the removal of part of its carbonic acid. No doubt these deleterious consequences might be prevented to a very great extent if the fermentation were conducted from the first in casks which communicated with the air only through a (wide enough) tube full of cotton wool, which medium is known to filter off all germs (see FERMENTATION, vol. ix. p. 81).

Sparkling wines.

Effervescing or Sparkling Wines.—These wines are largely impregnated with carbonic acid engendered by an after-fermentation in the closed bottle by means of added sugar. The art originated in Champagne, where the best sparkling wines are produced, and whence it has spread to the Rhine, the Moselle, and other districts. The natural wine of Champagne is not of a very high order; yet it produces the best champagne. For champagne-making blue grapes are preferred. In eliminating the juice excessive pressure is avoided, so as to keep the must clear of particles of skin. The processes of fermentation and clearing, as well as those connected with the making of champagne generally, are described in detail below (p. 638). Champagne-makers distinguish three grades of effervescence. In *mousseux* the pressure in the bottle amounts to from 4 to 4½ atmospheres; in *grand mousseux* it reaches 5 atmospheres; and less than 4 atmospheres' pressure constitutes *cremant* (from *la crème*, "cream"), a wine which throws up a froth but does not give off carbonic acid violently. A champagne which contains relatively little sugar is called "dry"; it is chiefly this kind which is imported into Great Britain, where champagne is used habitually as a dinner wine. In France a sweet wine is preferred. The intensely sweet substance called "saccharine" (see SUGAR, vol. xxii. p. 656) has been utilized for producing a sparkling wine which is both sweet and dry. Cheap champagnes may be (and we believe are) produced by simply adding sugar and some flavoring matter to wine, and then pumping in carbonic acid in the soda-water fashion. The following extract from a table by August Dupré will show the chemical composition of the wines most popular in Great Britain. The numbers may be read as grammes per litre or as ounces per 1000 fluid ounces.

(W. D.)

PART II.—INDUSTRY AND TRADE.

At the present day wine is practically a European product, although a certain quantity is made in the United

States, at the Cape of Good Hope, and in Australia. The principal countries in Europe where the vine is grown to any extent are France, Spain, Portugal, Austria-Hungary, Italy, Germany, and the southern portions of Russia and Greece; but in the first six alone is wine an article of much commercial importance.

Historical sketch. In the lands of the Levant the use of wine is as old as the earliest memory of civilization, and we find its introduction ascribed to gods (Dionysus in Greece, Osiris in Egypt), or, in the case of the Hebrews, to the patriarch Noah, the second father of mankind. Corn, wine, and oil appear together (as in the Old Testament) as the main gifts of the soil, the material bases of life and comfort. The cultivation of the vine was the highest achievement of ancient husbandry, impossible to semi-nomadic peoples, who might grow a corn crop, but did not remain long enough in one spot to form vineyards. Thus the vine and the olive are in antiquity the marks and almost the symbols of settled and cultured life. Starting perhaps from Armenia and eastern Pontus, viticulture gradually made its way through the lands of ancient civilization, rejected only by a race like the NABATÆANS (*q.v.*), whose laws were directed to prevent the transition from nomadic to settled life (cp. the Old Testament Rechabites). Of Asiatic wines the most famous was that of Chalybon (Helbon) near Damascus, which was an article of Phœnician commerce in the time of Ezekiel (xxvii. 18) and at a later date furnished the tables of the Persian kings. Of Greek wines the most famous came from the islands (as Chios, Lesbos, Cos) or from points on the Asiatic coast (Strabo, xiv. p. 637). The vine reached Spain through the Phœnicians, and Italy and southern Gaul (Marseilles) from Greece; it had no place in the oldest Roman husbandry, nor was wine used in the oldest Roman ritual. But in time Italy became a great wine country, and Cato regards viticulture as the most profitable branch of husbandry. It was indeed artificially fostered by the Roman republic, which prohibited the import of foreign growths into Italy and stimulated exports by restrictions on wine-growing in the provinces, especially in southern Gaul, which thus became a great market for Italian wines. These restrictions were not wholly removed till the time of PROBUS (*q.v.*), when the reins of empire were no longer in Italian hands. In the first century of our era Spanish and Gaulish as well as Greek wines were drunk at Rome (Pliny), but in Gaul the production seems to have been limited to the districts of the Allobroges and Bituriges on the Rhone and the Gironde. It was after Probus's time that viticulture seems to have been established on the Seine and the Moselle, and Julian when in Gaul still found occasion to discharge an epigram against the false Dionysus of Celtic beer. The northward spread of the vine was doubtless also retarded by difficulties of acclimatization, which were only gradually overcome. In the Middle Ages, when transport was difficult, wine was produced in the south of England and in several parts of Germany where there is now no motive for urging a precarious husbandry.[1] The exact mode of vine-culture and wine-making amongst the ancients is somewhat obscure; but there is reason to believe that the latter, although in a somewhat cruder form, closely resembled the system in use at the present day. As far as viticulture is concerned, we find from Pliny and others that the Romans encouraged the upward growth of the vine upon trees and palisades in preference to the dwarf system now followed in the more northern regions, such as France,—a fact doubtless attributable to the almost tropical luxuriance which the vine attains in Italy. Little comparative information can be obtained as to the style of wine made by the ancients; but from the few facts we do know it may be presumed that, apart from alcoholic qualities, the wines of Greece and Rome had not the high properties possessed by those of the present day. The introduction of resinous flavors or of salt, then usually resorted to, would hardly suit the present high rearing of vinous products. The vintage in the more favored districts began towards the end of September and in the less favored during the following month. Grapes were not gathered until they had attained their fullest maturity, and in many instances they were allowed to dry three or four days in the sun after gathering in order to obtain further sweetness and body. The grapes were trodden and then submitted to the press, much after the custom still prevalent in Burgundy and Portugal. When, however, the juice was deemed too thin and watery for the production of good wine, it was boiled down to a greater consistency, whilst a small portion of gypsum was added to it. The original receptacles for wine appear to have been the skins of animals, rendered impervious by oil or resinous substances, but later on the principal vessels were made of earthenware (amphoræ and the like) or, in certain districts, though less frequently, of wood, after the style of modern casks. In modern as compared with ancient times the wine-growing industry has considerably changed its locality. Although Italy and (in a very minor degree) Greece still produce a considerable quantity of wine, yet France, Spain, and Portugal must now be recognized as the chief homes of viticulture. France is the country whose modern agricultural history and export trade are most connected with wine production; and, although, in consequence of the *Phylloxera* and mildew, the yield has fallen off of late years, it still holds the premier position for quantity, variety, and general excellence of quality.

France.

France. It was only by degrees, owing partly to its soil and partly to the aptitude of its inhabitants, that France developed the position which it now holds as a wine-producing country. Geographically and meteorologically speaking, it is in every way eminently fitted for this. The winters are not too cold, nor, on the other hand, have the summers the intense heat and drought which are often so prejudicial to the vine in southern climates. The country is throughout of that gently undulating character which is so important for the proper exposure and ripening of the grape, whilst the calcareous properties of the soil are especially favorable to the growth of the plant. The habits of the people, moreover, and the system of small holdings have also undoubtedly done much in developing the industry; for there is, perhaps, no branch of agriculture which requires more minute attention, or for which such a system of land tenure is more suitable, than vine culture. At present throughout all France there are only ten departments in which wine is not produced,—Calvados, Côtes-du-Nord, Finistère, Manche, Nord, Oise, Orne, Pas-de-Calais, Seine-Inférieure, and Somme; and in 1887 the total production amounted to 24,333,284 hectolitres, or some 535,332,250 gallons, which, however, is considerably less than the average for the previous ten years, owing to the immense injury caused by the *Phylloxera*. In 1875, the *annus mirabilis* of wine-production in France, the yield amounted to 83,632,391 hectolitres, or nearly three and a half times that of twelve years later.

Médoc. As France is the home of wine-growing, so must the Médoc district in its turn be considered the very heart of that industry in France, for nowhere have such elegance, *finesse*, and distinct variety been obtained as on the banks of the Gironde. Unlike the products of the different vineyards of most other districts, which are purchased by the merchant and vatted to supply a general wine of commerce, the yields of the principal estates of Médoc are kept distinct, and reach the consumer as the product of the particular growth and the particular year. This practice is, almost without exception, resorted to with what are known as the classed growths and the superior bourgeois, whilst in seasons in which the wines are of good quality it is continued down to the lower grades. The area of the department of Gironde is about 2,407,000 acres, of which some 500,000 acres are under the vine. There are six descriptions of soil: (1) that of the valley, chiefly alluvial, the vines on which produce wines of considerable color and vinosity, but wanting in *finesse;* (2) the strong lands, which require freqent working and the assistance of lighter earths and manures, although, when of a ferruginous color, this soil is very favorable to the vine; (3) the marshy lands, which are of considerable extent, and which, when gravel enters into their composition, are extremely fertile; (4) lands formed at the surface of gravel, quartz, and heavy sand, with clay subsoil, over which are grown most of the finest vines of the Médoc; (5) the silicious or flinty soils, covering about one-half of the department, of which some portions, when worked with clay and calcareous elements, are suitable for vine cultivation; (6) the intermediate lands, between the strong soil and the last-named, which are chiefly available for the growth of the commoner descriptions of white wines. The principal vines used in the Médoc are, for red wines, the Cabernets (2), the Merlot, and the Malbec, and for white wines, the Semillon, the Sauvignon, and the Muscatelle. The vines of the Cabernet species, although producing excellent grapes, are especially susceptible to damage from weather at flowering time, and consequently are not so greatly used as the Merlot, which is very productive, and not so liable to attacks from *Oidium* as other descriptions. The grapes of this vine, however, have to be gathered with promptitude, as they ripen very quickly and if subjected to rain soon become rotten. The vine most generally selected, however, is the Malbec, which is a remarkably early bearer, its chief disadvantage being that it is very susceptible to frost. Of the various vine diseases and pests the chief is undoubtedly the *Phylloxera* (see VINE, p. 256 above), which was first seen in Médoc in 1869. The amount of damage caused by this insect during the past fifteen years is almost incredible, and at one time it was feared that the vineyards would be wholly destroyed. Of late, however, considerable success has been met with in checking its inroads, the area now under vine cultivation being larger than was the case when its ravages first began to make themselves severely felt. Another evil which has occasionally been very virulent is the *Oidium*, a species of fungus, which first made its appearance in France in 1851, about which time it also devastated the vineyards of Madeira. Another cause from which an enormous amount of damage has been done of recent years is the mildew, which not only destroys the leaves and fruit, but further leaves its taint on wines made from grapes affected by it. It is believed, however, that a complete cure or prevention for this pest has been found in a solution of sulphate of copper. In addition to these enemies, the vine-grower has to take account of hail, frost, and *coulure*—this last caused by too great humidity of the soil, which leads to large quantities of flowers falling from the branches before turning into grapes, and also to the grapes themselves falling. The vintage in Médoc usually commences between the middle and end of September and lasts from two to three weeks. The process is a very simple one. The grapes are gathered and brought on bullock drays to the press-house; here they are separated from the stalks and placed in vats, where they are allowed to ferment for a period of from seven to fifteen days. As soon as the wine is sufficiently made, it is drawn off into hogsheads and removed to light and airy stores. The first month the bung is put lightly in and the cask filled up every three or four days; the second month it is put in more firmly and the cask filled every eight days. In March, the lees having fallen, the first *soutirage* or drawing-off takes place. A second is made in June and a third in November, after which the hogsheads are turned on their side and the fillings-up cease. In the second and following years, after the wine has been removed to dark cellars, two drawings-off suffice, one in spring and the other in autumn. After this, if the wine ferments, it is drawn off in a sulphured cask, and if necessary fined with eggs and again drawn off in a fortnight.

---

[1] On the history of viticulture, see especially Hehn, *Culturpflanzen*, etc., 3d ed., p. 63 *sq.*, and Mommsen, *Röm. Gesch.*, v. 98 *sq.* In accordance with the history of the plant, the names wine, *vinum*, etc., are traced by philologists to *οἶνος*. The further history of the name is obscure; but it seems to be Indo-European; the Hebrew *yayin* is almost certainly a loan-word.

The great variety of qualities that the wines of Médoc possess has necessitated their classification, by which they have been divided into paysan, artisan, bourgeois, and fine growths, the last named being subdivided into five categories, and known as the "classed growths." This classification is the result of years of observation and study, going back to the 18th century, its present form being the result of a conference of brokers in 1855. Subjoined is a list of the red wines of Médoc (the English "claret"), with the names of the cantons to which they belong.

First Growths.

Château Lafitte, Pauillac.
“ Margaux, Margaux.
Château Latour, Pauillac.
“ Haut-Brion, Pessac.

Second Growths.

Château Mouton-Rothschild, Pauillac.
“ Rauzan-Ségla, Margaux.
“ Rauzan-Gassies, Margaux.
“ Léoville-Lascases, St. Julien.
“ Léoville-Poyferré, St. Julien.
“ Léoville-Barton, St. Julien.
“ Durfort-Vivens, Margaux.
“ Lascombes, Margaux.
Château Gruaud-Larose-Sarget, St. Julien.
“ Gruaud-Larose, St. Julien.
“ Branne-Cantenac, Cantenac.
“ Pichon-Longueville, Pauillac.
“ Pichon-Longueville-Lalande, Pauillac.
“ Ducru-Beaucaillou, St. Julien.
Cos d'Estournel, St. Estèphe.
Château Montrose, “

Third Growths.

Château Kirwan, Cantenac.
“ D'Issan, Cantenac.
“ Lagrange, St. Julien.
“ Langoa, “
“ Giscours, Labarde.
“ Malescot, Margaux.
“ Brown Cantenac, Cantenac.
Château Palmer, Cantenac.
“ La Lagune, Ludon.
“ Desmirail, Margaux.
“ Calon-Ségur, St. Estèphe.
“ Ferrière, Margaux.
“ Becker “

Fourth Growths.

Château Saint-Pierre, St. Julien.
“ Branaire-Duluc, St. Julien.
“ Talbot, St. Julien.
“ Duhart-Milon, Pauillac.
Château Poujet, Cantenac.
“ La Tour Carnet, St. Laurent
“ Rochet, St. Estèphe.
“ Beychevelle, St. Julien.
Le Prieuré, Cantenac.
Marquis de Therme, Margaux.

Fifth Growths.

Château Pontet-Canet, Pauillac.
“ Batailley, Pauillac.
Grand-Puy-Lacoste, “
Ducasse-Grand-Puy, “
Château Lynch-Bages, “
“ Lynch-Moussas, Pauillac.
“ Dauzac, Labarde.
“ Mouton-d'Armailhacq, Pauillac.
Château Le Tertre, Arsac.
“ Haut-Bages, Pauillac.
“ Pedesclaux, “
“ Belgrave, St. Laurent.
“ Camensac, “
Cos-Labory, St. Estèphe.
Chateau Clerc-Milon, Pauillac.
“ Croizet-Bages “
“ Cantemerle, Macau.

The average yield of the Gironde during the ten years 1876–1886 amounted to 1,435,863 hectolitres, or about 31,589,000 gallons, an average which has been placed considerably lower than that of the preceding decade by the small yields of 1881, 1882, 1884, and 1885. In each of the prolific years of 1874 and 1875 the production of the Gironde exceeded 5,000,000 hectolitres, and in 1869 it reached 4,500,000. The principal claret vintages of the 19th century are considered to have been those of 1815, '25, '28, '31, '34, '41, '47, '48, '58, '64, '69, '70, '74, and '75. From 1875 to 1882 nothing exceptional was produced. Of the vintages since 1882 it is still too early to speak, although it is probable that some of the 1884's, where they have escaped the mildew, and the 1887's will turn out well.

Sauterne.

Sauterne, or what is known as the white-wine-producing district of Médoc, lies to the south of Bordeaux; and to those who are only familiar with the Médoc vineyards it gives the impression of being quite a distinct country, having more the appearance of the Rhine provinces than of the south of France. The vintage in the Sauterne district is frequently as late as the end of October, and in some cases does not take place until November. The method followed differs from that of Médoc, the grapes being gathered almost one by one, and not until they have almost assumed the appearance of rottenness, or extreme ripeness, so that in fact fermentation has commenced before the fruit is taken from the plant. The Sauterne grapes are white and of medium size, and yield a must which does not lose the whole of the sugar during fermentation, but remains sweet without the addition of spirit. In gathering the grapes, it is customary for women to cut off with scissors the berries as they ripen, the vintage thus lasting over a considerable time. The grapes, moreover, are not put into vats, but are carefully pressed and the juice put into hogsheads, while the fermentation completes itself. The first result is a very sweet luscious wine, known as the *tête*, which is chiefly sent to Russia, where it makes enormous prices. Following this a second wine, of a drier character, called *millieu*, is made from the less saccharine grapes, this being the class of wine generally known as Sauterne. There is also a third process, in which all the remaining grapes are mixed together and pressed, the result being called the *queue*. In the preparation of the better class wines for the English market the three varieties are usually mixed in certain proportions, so that the wine sent to the United Kingdom is very different from the oily liqueur-like article which is in such favor in the colder climate of Russia. As a rule all the finer descriptions are put into bottle before shipment, the corks bearing the name of the château and the vintage, as is the case with the château-bottled red wine. The character of Sauterne may be best described as being, in good years, very luscious and yet very delicate, and possessing a special *sève*, or, in other words, having that special taste, which, while it remains in the mouth, leaves the palate perfectly fresh. The Sauterne district comprises the communes of Sauternes, Bommes, and Barsac, with part of those of Preignac, Saint-Pierre-de-Mons, and Fargues. The finer growths, like the red wines of Médoc, are arranged in classes, in the following order:

Grand First Growth.

Château Yquem, Sauternes.

First Growths.

Château La Tour Blanche, Bommes.
“ Peyraguey, Bommes.
“ Vigneau, “
“ Suduiraut, Preignac.
“ Coutet, Barsac.
Château Climens, Barsac.
“ Bayle (Guiraud), Sauternes.
“ Rieussec, Fargues.
“ Rabaut, Bommes.

Second Growths.

Château Myrat, Barsac.
“ Doisy, “
“ Peyxotto, Bommes.
“ D'Arche, Sauternes.
“ Filhot, “
“ Bronstet-Nérac, Barsac.
Château Caillou, Barsac.
“ Suau, “
“ Malle, Preignac.
“ Romer, “
“ Lamothe, Sauternes.

The prices of the "grand" Sauterne wines vary enormously according to the year, the quality of which is also very various. Between 1870 and 1885 the first growths have ranged from £8 [$38.88] to £60 [$291.60] per hogshead. Château Yquem in the ordinary way fetches from one-fifth to one-fourth more than the other first growths, whilst a rather greater difference rules between the first and second growths. There is, however, no positive rule in this respect; for if, as occasionally happens, a first growth is vintaged a little too late and does not succeed so well as some second growths, the latter will fetch quite as high, if not higher, prices.

Champagne.

Champagne takes its name from the old province which is now represented by the departments of Marne, Haute-Marne, Aube, and Ardennes. It is from the first two that the greater portion of this description of wine is derived, the best qualities being produced in Marne. The vineyards are situated on the banks of the river in the neighborhood of Épernay, and extend from the right bank over the mountains of Rheims to the vicinity of that city and from the left bank to the small town of Vertus. Of those near the river the principal are at Ay, Dizy, Hautvillers, and Mareuil on the right bank, and at Pierry and Moussy on the left, whilst in the district reaching to the south of these are those of Avize, Cramant and Vertus. The vineyards of the mountain include those of Verzenay, Sillery, Rilly-en-Montagne and Bouzy. The sparkling champagnes are made from both white and red grapes, carefully pressed, and the wine is of an amber color, more or less deep according to vintage and to the proportion of black grapes used. The grapes are pressed in a large *pressoir*, the first pressing yielding the best quality, whilst the second and third are proportionately inferior. The wine from the first pressing is about equal in quantity to that of the other two combined. The vintage usually takes place in the first week in October, the young wines being left to ferment in the cask until the winter, when the first racking takes place, which operation is repeated a month later, when the wines are fined previously to being put in bottle. The wines of the various growths are mixed in the proportions desired, and a certain quantity of old wine (preserved in cask) is added. The amount of saccharine in the wine is also ascertained, and if deficient the requisite quantity in the form of refined candied sugar is added to bring it to the necessary degree for producing fermentation in the bottle. The bottles, which are carefully selected,—those showing the least flaw being rejected,—have sloping shoulders, in order that the sediment may not adhere to the sides in the after-process. The wine, after being corked, is secured by an iron clip, and the bottles are arranged in piles in a horizontal position in which they remain throughout the summer months. During this time the carbonic acid gas is generated, as is also a sediment, which falls to the side of the bottle. The wines are then stacked away in cellars until required for shipment. Previous to the wine being prepared for this purpose, the bottles are placed in a slanting position, neck downwards, in cranks made in the shape of the letter A, and are daily shaken very slightly, so that by degrees the sediment falls into the cork. This operation is very delicate the slightest twist being disastrous. The incline is gradually increased, so that at last the bottle is almost perpendicular,—a process which generally takes from three to six weeks. With the sediment thus on the cork, the iron clip is removed, when the force of the wine sends out the cork together with the sediment. The wine is now subjected to *dosage* or liqueuring, the amount of which depends upon the sweetness required; the bottles are then filled up with wine, corked, and wired ready for shipment. The liqueur used is made from the finest wine, candied sugar, and cognac, the usual amount of which for wine sent to the United Kingdom is from one to four per cent. For colder countries the percentage of liqueur is much greater, in some cases exceeding twenty per cent. The liqueuring is regulated by a machine, by which the quantity is measured to a nicety; but in some establishments it is still measured by hand with a small ladle. The principal centres of the champagne trade are Rheims and Épernay, although important establishments exist at Ay, Avize, Châlons and Dizy. The total production of Marne averages about a million hectolitres annually. A large proportion of this, however, is unsuited for making champagne. At the same time the supply is still considerably in excess of the demand, the stock in merchants' cellars in the district having amounted in May, 1887, to upwards of 82,000,000 bottles, whilst at least half that quantity existed in cask, the total stock thus equalling nearly six years' requirements.

Saumur.

Another district of France which produces large quantities of sparkling white wine is that of Saumur, in the department of Maine-et-Loire. These wines have been known for centuries, but up to 1834 were only used as still wines. At that date a successful attempt was made to convert them into sparkling wines, after which they were principally used to supplement the deficient vintages in Champagne. In 1874 sparkling Saumur was introduced into the United Kingdom in its own name, and has since made considerable advance in the English market, owing mainly to its good quality and its moderate price. It has a great resemblance to the wines of Champagne, and is very fine and wholesome; and, although it lacks the body and *finesse* of the best growths of Marne, it compares very favorably with the lower grades of these wines, and is also much lower in price, the best descriptions being obtainable by the English consumer at little more than three shillings [73 cts.] a bottle. The judges of taste and analysis at the Paris exhibition in 1878 gave the following award: "The wine does not differ from Champagne in respect of sweetness and lightness; it is equally white, clear and sparkling. It contains in nearly the same proportion the same substances as the wines of Champagne." The town of Saumur is situated on the banks of the Loire and at the foot of a commanding range of hills, to which latter fact the country in a great measure owes its success as a producer of sparkling wines, as the hills furnish, at a trifling cost and in excellent quality, mile upon mile of the excellent cellarage which is indispensable to their preparation. These cellars are excavations in the hills from which the limestone has been taken, and possess the advantages of easy access and even temperature. The best wines of the district are made from black grapes pressed *en blanc*, as in Champagne, the usual variety of vine being the Breton. The white grapes employed are the *Pineau blanc*, which are vintaged a full fortnight later than the red grapes. According to the system of manufacturing sparkling Saumur one-half of each year's must is put into barrels by itself to ferment and become wine, and is kept to be mixed with one-half of the next year's must. In the following May the mixture is put into bottles to undergo its second fermentation, which is induced in the same manner as in champagne, the wine being treated in precisely the same manner. The sediment is also worked into the neck in a similar way, and is thrown off by the system of disgorgement. The average yield of Maine-et-Loire for the ten years ended 1887 was about 11,990,000 gallons.

Burgundy.

Next to those of Médoc, the wines of Burgundy are the best French red wines known in England. This district comprises the departments of Côte-d'Or, Yonne, and Saône-et-Loire, known in former days as Upper and Lower Burgundy. By far the finest qualities are grown in Côte-d'Or, in the two communes of Nuits and Beaune. The former lies in the neighborhood of Dijon, and comprises some of the choicest growths, merging into Beaune in the south, which in its turn adjoins the Mâcon district, in the department of Saône-et-Loire. The wines of Côte-d'Or are grown on the slopes of a range of hills which traverses the department, the best vineyards lying about half-way up the side, where they get the full rays of the sun, the vine apparently deteriorating as it is planted above or below this altitude. As in the case of Médoc wines, the best growths are kept distinct and have a high reputation. The usual classification is as follows:

Red Wines.

Class I.—Romanée-Conti, Chambertin, Clos Vougeot, Richebourg, La Tâche.
Class II.—Musigny, Romanée-St.-Vivant, Le Clos Saint-Georges, Le Corton, Les Bonnes Mares, Le Clos du Tart.
Class III.—Arvelets, Rugiens, Beaumont, Cailles, Cras-
Class III.—*Continued.* Murge, Boudots, Porrets, Prullers, Thaurey, Vaucrains, Cailleret, Champans, Clavoillon, Clos Margeot, Clos Tavannes, Noyer, Bart, part of Corton, Échezaux, Fèves, Grèves, Ferrière, Sautenot.

White Wines.

Class I.—Montrachet.
Class II.—Chevalier Montrachet, Bâtard Montrachet, Charmes, Combettes, Gen-
Class III.—*Continued.* evrières, Goutte d'Or, Charlemagne.

The wines of Côte-d'Or are full-bodied and of excellent color; they are of great reputation on the Continent, especially in Belgium, although till recently not so well known in England, owing to the difficulty experienced in keeping them. But this drawback has now been removed by increased care in their treatment, and by a system of freezing in the young wines, by which a quantity of the natural water is removed and the alcoholic strength of the remainder thereby increased. One of the principal features of the Côte-d'Or is the Hospice de Beaune, a celebrated charitable institution and hospital, the revenues of which are principally derived from certain vineyards in Beaune Corton, Volnay and Pommard. The wines of these vineyards are sold every year by auction on the first Sunday in

Chablis.

November, and the prices they make serve as standards for the various growths of Burgundy. In Yonne, lying to the northwest of Côte-d'Or, a considerable quantity of wine is made, both red and white. The former has good color and body, with a fair bouquet, but is much inferior to the wines of Burgundy proper. The latter, grown mostly in the commune of Chablis, is of fair quality and is generally known by the name of this district.

Mâcon.

Saône-et-Loire, which lies to the south of Beaune, produces the wine known as Mâcon, grown in the neighborhood of that town, the best growths being those of Théorine. The wines of Mâcon have most of the Burgundy characteristics, but are lighter in color and body, and lack much of their bouquet and flavor.

Hermitage.

Red and white wines are produced in the arrondissement of Valence in the department of Drôme. These wines are of excellent quality and improve greatly in bottle, in which state they will keep for many years. The white wines are especially choice, and have a far greater reputation than the red. They are soft and rich, and are said to have no analogy to any other white wine known.

Charente.

The departments of Charente and Charente-Inférieure, although their wines are unknown in the United Kingdom, are celebrated on account of the brandy distilled from them. This industry has suffered enormously of late years from the ravages of the *Phylloxera*, which has destroyed many of the best vineyards in the neighborhood of Cognac. The wines of the district are in themselves common and of little use but for the still, for which purpose they cannot be approached by those of any other department. But the proportion of wine required to make brandy is so high that, unless it can be produced at a moderate price, the cost of the spirit becames enormous; hence the proprietors have been unable to obtain a sufficiently high price for their wines to make it worth their while to incur the cost of resisting the plague, and consequently a large quantity of vine-land has gone out of cultivation. In 1874 the produce of the two departments amounted to over 250,000,000 gallons, whereas that of 1887 was little over 14,000,000 gallons. During the last two or three years re-planting has been diligently carried on.

The above constitute the principal varieties of French wines known in the United Kingdom; they form, however, but a small fraction of the entire production of the country. Enormous quantities are produced in the southern provinces, but they are of a commoner description and are reserved for home consumption. Thus in 1887 the two departments of Aude and Hérault yielded between them 5,643,832 hectolitres, or about 124,160,000 gallons, which was considerably in excess of the total produce of the districts previously alluded to. In the department of Pyrénées-Orientales, in the old province of Roussillon, a full-bodied and deep-colored wine is produced, a small portion of which is sent to Great Britain and is of a better quality than most southern growths. This wine is known by the old name of the province and is of considerable value for blending light thin wines. There are also some very fair wines made in the department of Jura and in the district lying east of Burgundy.

Algeria.

Algeria.—Owing to the devastation caused by the *Phylloxera* in France much attention has of recent years been bestowed on vine culture in Algeria. The result of the first experiments has been very encouraging. M. Bouchardat in a recent report to the Medical Society of Paris wrote: "In the not very distant future by means of the vine we may look for the definite conquest of Algeria. Through its cultivation new colonists will be brought into the country and the habit of labor and its accompaniment, wealth, will result both for them and for the natives. It is through the cultivation of the vine also that we may hope to remove the greatest present obstacle to progress in Algeria, viz., the unhealthiness of the marshlands; for in reality on all the soils where the vine is cultivated we soon see those conditions disappear to which intermittent fevers owe their origin." Algeria undoubtedly possesses soil and climate suitable to vine culture; in fact, the vine seems almost to grow at will and is productive in the third year after being planted. The laying out of vineyards is consequently proceeding very rapidly, and considerable improvement by means of skilled labor is becoming noticeable in the making of the wines. The wines of Algeria resemble that of Roussillon in general character, being full-bodied, with good color and alcoholic strength. The greatest quantity is produced in the province of Algiers, although there is a considerable yield in the provinces of Constantine and Oran, the latter being cultivated principally by Spaniards.

Spain.

Spain is second only in reputation to France among wine-growing countries. Its white wine, known as sherry, first brought it into prominence; and the red wines of Tarragona and Rioja have of late years formed a great feature in the commerce of the Peninsula. The reduced yield of the French vineyards, especially of those producing the cheapest wines, owing to the ravages of the *Phylloxera*, combined with an increased home consumption, has compelled that country to import large quantities of wines for its own use, and Spain has taken a foremost place in supplying the demand which has thus sprung up. In addition to this, a considerable quantity is exported to other countries, Great Britain amongst the number, in the shape of Spanish claret and port, which are perhaps of as good an intrinsic value as any that reach the United Kingdom. The wines of Andalusia naturally claim a priority in description.

Sherry.

Sherry, so called from the town of Jerez (Xeres) de la Frontera, the headquarters of this industry, is produced in Andalusia in the area included between San Lucar in the north, Port St. Mary in the south, and Jerez in the east. This tract of country contains in all about 25,000 acres of vine-growing soil. The system of preparing sherry is different from that followed in the case of most other wines. In France, every small grower can make his few hogsheads of wine, and when these have been made the process is complete. In Jerez, on the contrary, the immense establishments, many of them owned by Englishmen, purchase the grape juice or fruit and make their own must. The wines, which are stored in *bodegas* or sheds above ground, are reared for a number of years as *soleras*. These *soleras* consist of vats of various characters of sherry, the style of which is unvaryingly kept up, and whenever a quantity is drawn off they are filled up with wines of the same description. Certain quantities taken from various *soleras* are blended in order to make up the regular marks, by which means the style of different shipments is maintained. There are several different varieties of sherry known in the United Kingdom, which may be divided into the Amontillado and the Manzanilla classes. The Amontillado class may be again subdivided into Fino and Oloroso, the former being the more delicate; frequently the two descriptions are different developments of exactly the same wine. The Manzanilla wines are very much lighter and drier, and are the produce of vines grown on the coast. In making up the marks for the different markets several varieties of sweetness and color are required. These are obtained by the addition of *vino dulce* made from grapes which are allowed to grow dead-ripe, and of coloring matters made from wine boiled down almost to a liqueur. A certain amount of grape spirit is added to check the tendency to re-fermentation. This system applies only to the Amontillado class. The Manzanillas are mostly shipped in their natural state, with spirit added in small quantities only where it is feared that the wines will otherwise not be able to stand the journey. This description of wine, however, has not hitherto been in great demand in Great Britain. In addition to Manzanilla, there is another description of somewhat similar wine, but with less characteristic taste and somewhat more body, known as Montilla; it is grown in the province of Cordova. Yet another description of wine grown in the vicinity, on the right bank of the Guadalquivir, is that known as Moguer, which resembles a cheap sherry, and is only used for blending with the commonest qualities. Of late a large quantity of this wine has found its way to France to assist in making a cheap wine for the French consumers. Other districts in the south of Spain well known for the production of wine are those of Malaga and Rota. The former yields a sweet description, principally made from Muscat grapes, although a coarse drier wine of the sherry type is also produced. The Rota district is known principally for a sweet red wine, known in England as "tent" (*tinto*), mainly used for ecclesiastical purposes.

Montilla, Moguer, etc.

Val de Peñas.

The central districts of Spain also produce some good red wines suitable for exportation, such as Val de Peñas, which have moderate color and considerable strength, and are said to be the produce of vines brought from Burgundy. The name Val de Peñas, however, is often given also to wines grown in the neighboring districts. The system of storing these wines is very similar to that mentioned by Horace in connection with Falernian, and is still practiced at Montilla. The wines are placed in large earthern jars (*tinajas*) like Roman amphoræ, which are prepared inside with a kind of varnish with a view to the preservation of the wine.

Leon and Old Castile in the northern and central parts of Spain furnish about one-half of the wine grown in the entire country. On the border of this region is the rich and fertile district of Rioja (Logroño), which has a climate

Rioja and Tarragona.

admirably suited to the production of wines of moderate strength. The wines of Navarre are more full-bodied and have more color and alcoholic strength, but owing to want of care in their production are less suitable for exportation. In Catalonia, there is a much more important wine industry, the district producing what is known in England as Tarragona or Spanish red. The best quality produced is the wine of the Priorato district (about fifteen miles inland from Tarragona), which is very rich and full-bodied, and keeps well. Unfortunately this particular area, which is chiefly mountainous, is limited. The next description to this is the wine of Huesca, which is also fine-colored and full-flavored. The wines of Aragon are also good, but require special care owing to their liability to a second fermentation. The best growth is that of Cariñena (Zaragoza). The greater part of the Spanish wines imported into France are supplied from Catalonia and Aragon. A French authority on the subject states that "of all the towns in Catalonia which supply wines to France Manresa is in reality the one which, for several years, has sent the largest quantity. This region enjoys a climate more temperate than that of Roussillon, and from hence are derived three-quarters of the wine shipped to France from Barcelona. Hence may be found all types of wines, including dry white and natural red."

Canary wine.

The only islands of the Canary group on which vine culture is now carried on on a commercial scale are those of Gran Canaria (Grand Canary) and Teneriffe, for although a certain amount is produced at Palma it is all used for local purposes. On the two first-named islands the industry has fallen away of late, owing to the attacks of *Oidium*, which destroyed the vines at about the same period as in Madeira. Since then, the islands have been chiefly devoted to the production of cochineal, until the recent discovery of aniline dyes, which has, to a great extent, ruined the industry, and again led the inhabitants to turn their attention to vine culture. This has been especially the case in Gran Canaria, where a considerable area of ground is now planted with vines, and a fair return of wine is obtained. These are being treated similarly to those of Madeira, which they greatly resemble in character. In Teneriffe a wine known as Vidonia, which is of a somewhat similar type, is produced, and is exported in small quantities. Vine-growers in this island adhere more to the methods in vogue in Spain.

Portugal.

Port.

The generous full-flavored wines known as port are the produce of the district of Alto Douro in the northeast of Portugal, which begins at a point on the river Douro some 60 miles above Oporto, whence these wines are shipped. The whole of the port-wine district, comprising a region between 30 and 40 miles in length with a maximum breadth of about 12, is rugged and mountainous, necessitating the construction of terraces supported by walls, without which protection the soil would inevitably be washed away by the winter rains. The climate of Alto Douro is very cold in winter and extremely hot in summer (frequently 108° Fahr. in the shade). It is owing to this intense heat combined with the peculiar richness of the soil, which is of argillaceous schist formation, that port wines attain to such perfection of color, body, and ripeness. Till quite recently the means of communication between Oporto and Alto Douro were extremely limited. Roads in the district itself there were none, or very few, and the only way of getting the produce to the port of shipment was by the river, the navigation of which, at all times difficult and even dangerous, on account of the numerous rocks and rapids which obstruct its course, is often rendered impossible by freshets. The Douro railway, however, now traverses the whole length of the wine country along the river bank from Oporto, and other lateral railways are in course of construction which will open up several fine wine-producing districts hitherto unavailable owing to want of roads.

Cultivation of the vine for port.

The method of cultivating the vine in Alto Douro differs considerably from those employed in various other parts of the country, where the vines are either trained over pollarded trees or treillaged at a certain height from the ground, or where they are planted in rows and grown like bushes. The method is as follows. In November or December trenches are dug, 3 feet to 3 feet 6 inches deep, according as the soil is heavy or light, and 2 feet broad, in which vine cuttings are placed at a distance of 3 feet to 4 feet 6 inches apart from each other. The trenches are then partly filled in, in order that the vines may get all the benefit of the rain-water collecting in them. During the first year of planting great care is taken to keep down all weeds whilst the vines are shooting. At the end of two years the young vines, if they have come on well, can be grafted, the best time for performing this operation being October or February; in this way the period of production is hastened, and the vineyard will yield in four instead of five years' time. Should some of the vines die, their places are usually supplied by the process called *mergulho* or layering: that is, a trench is dug in the direction of the space left bare and in it the stock of the nearest vine is turned down. The trench is then partly filled in, leaving two or three shoots of the buried vine visible to the extent of a couple of "eyes" above the surface, which shoots are to take the place of the missing vines. There is also the system of planting from nurseries, which are made with either Portuguese or American varieties. The plot of ground used for the nursery must be kept well clear of weeds and, if in a dry situation, well watered. In two years' time and during the month of February the young vines can be transplanted, and the year after grafted, when the vineyard is planted. The first of the regular operations in the course of cultivation is to clear away the soil from the feet of the stocks, which takes place directly the vintage is over. At the same time manure may be given, and, if the vines are strong enough to bear the application, sulphate of carbon may be injected, on account of the prevalence of *Phylloxera*. After this the vines are pruned. In March the first annual turning of the soil takes place; then the branches of the vines are tied to stakes or canes, in which process considerable skill is brought to bear so as to make the vine shoot in the required direction. Immediately after or about the time they blossom the vines are sulphured, to keep off the *Oidium*, which disease is still active in Portugal; and lastly in June the soil is hoed over to destroy the weeds. The turning of the soil, which is effected with an implement resembling a two-pronged hoe, and the cultivation of the vineyards generally, are to a great extent performed by laborers (*Gallegos*) from Galicia in Spain, but at vintage time *serranos* from the neighboring *serras* also flock in to work.

Vintage in Alto Douro.

The vintage in Alto Douro generally commences late in September. The grapes are cut by women and children, and are conveyed in large baskets—twenty-two of which full of grapes will yield a pipe of wine—by Gallegos to the place where the wine is to be made. Here they are emptied into large stone tanks, 2 feet to 2 feet 6 inches in depth, each holding from seven to thirty pipes of wine. Each tank is fitted with a beam press, except where the modern screw press has taken its place. As the grapes come in, the stalks are removed, either with a kind of rake or, as in the best managed establishments, with machines called *desingaçadores*, made for the purpose. The white grapes are separated from the red, the "white port" being made from the former; this wine was formerly much appreciated in England, but now finds its chief market on the Continent. When the tank is full, a number of men and sometimes even women, begin the process of treading, which is continued for about forty-eight hours; after that the must is left to ferment by itself. When the weather has been cold or the year a very ripe one, it has sometimes been found necessary to give as much as seventy-two hours' treading; nowadays, however, there is seldom need for so much work. When the must has sufficiently fermented, it is drawn off into huge vats, holding as a rule about twenty-five pipes each; at the same time sufficient alcohol is added to prevent acetous fermentation and retain part of the sweetness of the grape. Formerly the drawing-off of the must from the tank was determined simply by taste or judgment, but of late years the saccharometer is employed to decide when the must has reached the requisite degree of sweetness. The wines are left untouched in the vats till the cold weather causes them to deposit the lees, when they are racked, and at the same time another small addition of brandy is made. The brandy used is with hardly any exception simply distilled wine, and is of very fine quality. About March or April the wines are again racked from their lees into casks, and are sent down either by boat or rail to Oporto, where they are stored in most cases for a considerable number of years previous to being shipped. The cheaper wines are an exception, being as a rule shipped when young, also those of the so-called "vintage" class, which are the finest wines of a good year kept separate and shipped as the produce of that particular year. The following is a list of the most famous "vintages" of the 19th century—1809, '12, '15, '20, '27, '34, '40, '47, '51, '63, '68, '70, '73, '78, '81, the last year when the wine was shipped as a vintage being 1884. The stores or lodges where the wines are warehoused are chiefly situated on the Villa Nova side of the river, facing Oporto, and generally speaking comprise a series of long one-storied stone buildings, with thick partition walls and heavy tiled roofs. The wines are kept in casks ranged in rows of two or three tiers; in some establishments large vats, holding from 10 to 110 pipes, are also used, being especially serviceable for blending purposes. The amount of wine contained at the present day in these lodges is calculated at something like 80,000 pipes, the gross value of which cannot be less than two and a half or three million pounds sterling [$14,580,000], by far the greater part of this sum representing English capital.

Port-wine trade.

The chief market for port wine is, as it always has been, England. Its introduction into England, which was the beginning of the trade in these wines, dates from the end of the 17th century. At first the exportation was small, the annual average for the first ten years being just over 600 pipes. The consumption, however, gradually increased till 1753, when, owing to adulterations and various other causes, port wine fell into disrepute, and the shipments receded to a very low figure. The prices of new wine to the farmer at this time varied between £2 [$9.90] and £3 [$14.75] per pipe, whilst the shipping prices for old wine did not exceed £9 [$44.55]. To remedy this state of things the Old Wine Company was established in 1756 by the marquis of Pombal. The first act of the company was to make an arbitrary circumscription of what they considered the viticultural region of Alto Douro, outside of which no vines could be planted. The territory within the limits of the demarcation was then divided into three districts,—(1) that producing the factory wines, *i.e.*, those set apart for England, (2) that whence the supplies for the Brazils were drawn, and (3) that the produce of which was reserved for tavern use or distillation. For all the wine allowed to be exported permits were issued, without which not a single cask could be sent down to Oporto for shipment. Later on, however, these permits were openly sold in the market, fetching as a rule about £3 [$14.75]. The inconvenience and damage to the trade resulting from these absurd regulations led to the abolition of the company in 1833. But in 1843 the creditors of the Old Wine Company, whose lodges, with their valuable contents, had been destroyed at the raising of the siege of Oporto by the retreating Miguelites, induced the Government, as an indemnity for their losses, to re-establish the former company's monopoly. The new company had no authority to prevent the planting of vines; but their powers as to the classification and exportation of port wine were the same as those possessed by the old company. For instance, in 1848 over 11,000 pipes were produced, but only 7000 were approved for exportation to England. At this time the export duty on wine destined for England was £3 [$14.58] per pipe—in reality £6 [$29.16] if the £3 [$14.58] permit is taken into consideration, whilst that on wine destined for countries out of Europe was only 6d. [12 cts.] per pipe. The consequence was that considerable quantities of wine were shipped to America and thence to England, the difference in the duty just paying expenses with a slight profit to the shipper. This state of things lasted till 1853, when the company was finally "exonerated from its official duties" and the export duty equalized on wine to all countries. Since that time the port-wine trade has been entirely unrestricted.

Ravages of *Phylloxera* and *Oidium*.

Besides the curse of monopolies, Alto Douro has suffered severely from the *Oidium* and *Phylloxera*. The former appeared about 1848, but it was not till 1853 that the disease assumed serious proportions. The climax was reached in 1856, when only 15,000 pipes were vintaged, about one-sixth of the usual quantity. At one time it seemed as if the whole trade would collapse, as the exportation dropped from 41,621 pipes in 1856 to 16,696 pipes in 1858. Fortunately, however, the sulphur remedy was discovered and applied in time, and since then the *Oidium*, though not entirely got rid of, has at any rate been effectually prevented from doing much harm. The same, as yet, cannot be said of the *Phylloxera*, the ravages of which have been much more serious. Its presence in Alto Douro was suspected as early as 1868; but for years hardly any attempt was made to save the vines, owing to the incredulity of the large farmers, who considered the cause of the withering of their vines to be the continuous drought of successive dry seasons. More energetic efforts are now being made to cope with the disease; but in the meantime the yield has been getting less year by year, and at the present time is little more than half what it used to be during the three years previous to the appearance of the *Oidium*, when the average was over 100,000 pipes. The excess of exportation over production for the last few years is owing, in the first place, to the enormous increase in the Brazilian trade, which is largely made up of wines from the Minho and Beira districts, and, secondly, to the new trade in common country wines with France. The shipments of wine of all kinds from Oporto to the Brazils amounted during 1887 to over 25,000 pipes, whilst those to France exceeded 10,000. According to the latest accounts, the *Phylloxera* still continues to extend the area of its attacks, although, on the other hand, many of the abandoned vineyards are again being brought under cultivation; also the number and extent of the new plantations are steadily increasing.

Statistics of port-wine trade.

Exportation of wine from Oporto from 1678 to 1756, when the Wine Company monopoly was established: 1678–87, average 632 pipes per annum; 1688–97, 7668; 1698–1707, 7188; 1708–17, 9644; 1718–27, 17,692; 1728–37, 19,234; 1738–47, 18,556; 1748–56, 16,354. Total, 953,362 pipes. Total exportation of wine from Oporto from 1757 to 1833, or during the existence of the Wine Company monopoly, 2,564,096 pipes. Average to Great Britain, 27,938 pipes; to rest of the world, 5362. Total, 33,300 pipes. Total exportation of wine from Oporto from 1834 to 1842 during the absence of restrictions—to Great Britain, 233,469 pipes; to continent of Europe, 11,980; to rest of the world, 41,600; total, 287,049 pipes. Average to Great Britain, 25,941 pipes per annum; to continent of Europe, 1331; to rest of the world, 4622. Total exportation of wine from Oporto from 1843 to 1853 during the existence of the New Wine Company monopoly—to Great Britain, 272,799 pipes; to continent of Europe, 47,271; to the rest of the world, 75,197; total, 395,267 pipes. Average to Great Britain, 24,800 pipes per annum; to continent of Europe, 4297½; to rest of the world, 6836.

TABLE III.—*Exportation of Wine from Oporto from* 1854 *to* 1887, *during the absence of restrictions and equalized rate of export duties to all parts.*

Lisbon wines.

In addition to port, a large quantity of wine is produced in other districts of Portugal, notably in the neighborhood of Lisbon. Of these the principal are Torres Vedras, to the north of the city, where a large quantity of red wine of a coarse claret type is grown; Collares, the vineyards of which lie beyond Cintra, and where a higher class is produced; Carcavellos, at the mouth of the Tagus; and Bucellas, in which a white wine is produced from the Riesling grape, known in the United Kingdom as Bucellas hock. Carcavellos yields a fuller-bodied description, which savors more of the Madeira type.

Madeira.

There is every reason to believe that wines were introduced into Madeira soon after the discovery of the island. But it was not till some 200 years later, after the marriage of the infanta Catherine of Portugal with Charles II. of England, that British merchants established themselves at Funchal, from which point the wine trade of Madeira commenced. The system of cultivation is somewhat peculiar. The vines are trained over a lattice-work of cane, about 4 feet from the ground, supported on stakes, thus giving room for the vine-dresser to pass underneath and keep the ground clear from weeds. This system of keeping the ground clear and moist has much to do with the excellent character of the wine produced. An English acre can yield about seven pipes (644 gallons), but the average is considerably below this quantity. The vintage commences as a rule about the last week in August, and the grapes are all pressed before the October rains set in. This latter operation is still carried out in the primitive fashion, the fruit being thrown into large presses and trodden with the naked feet. Madeira wine improves much with age, and is occasionally to be met with from fifty to a hundred years old. The choicest descriptions are Malmsey, Sercial, Bual, and Tinta. The Jesuits at one time contrived to hold the monopoly of the Malmsey wine, and were owners of the vineyards at Cama de Lobos, in which it was produced. Of the other wines the choicest are found on the south side of the island; but here as the elevation above the sea increases the quality falls off. The grapes from which Malmsey is made are not gathered till a month later than those for other wines of a drier character. Sercial is also a much-esteemed wine; it is said to combine all the attributes of a perfect wine, being full-bodied and having a rich aromatic flavor peculiar to itself. The grape from which it is produced is of the Riesling variety, and is supposed to have been transplanted from the banks of the

Rhine. Bual is a very luscious wine, the produce of a white grape. Tinta, on the other hand, is obtained from a red grape, and has somewhat of the character and appearance of the wines of Burgundy, whence the vines are said to have been derived.

Trade in Madeira.

Madeira wine became well known in England about the middle of the 18th century, when it became fashionable, owing to the strong recommendation of officers who had served in the West Indies and America. The great demand at the beginning of the 19th century caused the culture of the vine on the island to be greatly increased. The annual production must ultimately have reached over 30,000 pipes, larger quantities of the commoner sorts being consumed on the island or turned into brandy. So much of the land indeed was under the vine that nearly all bread-stuffs had to be imported, the corn grown on the island being at that time only equal to three months' consumption, whereas now, owing to the decreased number of the vineyards, it grows an amount equal to nine months' requirements. In evidence of the importance which at one time attached to the Madeira wine trade, it may be mentioned that in 1799 a fleet of ninety-six ships was convoyed from Portsmouth to the port of Funchal by three men-of-war. This fleet took on to the West Indies 3041½ pipes of Madeira, partly for the supply of the West Indian colonies and partly shipped for the voyage there and back to England. For many years this practice of sending wine for a voyage to the East or West Indies and back has existed amongst the Madeira merchants. The voyage matures the wine, and at the same time gives it a peculiar bouquet and flavor, derived most probably from the intense heat of the ship's hold and the continual motion to which it is subjected. There is, however, a marked difference between wines shipped to the East and those sent to the West Indies, the only reason assignable being the difference in the length of the voyage. A custom prevails of submitting the wine, shortly after its manufacture, to a high temperature in buildings especially designed for the purpose, the result of which is the earlier development and mellowing of the wine, and the prevention of re-fermentation. The exact temperature to which the wines are thus subjected and the length of time depend on individual judgment, although the temperature never exceeds 130° to 140° Fahr. for inferior and 100° to 120° for better class wines. It is this process which gives Madeira its characteristic flavor, to which again its popularity in Great Britain is due. The large stone buildings, two stories high, in which this process is carried on are divided into compartments and heated by flues with hot air from stoves below. On the wines being removed after a lapse of three, four, or six months, as the case may be, they are fined and racked, a second proportion of brandy being added if necessary, and they are then left to themselves, except for an occasional fining and racking, until they are shipped, which scarcely ever takes place before the second or third year.

As long ago as 1785 the quantity of Madeira shipped to England was 120,000 gallons, which gradually increased up to 1820, when it reached 520,000 gallons. After 1852, however, this amount was greatly reduced, and, although it has again improved of late years, the quantity imported in 1885 was only 108,771 gallons. With reference to the wine trade of Madeira with all parts of the world, it appears that in 1646 as many as 2000 pipes were exported. About this time English and other foreign houses established themselves in Funchal, and it is without doubt owing to them that the culture of the vine was increased and an export trade of some importance commenced. It was not, however, until the latter half of the 18th century that, in consequence of the wars between France and England and the closing of the French ports, the Madeira trade increased to large proportions. In 1774 some 7000 pipes were shipped, which by 1780 had increased to over 16,000. In 1813 it is said some 22,000 pipes of Madeira were exported, at an average price of 300 dollars per pipe. After the war the large convoys to the East and West Indies ceased, but the Indiamen still called at Madeira on their outward voyage. Nearly all the regimental messes in the East Indies were supplied with Madeira wine, whilst large shipments were also made to America, Russia, and Germany. The taste for Madeira has of late very much died away, the cause of which must be traced to the appearance, in the spring of 1852, of the *Oidium Tuckeri*, which devastated the vineyards of the island. Vines were rooted up and sugar-canes planted in their stead, whilst, with production practically at a standstill, holders refused to part with their wines except at enormous figures. In consequence of these high prices Madeira was soon placed beyond the reach of all but the wealthiest classes. When in the course of time a cessation of the disease came about, the Madeira vineyards began to be replanted, so that the production of the island has again reached some 5000 to 6000 pipes annually, and brought about a corresponding reduction in price, genuine wine being now obtainable at considerably less than £20 [$97.20] per pipe. Popular prejudice is in consequence being removed, and a gradual although slow revival in the Madeira trade is taking place.

Italy.

Italian wines.

In point of quantity of production, though far inferior in quality, Italy ranks ahead of France. The estimated area under the vine is in excess of that of France. The annual yield is some 660,000,000 gallons, valued at about £100,000,000 [$486,000,000]. Whereas in France and Spain the acreage under the vine is devoted exclusively to that plant, the vine in Italy is grown simultaneously with the olive, corn, etc. The vines are simply trained on wires at some distance from the ground, and are frequently allowed to run from tree to tree, mingling in the general vegetation, nature doing so much for the vine-grower that he, in most instances, does but little to assist her. The vintage usually takes place in September and October, and, except in Sicily and some of the Southern provinces, the system employed is somewhat rude in comparison with those of other nations. Yet considerable improvement has taken place during the last few years. Greater attention is being paid to the selection of suitable plants, whilst on the larger estates modern wine-presses and utensils are coming into use, and the necessity of care and cleanliness for the production of good wine is beginning to be better understood. Amongst the chief faults still noticeable, but remediable with cultivation and care, are a strong flavor peculiar to the soil and a disposition on the part of the proprietors to over-alcoholize wines destined for exportation. In many instances also the grapes are gathered indiscriminately, often before they are ripe, whilst the quality is also frequently further damaged by want of attention and cleanliness in treatment. There can be no doubt that with proper treatment the wines of Italy would hold a much higher position than they do at present, the exports being, so far, trifling compared with the amount of production, and consisting to a great extent of Sicilian wines. Of the wines of northern Italy the best known descriptions are perhaps those of Montferrat and Asti. These are mostly light in color, hard, and somewhat difficult to keep. Some of the white wines of this district are very good. A large quantity of sparkling wine is also produced. The general nature of the soil is extremely fertile and the climate moderate, so that everything points to northern Italy as very suitable for wine production. In central Italy the best wines are those of Montepulciano, Chianti, Pomino, Montalcino, and Carmignano. The greater proportion of the wine made here is from the province of Tuscany, which is also a very suitable one for the vine. These wines have considerable alcoholic strength, and are fit for consumption in about six to twelve months after the vintage, attaining perfection in two years. The price usually varies from 11d. [22 cts.] to 2s. 11d. [70 cts.] per gallon, according to growth. The wines of Montepulciano have a brilliant purple color and a luscious flavor, although not cloying to the palate, their sweetness being generally tempered with an agreeable sharpness and astringency. The rocky hills of Chianti near Siena furnish another description of red wine, which is also sweet but less aromatic. An excellent wine of the claret type is produced at Artimino. But perhaps the choicest wines grown in Italy are those of the Neapolitan district. Of these the best known are the Lacryma Christi, a red wine of good bouquet and an elegant taste, several descriptions of good class Muscat wine, and also a description of Malvoisie. These three sorts are the produce of vines grown on the slopes of Mount Vesuvius nearest the sea. Of the Lacryma Christi only a small quantity is made, but many of the second-rate wines of the neighborhood take the name and pass in common for the growth.

Until recently the greater portion of the wines exported by Italy to other countries were for blending purposes. Lately, however, there has been a marked improvement in this respect, and a considerable quantity of wine is now exported in bottle. A trade of some importance is being developed with the United States, the imports in 1887 having amounted to 26,340 dozen bottles and 71,020 gallons in bulk.

Sicilian.

The principal wine produced in Sicily is that grown in the neighborhood of Marsala, from which town it takes its name. The character of the wine is somewhat after the style of Madeira, it having good bouquet and improving with age. It is the result of a mixture of various kinds of grapes carefully selected, amongst which are included the usual Madeira varieties. Thanks to the care bestowed upon its production, Marsala has of late years acquired considerable reputation. The vintage usually takes place about the third week in September, which, although somewhat late for so southern a latitude, allows the grapes to mature thoroughly, whilst all the rotten ones are carefully picked out before the fruit is put into the press. The shippers usually arrange to purchase the vintage from the growers, subject to the condition that the wine is made in a certain manner. The must is collected in large casks capable of holding about 250 gallons each, in which it is allowed to ferment. The system pursued in the preparation of Marsala, as in the case of other strong wines, consists in the addition of a certain quantity of spirit, according as the wine is intended for shipment to England or for consumption in Italy, the former being generally brought up to a strength of 33° to 35°, or about 5° more than that reserved for home consumption, the extra strength being to enable the wine to stand the sea voyage. Taken generally, there is very little difference between the qualities of the different growths of Marsala; in fact, where the system of fortifying and sweetening is properly carried out and the best description of finings used to reduce the reddish tint found in most of the wines, it is almost impossible when the wines are two or three years old to detect any great variation, whilst such a thing as bad Marsala can scarcely be said to exist. Formerly all Marsala wines judged not sufficiently good for consumption as such were made into spirit for fortifying the better description; but, since the Italian Government has raised the duty on alcohol, a different system is adopted. The inferior class of must is not now fermented, but is reduced by evaporation to about two-thirds of its original bulk, thus forming a sort of essence. This essence is added to the wine intended for consumption in the proportion of from 5 to 10 per cent. at the commencement of the fermentation. Within about two months of the first drawing-off of the wine the contents of each cask are carefully examined, and all which may be considered not sufficiently good for Marsala is set aside; and this operation is repeated in March or April. Immediately after the next vintage it is examined for the third time, after which it is fined and drawn off into large vats capable of holding up to 18,000 gallons each. These vats, like the Spanish soleras, are never entirely emptied, a certain quantity of old wine being allowed to remain in them, which gives the new wines the bouquet and character peculiar to true Marsala.

Austria-Hungary.

Hungarian.

Of the Austrian-Hungarian empire Hungary, from a viticultural point of view, forms by far the most important part. The quantity of wine produced in that country has assumed of late years considerable proportions, the white wines being both greater in quantity and of better description than the red. Inclusive of Croatia and Slavonia, it is estimated that there are in Hungary upwards of 1,000,000 acres of vineland, producing annually some 250,000,000 gallons of wine, the value of which is estimated at over £16,000,000 [$77,760,000]. The wines of central Hungary are strong, and include white varieties varying in color from a light to a deep yellow tinge, as well as wines of considerable depth of color. Those of the south of Croatia are as a rule less strong, but are for the most part of a deep color and are generally known as black wines. The produce of Transylvania ranks extremely high, and is for the most part white, although some excellent red wines are grown. The strength of Hungarian wines is moderate, that of Tokay being from about 20 to 25 per cent. of proof spirit, whilst Carlowitz averages from 24 to 25. The other descriptions generally have a less alcoholic strength. Foremost among the wines of Hungary is the sweet Tokay, grown in the submontane district around the town of Tokay, which covers a space of about 20 square miles. Throughout the whole of this district it is the custom to collect the grapes only when they have become dry and sweet, almost like raisins. The fruit is gathered separately and the best wine made from selected grapes. The grapes are first put together in a cask, in the bottom of which holes are bored to let that portion of the juice escape which will run away without pressure. This forms the highest quality. The grapes are then squeezed for the ordinary wine. In abundant years the yield of Tokay reaches nearly 2,000,000 gallons, of which about 15 per cent. are of really superior quality, and of this about one-fifth is classified as extra fine. The three classes of Tokay are known as *essentia*, *ausbruch*, and *máslás*, the first-named being the yield of the juice taken without pressure. It is, however, so scarce that it never appears in the market. The vineyards of Menes (in the county of Arad) produce a sweet red wine. Carlowitz is produced farther south, on the banks of the Danube, some 40 miles northwest of Belgrade. It has somewhat of the character of port wine, although more astringent and lacking in fruitiness. Many of the Hungarian vineyards also produce Muscat-flavored wines which are highly appreciated. The vintage in Hungary lasts from the commencement of October to the end of November, and for the most part is conducted on an imperfect principle, although great improvements have been introduced of late years. The grapes are crushed by the feet in some places, whilst in others a kind of mill is used, and in others again they are pressed in sacks. The wine is usually prepared in wooden utensils, generally made on the spot, the trade of the cooper being but little known. The system of carrying on the fermentation in closed barrels is not always adopted, and the wine is frequently spoilt by not being drawn off in time.

Dalmatian.

Next to Hungary the principal vine-growing district of the empire is Dalmatia, in which the vine culture has of late increased to an enormous extent. Fifty years ago the vine was scarcely grown, except in the islands and on the sea-coast; but it has now penetrated into the interior, and occupies about one-twentieth part of the soil under cultivation. The Dalmatian wines, which are almost entirely red, have generally full color and contain a high degree of alcohol, whilst they also possess a good body and bouquet, resembling in a great measure the wines of Burgundy. The average annual production is 22,000,000 gallons, of which only about 4,000,000 are exported; but this branch of the trade is gradually increasing. Defective cellarage, imperfect fermentation, and general ignorance as to manipulation prevented the development of the wine trade of Dalmatia for many years; but these defects have of late been in a great manner remedied by the action of the Austrian Government in educating the proprietors in this respect. The best wines produced in the province are Moscato Roso, Vino Taitaro, Prosecco Vugova, Maraschino, and Malvasia.

Germany.

Rhine wines.

German wines, generically spoken of as Hock and Moselle, are the products of the most northern latitude of successful vine-culture in Europe. To this circumstance must be attributed the fact that a greater inequality exists in the different vintages than is known in connection with the wines of any other country. In a successful season, when the grapes have been able to mature thoroughly, perhaps no class of wine shows more elegance and quality than do those of the Rhine provinces, while, on the other hand, there are none on which the adverse influence of cold and wet is more apparent. The principal wine-producing districts of Germany are Alsace-Lorraine, Baden, Würtemberg, the Hessian and Bavarian Palatinates, and the Rheingau, the total annual production of which is about 80,000,000 gallons. Of these the first three give half the aggregate yield; but their wines are chiefly light and poor, and are only used for home consumption. The best wines of Germany are grown on the banks of the Rhine in the neighborhood of Mainz: the Rheingau, in which the choicest descriptions are grown, lies on the right bank of the river, whilst the vineyards of Hesse lie on the left. The wines produced on the left bank are full-bodied and with good flavor, the best growths being Liebfraumilch, Nierstein, Scharlachberg, and Forst, which are considered nearly equal to the Rheingau wines. Amongst the latter are the wines of Johannisberg and Steinberg; the first-named is looked upon as the king of German wines. In the same neighborhood are also the celebrated vineyards of Rüdesheim, Gräfenberg, and Rauenthal. The vineyard of Johannisberg is said to have been planted about the year 1009, under the direction of Ruthard, archbishop of Mainz. During the Thirty Years' War these vineyards were destroyed, but in 1722 the abbot of Fulda built a château on the site of the old convent and re-planted the vineyards. Hochheimer is the produce of a comparatively small district situated on the banks of the Main, several miles above its junction with the Rhine. The name (whence Hock) has been known in England for upwards of two hundred years, and no doubt originally included and denoted the general body of Rhine wines.

Moselle wines.

The wines of the Moselle, many of which are shipped as sparkling wines, occupy only a secondary position, although in favorable seasons they are characterized by a light, pleasant flavor with a marked aroma. The wines of Germany, at least of the descriptions exported, are mostly white, although a small quantity of red is grown in the Palatinate, notably at Assmannshausen, which resembles Burgundy. The yield, however, is comparatively trifling. Amongst the leading descriptions of vine plants in German vineyards the Riesling stands out pre-eminent. It is generally planted on the rocky mountain slopes, and the bunches of white grapes which it produces only ripen perfectly in years of high temperature.

When this is the case, however, they yield a wine of high quality, the characteristics of which develop as the wine grows older. On the lower lands the species known as the Kleinberger and Oestreicher are planted, the grapes of which ripen more easily and produce more freely than the Pineau Riesling grape. The French vines, the Pineau and Gros Blanc, are also cultivated in Germany. But one-half of the vines growing on the banks of the Rhine are Riesling plants, which are probably indigenous to the valley, as, although planted elsewhere, they have never been found to yield fruit of such quality as in the Rheingau. Great care is bestowed upon the process of vintage, which usually takes place at as late a date as possible, as a rule not before the end of October or beginning of November, in order to allow the grapes to ripen as thoroughly as may be. The wine is allowed to ferment in casks instead of in vats, as in most other countries, owing to which circumstance considerable difference in quality and price is apt to exist in the produce of the same growth and vintage. After the grapes are gathered, they are pressed as they attain ripeness; and, after the fermentation is duly effected, the wine is fined and racked into vats, which are constantly filled up so that the wine improves with age. The time for racking varies with different proprietors, some taking the wine off the lees in the February following the vintage, whilst others allow the lees to remain a year in the wine, a process which gives it a fuller and sweeter taste. Several years are required to get the wine fit for bottling, as there is no fixed period at which it will finish its fermentation; in fact the finer the wine the longer the time requisite to get it in condition. During this period it receives the greatest attention and is frequently tested, condition being perhaps the greatest difficulty in connection with German wines.

Russia and Greece.

Russia and Greece.

A certain quantity of wine is made in the southern portions of Russia and in Greece; but the quality is mostly coarse and common, and the produce is almost entirely used for home consumption.

United States.

United States.

The cultivation of the vine has made rapid progress of late years in the United States, and American wines are steadily taking the place of the foreign product. The soil and climate of the Pacific coast seem best adapted to the growth of the vine, and wine-making appears likely to become one of the leading industries of California, where the vine was first introduced by the Franciscan fathers about the year 1769. The variety of grape first planted in that region was known as the "Mission" grape, and is generally supposed to have been imported from Mexico. Subsequently the principal varieties of French, German, and Spanish vines were introduced into that State and have all been tried with more or less success. The result is that several descriptions of wine are now made in California resembling, to a certain extent, the leading European types, although, as a rule, of a coarser style,—a defect, however, which is disappearing with the spread of technical knowledge. Although California is by far the largest grape-growing State in the Union, producing nearly one-half of the wines made in the United States, yet the rate of increase of the product during the past five years has been greatest in other States. In Ohio, upon the shores of Lake Erie and along the Ohio river, the vine is extensively cultivated. The champagnes and clarets made in the neighborhood of Sandusky and Cleveland, and the "sparkling Catawba," made originally by Nicholas Longworth of Cincinnati, are produced in considerable quantities. New York, Missouri, Illinois, and Pennsylvania are likewise large wine-producing States, the largest wine-manufacturing establishment being in New York State, in Steuben county. The annual yield in each of these States ranges now (1888) from 2,000,000 to 4,000,000 gallons. Wines of inferior quality are made in small quantities in nearly all the States. In the eastern and middle States the principal grapes are the Catawba and Ives seedling, while in the south the Virginia seedling and the Scuppernong[1] grapes are the favorites. The wine-grapes in these regions resemble the grapes of Germany and France, containing more acid and flavor, while those grown on the Pacific coast are of a milder and sweeter character, resembling the wines of Spain. The principal obstacles in the way of the cultivation of the vine in the United States are mildew and blight, which sometimes destroy the entire foliage of the vine, and the grape-rot, which in some localities has baffled the grower and caused the abandonment of grape-culture. The ravages of the *Phylloxera* are likewise encountered in certain localities, but these are not so extensive in the United States as in France, and, indeed, certain varieties of vine are entirely free from them. The exports of American wines, though still small, are rapidly increasing. The imports of foreign wines have steadily decreased during the past fifteen years. The total annual production of wine in the United States now amounts to about 35,000,000 gallons.

Cape of Good Hope.

Cape of Good Hope.

Previous to the alteration of the wine duties in 1860, which placed foreign and colonial wines on a similar basis, a considerable business was developing in the United Kingdom in favor of Cape wines, especially of those descriptions most resembling the traditional port and sherry. The Cape of Good Hope in its geographical and climatic elements greatly resembles the vine-growing countries of Europe, and, notwithstanding certain earthy characteristics (due in the main to imperfect cultivation) which were inseparable from its wines, bade fair at one time to rival the best of its competitors north of the equator. The equalization of duty, however, has considerably checked the trade in Great Britain, notwithstanding the great improvement which has since taken place in wine-making at the Cape.

Australia.

Australia.

Wine-producing has been prosecuted as an industry for many years in the Australian colonies, and in some instances with considerable energy. But it has not hitherto developed to any great extent, owing to the absence of differential duties to favor the growers and the cost of freight, although from the quality of their production they have no reason to dread competition with the wine-growers of Europe. The Australian colonies (Victoria, South Australia, New South Wales) have suffered much from want of technical knowledge both in vine selection and wine preparation, though in both of these branches considerable progress has been made during the last few years. According to Mr. J. P. Stow, in his *History of South Australia*, the tentative stage of vine culture in that colony has now passed. Good markets for its vintages may be expected in Europe as soon as wines of certain qualities are made in sufficient quantities to allow of heavy stocks being kept. As with the growths of Médoc, attempts are being made to keep the yields of the various vineyards distinct, those of Highercombe, Auldana, Tintara, etc., in South Australia being well known in Great Britain. In their principal characteristics these wines resemble those of France, the red wines being intermediate between claret and Burgundy, while the white wines, although the fuller descriptions come near Sauterne and Chablis, as a rule take more after those of the Rhine. The quantity imported into England during 1887 amounted to 168,188 gallons.

Asia.

Asia.

Although holding a position of little importance in wine-growing, as compared with Europe, Asia yields a certain quantity for home consumption. Chief amongst these are the wines of Caucasia and Armenia, which, according to Thudicum, are more notable for their alcoholic strength than for their color. Wines are also made in Persia, especially in the district of Shiraz; these, however, rarely find their way into the market. (H. J. N.)

WINKELRIED, Arnold von. The incident with which this name is connected is, after the feat of Tell, the best known and most popular in the early history of the Swiss Confederation. We are told how, at a critical moment in the great battle of Sempach, when the Swiss had failed to break the serried ranks of the Austrian knights, a man of Unterwalden, Arnold von Winkelried by name, came to the rescue. Commending his wife and children to the care of his comrades, he rushed towards the Austrians, gathered a number of their spears together against his breast, and fell pierced through and through, having opened a way into the hostile ranks for his fellow-countrymen, though at the price of his own life. But the Tell and Winkelried stories stand in a very different position when looked at in the dry light of history, for, while in the former case imaginary and impossible men (bearing now and then a real historical name) do imaginary and impossible deeds at a very uncertain period, in the latter we have some solid ground to rest on, and Winkelried's act might very well have been performed, though, as yet, the amount of genuine and early evidence in support of it is very far from being sufficient.

---

[1] [The Scuppernong produces an amber wine of musky flavor and strong bouquet. The vine grows only in Eastern North Carolina and the southern counties of Virginia, but the grapes are not in clusters.—Am. Ed.].

The Winkelrieds of Stanz[1] were a knightly family when we first hear of them, though towards the end of the 14th century they seem to have been but simple men without the honors of knighthood, and not always using their prefix "von." Among its members we find an Erni Winkelried acting as a witness to a contract of sale on May 1, 1367, while the same man, or perhaps another member of the family, Erni von Winkelried, is plaintiff in a suit at Stanz on September 29, 1389, and in 1417 is the landamman (or head man) of Unterwalden, being then called Arnold Winkelriet. We have, therefore, a real man named Arnold Winkelried living at Stanz about the time of the battle of Sempach. The question is thus narrowed to the points, Was he present at the battle, and did he then perform the deed commonly attributed to him? involving a minute investigation of the history of that battle, to ascertain if there are any authentic traces of this incident, or any opportunity for it to have taken place.

(1) *Evidence of Chronicles.*—The earliest known mention of the incident is found in a Zurich chronicle (discovered in 1862 by Herr G. von Wyss), which is a copy, made in 1476, of a chronicle written in or at any rate not earlier than 1438, though it is wanting in the 16th-century transcript of another chronicle written in 1466, which up to 1389 closely agrees with the former. It appears in the well-known form, but the hero is stated to be "ein getrüwer man under den Eidgenozen," no name being given, and it seems clear that his death did not take place at that time. No other mention has been found in any of the numerous Swiss or Austrian chronicles till we come to the book *De Helvetiæ Origine*, written in 1538 by Rudolph Gwalther (Zwingli's son-in-law), when the hero is still nameless, being compared to Decius or Codrus, but is said to have been killed by his brave act. Finally, we read the full story in the original draft of Giles Tschudi's chronicle, where the hero is described as "a man of Unterwalden, of the Winkelried family," this being expanded in the final recension of the chronicle (1564) into "a man of Unterwalden, Arnold von Winckelried by name, a brave knight," while he is entered (in the same book, on the authority of the "Anniversary Book" of Stanz, now lost) on the list of those who fell at Sempach at the head of the Nidwald (or Stanz) men as "Herr Arnold von Winckelriet, ritter," this being in the first draft "Arnold Winckelriet."

(2) *Ballads.*—There are several war songs on the battle of Sempach which have come down to us, but in one only is there mention of Winkelried and his deed. This is a long ballad of 67 four-line stanzas, part of which (including the Winkelried section) is found in the additions made between 1531 and 1545 to Etterlin's chronicle by H. Berlinger of Basel, and the whole in Werner Steiner's chronicle (written 1532). It is agreed on all sides that the last stanza, attributing the authorship to Halbsuter of Lucerne, "as he came back from the battle," is a very late addition. Many authorities regard it as made up of three distinct songs (one of which refers to the battle and Winkelried), possibly put together by the younger Halbsuter (citizen of Lucerne in 1435, died between 1470 and 1480), though others contend that the Sempach-Winkelried section bears clear traces of having been composed after the Reformation began, that is, about 1520 or 1530. Some recent discoveries have proved that certain statements in the song usually regarded as anachronisms are quite accurate; but no nearer approach has been made towards fixing its exact date, or that of any of the three bits into which it has been cut up. In this song the story appears in its full-blown shape, the name of Winckelriet being given.

(3) *Lists of Those who Fell at Sempach.*—We find in the "Anniversary Book" of Emmetten in Unterwalden (drawn up in 1560) the name of "der Winkelriedt" at the head of the Nidwald men; and in a book by Horolanus, a pastor at Lucerne (about 1563), that of "Erni Winckelried" occurs some way down the list of Unterwalden men.

(4) *Pictures and Drawings.*—In the MS. of the chronicle of Diebold Schilling of Bern (*c.* 1480) there is in the picture of the battle of Sempach a warrior pierced with spears falling to the ground, which may possibly be meant for Winkelried; while in that of Diebold Schilling of Lucerne (1511), though in the text no allusion is made to any such incident, there is a similar picture of a man who has accomplished Winkelried's feat, but he is dressed in the colors of Lucerne. Then there is an engraving in Stumpf's chronicle (1548), and, finally, the celebrated one by Hans Rudolph Manuel (1551), which follows the chronicle of 1476 rather than the ballad.

The story seems to have been first questioned about 1850 by Moritz von Stürler of Bern, but the public discussion of the subject originated with a lecture by Prof. O. Lorenz on "Leopold III. und die Schweizer Bünde," which he delivered in Vienna on March 21, 1860. This began the lively paper war humorously called "the second war of Sempach," in which the Swiss (with but rare exceptions) maintained the historical character of the feat against various foreigners—Austrians and others.

Most of the arguments against the genuineness of the story have been already more or less directly indicated. (1) There is the total silence of all the old Swiss and Austrian chronicles until 1538, with the solitary exception of the Zurich chronicle of 1476 (and this while they nearly all describe the battle in more or less detail). The tale, as told in the 1476 chronicle, is clearly an interpolation, for it comes immediately after a distinct statement that "God had helped the Confederates, and that with great labor they had defeated the knights and Duke Leopold," while the passage immediately following joins on to the former quite naturally if we strike out the episode of the "true man," who is not even called Winkelried. (2) The date of the ballad is extremely uncertain, but cannot be placed earlier than at least 60 or 70 years after the battle, possibly 130 or 140, so that its claims to be regarded as embodying an oral contemporary tradition are of the slightest. (3) Similar feats have been frequently recorded, but in each case they are supported by authentic evidence which is lacking in this case. Five cases at least are known: a follower of the count of Hapsburg, in a skirmish with the Bernese in 1271; Stülinger of Ratisbon in 1332, in the war of the count of Kyburg against the men of Bern and Solothurn; Conrad Royt of Lucerne, at Nancy in 1477; Herni Wolleben, at Frastenz in 1499, in the course of the Swabian war; and a man at the battle of Kappel in 1531. (4) It is argued that the course of the battle was such that there was little or no chance of such an act being performed, or, if performed, of having turned the day. This argument rests on the careful critical narrative of the fight constructed by Herr Kleissner and Herr Hartmann from the contemporary accounts which have come down to us, in which the pride of the knights, their heavy armor, the heat of the July sun, the panic which befell a sudden part of the Austrian army, added to the valor of the Swiss, fully explain the complete rout. Herr Hartmann, too, points out that, even if the knights (on foot) had been ranged in serried ranks, there must have been sufficient space left between them to allow them to move their arms, and therefore that no man, however gigantic he might have been, could have seized hold of more than half a dozen spears at once.

Herr K. Bürkli (*Der Wahre Winkelried,—die Taktik der alten Urschweizer*, Zurich, 1886) has put forth a theory of the battle which is, he allows, opposed to all modern accounts but entirely agrees, he strongly maintains, with the contemporary authorities. According to this the fight was not a pitched battle but a surprise, the Austrians not having had time to form up into ranks. Assuming this, and rejecting the evidence of the 1476 chronicle as an interpolation and full of mistakes, and that of the song as not proved to have been in existence before 1531, Herr Bürkli comes to the startling conclusion that the phalanx formation of the Austrians, as well as the name and act of Winkelried, have been transferred to Sempach from the fight of Bicocca, near Milan (April 27, 1522), where a real leader of the Swiss mercenaries in the pay of France, Arnold Winkelried, really met his death in very much the way that his namesake perished according to the story. Herr Bürkli confines his criticism to the first struggle, in which alone mention is made of the driving back of the Swiss, pointing out also that the chronicle of 1476 and other later accounts attribute to the Austrians the manner of attack and the long spears which were the special characteristics of *Swiss* warriors, and that if Winkelried were a knight (as is asserted by Tschudi) he would have been clad in a coat of mail, or at least had a breastplate, neither of which could have been pierced by hostile lances.

Whatever may be thought of this daring theory, it seems clear that, while there is some doubt as to whether such an act as Winkelried's was possible at Sempach, taking into account the known details of the battle, there can be none as to the utter lack of any early and trustworthy evidence in support of his having performed that act in that battle. It is quite conceivable that such evidence may later come to light; for the present it is wanting.

---

[1] Their history from 1248 to 1534 has been minutely worked out from the documents by Herr Hermann von Liebenau, in a paper published in 1854, and reprinted at Aarau in 1862, with much other matter, in his book, *Arnold von Winkelried, seine Zeit und seine That.*

Authorities.—See in particular Theodor von Liebenau's *Die Schlacht bei Sempach—Gedenkbuch zur fünften Säcularfeier* (1886), published at the expense of the Government of Lucerne. This contains every mention or description of the battle or of anything relating to it, published or unpublished, in prose or in verse, composed within 300 years after the battle, and is a most marvellous and invaluable collection of original materials, in which all the evidence for Winkelried's deed has been brought together in a handy shape. Besides the works mentioned in the text, the following are the most noteworthy pamphlets relating to this controversy. In support of Winkelried's act: G. v. Wyss, *Ueber eine Zürcher-Chronik aus dem 15ten Jahrhundert*, Zurich, 1862; A. Daguet, "La Question de Winkelried," in *Musée Neuchâtelois* for Dec. 1883; G. H. Ochsenbein, "Die Winkelriedfrage," in *Sonntagsblatt* of the *Bund* newspaper for Jan. and Feb., 1879; A. Bernouilli, *Winkelrieds That bei Sempach*, Basel, 1886; W. Oechsli, *Zur Sempacher Schlachtfeier*, Zurich, 1886; E. Secretan, *Sempach et Winkelried*, Lausanne, 1886; and the summary in K. Dändliker's larger *Geschichte der Schweiz*, i. 510-525, Zurich, 1884. Against Winkelried's claims we have the remarkable study of O. Kleissner, *Die Quellen zur Sempacher Schlacht und die Winkelriedsage*, Göttingen, 1873; O. Hartmann, *Die Schlacht bei Sempach*, Frauenfeld, 1886; and the concise summary of the evidence given by M. v. Stürler (the first to suspect the story) in the *Anzeiger für Schweiz. Geschichte*, 1881, 392-394. (W. A. B. C.)

WINNIPEG, capital of the province of Manitoba, in the dominion of Canada, stands at the confluence of the Red River and the Assiniboine, in 49° 56′ N. lat. and 97° 7′ W. long., and 764 feet above the sea. Its name is taken from Lake Winnipeg (Ojibway, *Win*, "muddy," and *Nipi*, "water"). The waters of the Red River reach the lake 45 miles north of the city. For some five miles north of "the Forks," as the junction of the rivers was formerly called, lay the old Red River colony of Lord Selkirk, founded in 1812 (see vol. xx. p. 328). Five fur traders' or colonists' forts have stood within the city limits: (1) Fort Rouge (1736), of the French voyageurs; (2) Fort Gibraltar (1804–15), built by the northwest traders of Montreal; (3) Fort Douglas (1813–35), Lord Selkirk's fort; (4) old Fort Garry (1821–35), of Hudson's Bay Company; and (5) new Fort Garry (1835–82). The transfer of Rupert's Land to Canada in 1870 led to the formation of the province of Manitoba. Then, too, Winnipeg was begun as a village, half a mile north of Fort Garry. The city is built on a prairie; a part of the site was swampy, but is being well drained. The city includes both sides of the Assiniboine, but on the east side of the Red River there is an independent corporation, the town of St. Boniface, which is virtually a suburb. St. Boniface, with 1449 inhabitants, was first settled by Lord Selkirk's German De Meuron soldiers in 1817. The growth of Winnipeg has been remarkable. Living on its site in 1871 there were but 241 souls. As Canadian immigration increased the village grew, and in 1873 it was incorporated as a city, in the face of strenuous opposition by the Hudson's Bay Company. The census of 1881 gave the city 7985 inhabitants. In the following year Winnipeg, as being the central point of the Canadian Pacific Railway, which connects the Atlantic and Pacific Oceans, became a place of great prospective importance. An enormous rise in values took place. The population of the city doubled in a few months, and the wildest speculation took place. This inflation, locally known as "the boom," caused much damage, and in the following year the collapse brought down almost all the business men of the city. The population diminished very rapidly, but has risen again, and is now increasing. The census of 1886 gave Winnipeg 20,238 inhabitants.[1] The city has water, gas, electric lights, and ample fire protection, and architecturally presents a fine appearance. Main Street, which is 132 feet wide and block-paved for a mile, is stated to be one of the best streets in Canada. Being on the eastern edge of the prairies, which run for a thousand miles to the Rocky mountains, and standing to the west of the great Laurentian formation extending from Montreal, Winnipeg is an important railway centre. The first railway to reach the city was the Pembina branch of the Canadian Pacific Railway, which connects with the railway system of the United States. This took place in December, 1878. The Canadian Pacific Railway has not only its main line now running through the city, but five other branches radiating from this centre. Forty miles of the Hudson's Bay Railway, to run from Winnipeg to York Factory, are already completed, and the Government of Manitoba is constructing (1888) an independent line to connect with the American railway system, to be known as the Red River Valley Railway. The total valuation of property for the city for 1887 was $19,392,410, while the exports of the port of Winnipeg for the year were of the value of $816,260, with $1,929,120 of imports. There are seven chartered banks, and many branches of Canadian and English life assurance and loan associations are in operation. In education Winnipeg is the centre of the Canadian Northwest. The Winnipeg public and secondary schools compare favorably with those of other Canadian cities, and employ 50 teachers, male and female. At Winnipeg is situated the provincial university, to which are affiliated four colleges,—St. Boniface (Roman Catholic), St. John's (Church of England), Manitoba (Presbyterian), and Manitoba medical college. The university has been voted 150,000 acres of wild land by the Dominion Government, and has received $85,000 of a legacy from a native of Rupert's Land. There are 24 church buildings in the city and neighborhood. The census of 1886 gives the religion of the population as follows: Church of England, 5962; Presbyterians, 5271; Methodists, 3217; Roman Catholics, 2244. The societies are the historical and scientific society, and St. Andrew's, St. George's, St. Patrick's, St. Jean Baptiste, Scandinavian, and Hebrew national societies. Masonic, oddfellows', and temperance organizations are strong. There are two hospitals, besides a children's home and maternity hospital. The finer buildings and erections are the city hall, post-office, parliament buildings, governor's residence, court-house, college buildings, Hudson's Bay Company warehouse, Westminster block, Cauchon block, and the volunteer monument of 1886 on the City Square.

WINONA, a city and the county seat of Winona county, Minnesota, United States, is situated upon the west bank of the Mississippi, on a terrace slightly elevated above the river. This terrace is in the bottomland, which is here 5 to 7 miles in width between the bluffs, which rise 400 to 500 feet above it. The surrounding country is fertile and well settled, being devoted principally to the culture of the cereals. There are ample railroad communications, and the Mississippi is navigable for 160 miles above the city. Lumber and flour are manufactured largely. The population in 1885 was 15,664; in 1880 it was 10,208, one-third being foreign-born. The colored element was inconsiderable.

The town was laid out in 1852, and five years later a city government was organized. In 1860 a large part of the city was destroyed by fire; but the losses were speedily repaired, and since that time the growth of Winona has been rapid.

WINSLOW, Edward (1595–1655), was born in Worcestershire, England, October 19, 1595. He became a member of Robinson's church at Leyden, and in 1620 joined the "Mayflower" company of pilgrims with his wife and brother, being one of the party which discovered Plymouth Harbor. His wife died soon after their arrival, and his marriage with Mrs. Susanna White was the first marriage in Plymouth colony. He was chosen a magistrate in 1624, and governor in 1633, 1636, and 1644, when Bradford, the usual governor, "by importunity got off." He made several voyages to England as the colony's agent. Returning to England in 1649, he remained until 1655, when Cromwell sent him on a mission to the West Indies. He died on the voyage, May 8, 1655.

Winslow's portrait is in the gallery of the Pilgrim Society at Plymouth. Winsor (*Narrative and Critical History of the United States*, 277, and autograph at page 268) gives a copy of it as "the only authentic likeness of any of the 'Mayflower' pilgrims." The list of his writings is given in the same volume. See also Allen's *American Biography*, and Belknap's *American Biography*.

---

[1] [*Hazell's Annual* for 1888 estimated them at 30,000. —Am. Ed.]

WINTER, PETER (1754–1825), dramatic composer, was born at Mannheim in 1754 (or, according to other accounts, in 1758). He received some instruction from the abbé Vogler, but so little that he may be almost considered as self-taught. After playing in the "kapelle" of the elector Karl Theodor, at Munich, he became in 1776 director of the court theatre. When Mozart produced his *Idomeneo* at Munich in 1781, Winter, annoyed at his success, conceived a violent hatred towards him; yet his own popularity was both brilliant and lasting, and of more than thirty operas written by him between 1778 and 1820 very few were unsuccessful, though, through lack of dramatic power, none have survived him. His most popular work, *Das unterbrochene Opferfest*, was produced in 1796 at Vienna, where in 1797–98 he composed *Die Pyramiden von Babylon* and *Das Labyrinth*, both written for him by Schickaneder in continuation of the story of Mozart's *Zauberflöte*. While in Vienna Winter gratified his spite against Mozart by propagating scandalous and utterly baseless reports concerning his private life. He returned to Munich in 1798. Five years later he visited London, where he produced *Calypso* in 1803, *Proserpina* in 1804, and *Zaïra* in 1805, with great success. His last opera, *Sänger und Schneider*, was produced in 1820 at Munich, where he died, October 17, 1825. Besides his dramatic works he composed some effective sacred music, including twenty-six masses.

WINTERTHUR, a flourishing industrial town in the Töss valley, canton of Zurich, Switzerland. It is 1450 feet above sea-level, and has a rapidly increasing population (in 1870, 9404; in 1880, 13,595; in 1887, 15,516), all German-speaking and nearly all Protestants. It is the point of junction of eight lines of railway, and is therefore of considerable commercial importance. Its main industries are cambric-weaving, cotton-printing, the manufacture of machinery, and wine-growing, Stadtberg being the best variety of wine grown in the neighborhood of the town. It is a modern well-built town with a fine town-hall and well-arranged school buildings. It was formerly very wealthy and thriving, but has suffered severely from the disastrous financial enterprise of the National Railway of Switzerland which it promoted. In 1878 it had to sell its property in that line, and from 1881 to 1885 it was in great difficulties in the matter of a loan of nine million francs guaranteed in 1874 by the town, together with three others in Aargau, to that ill-fated railway. As the three co-guarantor towns were unable to pay their share, the whole burden fell on Winterthur, which has struggled valiantly to meet its liabilities, and has been helped by large loans from the cantonal and federal Governments.

The Roman settlement of *Vitudurum* (Celtic *dur*, water) was a little northeast of the present town, at the place now known as Ober-Winterthur. It was there that in 919 Burkhard II., duke of Alemannia, defeated Rudolph II., king of Transjurane Burgundy. It was practically refounded in the valley in 1180 by the counts of Kyburg, who granted it great liberty and privileges, making it the seat of their district court for the Thurgau. In 1260 the townsmen, in their zeal for additional power, overthrew the castle of the counts. In 1264 the town passed with the rest of the Kyburg inheritance to the Hapsburgs, who showed very great favor to it, and thus secured its unswerving loyalty. In 1292 the men of Zurich were beaten back in an attempt to take the town. For a short time after the outlawry of Duke Frederick of Austria, it became a free imperial city (1415–42); but after the conquest of the Thurgau by the Swiss confederates (1460–61) Winterthur, which had gallantly stood a nine weeks' siege, was isolated in the midst of non-Austrian territory. Hence it was sold by the duke to the town of Zurich in 1467, its rights and liberties being reserved, and its history since then has been that of the other lands ruled by Zurich. In 1717–26 Zurich tried hard by means of heavy dues to crush the rival silk and cotton industries at Winterthur, which, however, on the whole very successfully maintained its ancient rights and liberties against the encroachments of Zurich.

J. C. Troll, *Gesch. d. Stadt Winterthur*, 1840.

WINTHROP,[1] **JOHN** (1587–1649), was born at Groton, Suffolk, England, January 12, 1587.[2] He graduated at Trinity College, Cambridge, about 1605, and was bred to the law. He became a Puritan, and in 1629 was made governor of the Massachusetts Bay Company. The next year he headed the great emigration to Massachusetts, landing at Salem and settling at Boston. The remainder of his life was closely identified with the history of his colony. He was re-elected governor until 1634, and afterwards in 1637–40, 1641–43, and 1646–49. He died at Boston, March 26, 1649.

The tenderness and gentleness of Winthrop's nature are beyond dispute; even such political opponents as Vane retained their personal friendship for him. These qualities, however, were supplemented by a decided antipathy to democracy in every form, which made him the best of civil leaders for the supporters of the ecclesiastical system of early Massachusetts. A vigorous, perhaps captious, statement of this side of his influence will be found in Brooks Adams's *Emancipation of Massachusetts*. His *Life and Letters* have been edited by his descendant, R. C. Winthrop. His *Journal* has been edited by James Savage, who has given it the more appropriate and exact title of *The History of New England*, 1630–1649. *The Winthrop Papers* are in the *Collections* of the Massachusetts Historical Society. Winthrop's descendants have been numerous, and have included an unusual number of men and women of marked ability; see Whitmore's *Notes on the Winthrop Family*. One of them, Theodore Winthrop (1828–1861), of New Haven, was one of the earliest victims of the civil war.

WINTHROP, JOHN (1606–1676), son of the preceding, was born at Groton, England, February 12, 1606. He graduated at Trinity College, Dublin, studied law at the Inner Temple, London, and then travelled on the Continent, seeing some military and diplomatic service. In 1631 he followed his father to Massachusetts, being made a magistrate in 1633. Returning to England, he obtained a commission as governor of Connecticut under the Say and Sele patent, and sent out the party which put up the fort at Saybrook, at the mouth of the Connecticut river. In 1645 he obtained a title to lands in southeastern Connecticut and founded there the present city of New London. Connecticut made him a magistrate in 1651, and elected him governor annually from 1657 until his death. He was the agent who obtained for the colony the charter of 1662. He died at Boston, April 5, 1676.

All of the father's fine qualities, and more, came out in the son. The father has had a few unfavorable critics; the son has always been looked upon as the flower of American Puritanism. Even the son, however, was only the representative, in obtaining the charter, of a knot of able and determined men, who had clearer notions of the commonwealth life at which they were aiming; and the governor does not seem to have approved all of their somewhat vigorous proceedings in putting it into effect. Physicial science had strong attractions for Winthrop. He was one of the founders of the Royal Society, and was constantly interested in mines and mining in New England. The authorities for his life are those given in the preceding sketch.

WINTON, or WYNTOUN, ANDREW OF. See WYNTOUN.

WIRE. The physical properties requisite to make useful wire are possessed by only a limited number of metals and metallic alloys. The metals must in the first place be ductile; and, further, the wire when drawn out must possess a certain amount of tenacity, the quality on which the utility of wire principally depends. The metals suitable for wire, possessing almost equal ductility, are platinum, silver, iron, copper, and gold;

---

[1] [Further particulars of the Winthrop family may be found in the Appendix.—AM. ED.]

[2] [This Old Style date corresponds to 22d January, 1588.—AM. ED.]

and it is only from these and certain of their alloys with other metals, principally brass and bronze, that wire is prepared. By careful treatment wire of excessive tenuity can be produced. Dr. Wollaston first succeeded in drawing a platinum wire $\frac{1}{30000}$ inch in diameter by encasing a fine platinum wire within silver to ten times its diameter. The cord wire he then reduced to $\frac{1}{3000}$ inch, and by dissolving away the silver coating the platinum wire $\frac{1}{30000}$ inch thick only remained. By continued treatment in this way wires of platinum used for spider-lines of telescopes are now obtained of such extreme tenuity that a mile length of the wire weighs not more than a grain; and it is said that platinum wire has been made which measures not more than $\frac{1}{2000}$ mm., equal to less than the fifty-thousandth part of an inch. The accompanying table shows the comparative tenacity of the wire of metals and metallic alloys.

	Diameter.	Strain.
Gold	.0162 inch.	5.61— 5.42 ℔
Platinum	.0161 "	6.70— 6.59 "
Silver	.0157 "	7.86— 7.78 "
Copper	.0177 "	10.11—10.20 "
Iron	.0169 "	11.12—10.89 "
Copper	.0605 "	233 ℔
Brass	.0640 "	203 "
Steel	.0600 "	342 "
Phosphor Bronze	.0630 "	394 "

Wire was originally made by beating the metal out into plates, which were then cut into continuous strips, and afterwards rounded by beating. The art of wire-drawing does not appear to have been known till the 14th century, and it was not introduced into England before the second half of the 17th century. Wire is usually drawn of cylindrical form; but it may be made of any desired section by varying the outline of the holes in the draw-plate through which it is passed in the process of manufacture. The draw-plate is a disk of hard steel pierced with a series of holes corresponding in aperture with the size and section of the wire to be made. The holes are funnel-shaped, being widest at the side where the metal enters, and tapering to their small diameter at the face where the wire is drawn away. The excessive friction, which is partly relieved by lubricants, causes a rapid enlargement of the holes; and where great uniformity of size is required, as in the case of fine gold, silver, and platinum wire, perforated rubies or similar hard stones are fitted in the draw-plate. The draw-plate is mounted in the draw-bench, which is provided with a reel on which the wire is wound, and in drawing down to smaller dimensions it passes through successive smaller holes in the draw-plate—one at a time—and is wound on another reel or frame on the bench. During the drawing the wire requires to be annealed more or less frequently according to the nature of the metal under treatment. The ductility of the metal and the diameter of the wire operated on determine the rapidity with which the wire can be drawn: iron and brass travel at rates varying from 12 to 45 inches per second, while gold and silver wires of fine section may be drawn through at 60 to 70 inches per second. Stout iron wire down to a section of ¼ inch or thereby is made by rolling bars of fine fibrous metal in a rolling mill, in the same way as nail rods, small bars, and angles are rolled. The thinner wires are drawn from these stout wires by the ordinary process of drawing. Iron requires repeated annealing in the process of attenuation, and to preserve it from oxidation it is treated with a scour-bath, consisting of dilute sulphuric acid and a proportion of sulphate of copper. The minute film of copper thus deposited on the wire not only prevents oxidation, but also favors the drawing by lessening the friction in passing through the draw-plate. Much of the iron wire which is to be used in exposed situations is further protected from oxidation by a covering of zinc in the so-called galvanizing process.

In commerce the sizes of wire are estimated by certain more or less recognized standard wire gauges. The most commonly quoted is the Birmingham wire gauge. It gives forty measurements, which bear no definite relation to each other, ranging from the largest No. 0000 = .454 inch to No. 36 = .004 inch. Sir Joseph Whitworth in 1857 proposed a standard wire gauge which is coming to be generally recognized. His measurements range from half an inch to one-thousandth of an inch by regular gradations of one-thousandth. Beginning at the smallest, No. 1 is .001 inch, 2 = .002 inch, 10 = .010 inch, and so on, larger breaks being made in the scale as the size increases, but the number and ratio continuing the same till it ends at No. 500 = .500 inch. In America a standard wire gauge, proposed in 1864 by Messrs. Brown and Sharpe, of Providence, R. I., is now extensively recognized. In it the gradations are uniform, increasing in geometric ratio, so that the size of each successive number is found by multiplying the preceding by 1.123. The standard is calculated from wire No. 36, which in the American gauge represents a diameter of .005, while in the Birmingham gauge No. 36 is equal to .004 inch.

It must be obvious that the uses of wire are multifarious and diverse beyond all enumeration. It forms the raw material of important manufactures, such as the wire-net industry, wire-cloth making, and wire rope spinning, in which it occupies a place analogous to a textile fibre. Wire-cloth of all degrees of strength and fineness of mesh is used for sifting and screening machinery, for draining paper pulp, for window screens, and for many other purposes. Vast quantities of copper and iron wire are employed for telegraph and telephone wires and cables, and as conductors in electric lighting. It is in no less demand for fencing, and much is consumed in the construction of suspension bridges, and cages, etc. In the manufacture of stringed musical instruments and philosophical apparatus wire is again largely used. Among its other sources of consumption it is sufficient to mention pin and hair-pin making, the needle and fish-hook industries, nail, peg, and rivet making, and carding machinery; but indeed there are few industries into which wire does not more or less enter.

WIRE ROPE. See Rope, vol. xx. pp. 868–9.

WISBECH, or Wisbeach, a municipal borough, market-town, and seaport of Cambridge, England, in the Isle of Ely, is situated on the river Nene, on the Wisbech Canal, by which there is connection by the Ouse with Hertford, and on branches of the Great Eastern and Midland Railways, 40 miles north of Cambridge, 21 east-northeast of Peterborough, and about 90 from London. It possesses a spacious market-place, a handsome crescent, and several good streets. There is a public park, 18 acres in extent. The greater part of the town is situated on the south side the river, which is crossed by an iron bridge. The church of St. Peter and St. Paul is very singularly constructed, having two parallel naves, two aisles, and two chancels, with a large square tower at the west end, originally dating from the 12th century, but almost entirely reconstructed about the close of the 15th century. The church contains some semicircular Saxon arches as well as some traces of Early Norman. Among the other public buildings are the corn exchange (re-erected 1811), the public hall, the custom house, the new cattle market, the workingmen's club and institute, and the museum and literary institute, with a library of 12,000 volumes and a fine collection of Roman remains and other antiquities. Besides the Cambridgeshire Hospital (1873) and the twelve corporation almshouses there are a large number of other charities. A grammar-school was established in the middle of the 16th century, and provision was made in the charter of Edward VI. for its continuance. A Gothic monument was erected here to Thomas Clarkson, the anti-slavery orator, in 1881. Vessels of 500 tons burden can enter the port, and extensive wharfage has been erected at a cost of £60,000 [$291,600]. The number of vessels that entered the port in 1886 was 294, of 50,721 tons, and the number that cleared 286, of 50,812 tons. The chief imports are corn, potatoes, wool, timber, and iron, and the exports agricultural produce and salt. In the neighborhood immense quantities of fruit are grown, including apples, pears, plums, gooseberries, and strawberries. Potatoes, asparagus, and other vegetables are also largely grown for the London market. The town possesses agricultural implement works, coach-building works, breweries, ropeworks, planing and sawing mills, and corn and oil-cake mills, many of them driven by water, and others by steam. The town is divided into two wards, and is governed by a mayor, six aldermen, and eighteen councillors. It has a separate commission

of the peace. The corporation act as the urban sanitary authority. Water is obtained from chalk springs near Norfolk. The population of the municipal borough in 1871 was 9362, and in 1881 it was 9249.

Wisbech was most probably a fort of the Romans, who it is supposed constructed the river banks in the neighborhood. It takes its name from the river Ouse (Wyse). It is first noticed in 664, in a charter of Wulfhere, son of Penda. In the early part of the 11th century it was given by Oswy and Leoflede to the convent of Ely, on the admission of their son Alwyn into that monastery. After the subjugation of the Isle of Ely William erected a strong castle at Wisbech to hold the district in subjection. At Domesday the manor was held by the abbot of Ely, and possessed extensive fisheries, especially of eels. In 1190 Richard I. granted to the tenants of the manor exemption from tolls at all fairs and markets in England, a privilege confirmed by King John, who in 1216 visited the town. In 1236 the town and a great part of the castle was destroyed by an inundation, and the castle lay in ruins till the 15th century, when Morton, bishop of Ely, erected a new building of brick for an episcopal residence. In the reign of Elizabeth it was appropriated to the confinement of state prisoners, among others of Robert Catesby. During the Protectorate it was purchased by Thurloe, afterwards secretary of state, who in 1660 erected an entirely new one from designs of Inigo Jones, when some Roman bricks were discovered. On the Restoration it again came into the possession of the bishops of Ely, who sold it in 1793, and all remains of it have now disappeared. Anciently the town possessed eight guilds in addition to that of the Holy Trinity, to which they were subordinate. This guild received royal sanction from Richard II. in 1393, and held its last meeting in 1557. The town received a charter of incorporation from Edward VI. in 1549, which was renewed by James I. in 1611, and confirmed by Charles II. in 1669, remaining in force till the passing of the Municipal Act.

See Watson's *Historical Account of Wisbech*, 1827; *History of Wisbech*, 1833; and "Wisbech Castle," in *Journal of Brit. Arch. Assoc.*, 1879.

WISBY, a picturesque old town on the west coast of the Swedish island of Gotland. It has a considerable trade, but does not occupy half the space enclosed within its old walls, which, with their towers, still survive. These walls, which were built partly on the site of older structures, date from the thirteenth century. The vacant spaces of the town are used as gardens, in some of which are fine ruined churches. The church of St. Mary (built 1190–1225) is used as the cathedral. Of the ten ruined churches the most interesting is that of St. Nicholas, partly in the Romanesque partly in the Gothic style. In 1880 the population of the town was 6924.

In the Middle Ages Wisby was a port of the Hanseatic League, and a great centre of trade. Its wealth was so celebrated that in an old ballad the people were said to play with the choicest jewels, and the women to spin with golden distaffs. All the principal nations of Europe had representatives at Wisby, and some of its beautiful churches were built by foreign residents. In 1361 it was attacked and plundered by King Waldemar III. (Atterdag) of Denmark. It never recovered from this blow, and when, in 1645, Gotland was finally united to Sweden by the treaty of Brömsebro Wisby had altogether lost its importance.

Plate XV.

WISCONSIN, one of the Northeastern Central States of the American Union, has the parallel of 42° 30′ N. lat. for its southern limit, Lake Michigan for its border on the E., Lake Superior on the N., and the Mississippi on the W. Michigan on the E., Minnesota and Iowa on the W., and Illinois on the S. are its neighboring States. Its area, exclusive of water surface, is estimated at 54,450 square miles. Its length from north to south is 300 miles, its breadth 250 miles; its lake shore lines exceed 500 miles. Its surface contours are gentle and pleasing. The lower parts of the State lie about 600 feet above the sea, the highest summits about 1800 feet. Few peaks rise more than 400 feet above their bases, and abrupt elevations of more than 200 or 300 feet are not common except along the Mississippi. The State is merely a swell of land between three notable depressions,—the basins of Lake Michigan, Lake Superior, and the Mississippi. The summit of the swell lies within 30 miles of Lake Superior, whence there is a rapid descent northward, with gentler declines to the southeast and southwest, separated by a low swell extending from the summit southward into Illinois. This is traversed in the south-central portion of the State by a remarkable diagonal valley, occupied by Green Bay and the Fox and Wisconsin rivers, cutting it down to within about 200 feet of the lake levels. The easterly slope is traversed longitudinally by a ridge of Niagara limestone, running nearly parallel to the shore of Lake Michigan, at an average distance of about 30 miles.

The greatest topographical interest—and it is very considerable—lies in the minor surface features. The ice of the Glacial period invaded in force the eastern and northern parts of the State, while an area of 10,000 square miles in the southwestern portion was left untouched. Flowing but very irregular contours, accented by morainic peaks and ridges, by gravel knolls, and by domes of drift, mark the former area; while deep dendritic valleys, erosion cliffs, and castellated outliers give more striking relief to the latter. About 2000 minor lakes dot the eastern and northern portions, all lying within the glaciated area, and caused by the irregular heaping of the drift, or by the erosion of the glaciers. Numerous waterfalls occur in this portion, likewise due to the disturbance of the river-courses by the ice incursion. None occur in the unglaciated area.

Geology.—The geological structure of the State is unusually symmetrical. It has for its nucleus a great mass of the most ancient crystalline rocks (Archæan). This nucleus occupies the north-central portion of the State, and about it are wrapped successive layers of later-formed rocks, lying concentrically upon each other, and occupying all the rest of the State. The ancient nucleus consists of granites, gneisses, syenites, and various highly crystalline schists. These are warped, contorted, and twisted among themselves in the most intricate fashion, and, since their original upheaval, have been extensively cut away, exhibiting what was formerly the interior of a much distorted mass. Whether this was originally sedimentary or igneous is undetermined, so great are the vicissitudes it has suffered since its original formation. It is extensively traversed by dikes and veins. As yet it has not proved to be productive in minerals of notable commercial value, but affords a wealth of the finest of building material. This formation is confidently referred to the Laurentian age, and ranks among the earliest known formations. Around the borders of this nucleus, though not skirting it continuously at the surface, are tracts of Huronian rocks. For the greater part these lie in highly inclined beds, and exhibit evidence of much disturbance since their original formation. Where they come in contact with the Laurentian nucleus, they show, by their unconformity to it, and the erosion of the strata at the contact, that a vast but unknown interval of

General Geological Map of Wisconsin.

time separated the two formations. The Huronian rocks are chiefly quartzites, with which are associated quartz-porphyries and various slates and schists, together with layers of igneous rock, either formed at the same time with other members of the series, or subsequently intruded. They embrace also, especially in the northeastern and northern portions of the State, and extending into the upper peninsula of Michigan, valuable beds of iron ore, as well as beds of carbonaceous material. The amount of carbon contained is large, but unfortunately impure and in the graphitic condition. Limestone also occurs, among the most ancient of its kind. The quartzites of Barron county embrace deposits of pipestone, which also occurs in the Baraboo quartzite, but less notably. Several isolated knobs of quartz-porphyry in central Wisconsin are referred to this formation, and are being extensively utilized for building material, paving, and macadamizing. Apart from the igneous beds, the members of this series were originally sediments, and even now show clearly their fragmental origin. The thickness of the Huronian beds reaches at least 13,000 feet. Overlying the Huronian rocks in the northwestern part of the State is an immense series of igneous beds, sandwiched between which, and also overlying which, are layers of sandstone, shale, and conglomerate, the whole constituting the great copper-bearing (Keweenaw') formation of Lake Superior. This crosses the entire northwestern corner of the State. The strata are bowed downwards, forming a great trough, the axis of which stretches from near the mouth of the Montreal river to the St. Croix. The igneous beds were formed by great outwellings of molten matter, which spread widely over the surface, following each other at longer or shorter intervals, as shown by the presence or absence of intervening deposits or by erosion. The copper of the formation appears to have been brought up by these igneous ejections, and to have been subsequently concentrated by percolating water in the vesicular portions of the old lavas, or in the intervening sandstones or conglomerates, or in fissures traversing the beds,—all these forms being present. The formation in Wisconsin has not yet proved sufficiently rich to pay the expense of mining. The thickness of this formation is truly stupendous, estimates ranging from 25,000 to 45,000 feet.

The preceding formations are found tilted at various angles; those which follow lie nearly flat. The Potsdam sandstone, next in order, rests upon all of these points, coming in contact with different ones in different places. The wear which they had suffered before it was placed upon them indicates a long interval of time. The thickness of the Potsdam is very irregular, owing, to the uneven worn surface of these underlying formations. In places it is upwards of 1000 feet deep. Being an open-textured water-bearing formation, dipping southeastward and southwestward from the central axis of the State, and embracing and being overlaid by impervious beds, it furnishes many fine-flowing wells to the districts bordering Lake Michigan and the Mississippi. Some of its beds supply excellent building material, though in general it is not sufficiently firm. The Potsdam sandstone forms a broad irregular crescentic belt, sweeping around the southern border of the Archæan nucleus. It also skirts the northern side of the Lake Superior basin. Overlying the Potsdam sandstone is a stratum of impure Magnesian Limestone, ranging from 50 to 250 feet in thickness. It forms the surface rock in an irregular ragged belt, stretching from the St. Croix southward along the Mississippi, and southeasterly to the south-central part of the State, and thence northeasterly to the upper peninsula of Michigan. Small quantities of the ores of lead, iron and copper are found in it, and certain portions furnish an excellent building stone. Overlying this, the Lower Magnesian Limestone, is an irregular stratum of nearly pure sandstone (St. Peter's), ranging from a few feet to upwards of 200 feet in thickness. It is composed of nearly pure grains of quartz, and from the absence of cementing material generally crumbles with ease, though in exceptional places it is sufficiently hard to be used as a building stone. Being porous and gently dipping between impervious beds, it supplies some of the finest artesian fountains in the State. Its purer portions afford sand.

Upon the St. Peter's sandstone rests a series of limestone beds, the lower part of which is known as Trenton, the upper as Galena. Their united thickness varies considerably, averaging about 250 feet. In the southwestern part of the State they have yielded large quantities of lead and zinc ores, and some copper. The formation occupies a small area in the northwest of the State, a large area in the southwest, and a belt stretching from south to north through the valleys of Rock river and Green Bay.

Overlying the above limestones is a stratum of about 200 feet in thickness, composed of clay, earthy, and calcareous shales (Hudson River). This is a soft formation and easily eroded, and hence occupies little area at the surface. It forms a narrow north-and-south belt on the eastern margin of the Green Bay and Rock river valley. It has little economic value. At a few points on the surface of these shales there are accumulations of a peculiar Oolitic iron ore (Clinton), popularly known as "seed" or "shot ore" from its concretionary structure. Its highest development is at Iron Ridge in Dodge county, where its thickness ranges from 15 to 25 feet. It is a soft ore, lying in regular horizontal beds, is quarried with great ease, and yields about 45 per cent. of metallic iron.

The next formation is a thick limestone stratum (Niagara), ranging from 400 to 800 feet. The different portions vary greatly in texture and purity, some being very fine-grained, others of admirable granular texture, and others uneven, cavernous, or full of chert nodules. It furnishes excellent building rock, and quicklime of high quality. The formation occupies a broad tract adjacent to Lake Michigan, reaching from the southern line of the State to the head of the Green Bay peninsula. It also caps the elevated mounds in the southwest of the State. The Lower Helderberg limestone, which attains great thickness farther east, is barely (indeed, somewhat doubtfully) represented in the State by some thin shaly beds of limestone found north of Milwaukee. The remainder of the normal Silurian beds and the Lower Devonian formations are not represented in the State, but just north of Milwaukee is a small area of limestone which represents the Hamilton period (Middle Devonian), a portion of which possesses hydraulic properties of a high degree of excellence, and is the basis of an important industry.

From the middle of the Devonian age until the ice incursion of the Glacial period, Wisconsin appears to have been a land surface, subjected to erosion, which developed the hills and valleys that diversify its surface, except as they were modified by the invading ice. As previously indicated, the ice of the Glacial period overrode the northern and eastern portions of the State, while it left about one-fifth of the State in the southwest untouched. The paths of the invading ice were determined by the great valleys of Lake Superior, Lake Michigan, and Green Bay, aided by the diverting influence of the intervening heights. There appear to have been two important invasions,—the earlier covering the larger area, while the later exhibited the more forceful action. There were also minor episodes of glacial advance and retreat. Both spread out an irregular sheet of mixed rock débris, partly derived from the old decomposed surface, and partly produced by the grinding action of the glaciers themselves. The underlying rock was smoothed, scratched, and polished, and in some moderate measure filed down by the overriding ice. A remarkable chain of hills formed about the edge of the ice (the Kettle moraine) constitutes an interesting feature topographically and geologically. It forms a part of an extensive series of terminal moraines that stretch from the Atlantic to the Saskatchewan.

Soils.—The soils of the State are varied. Those of the drift-bearing region are derived from the heterogeneous mixture of pre-glacial soils and glacial grindings, and constitute for the greater part loamy clays and sandy loams of a high degree of fertility and permanence. In the southwest a considerable portion of the soils are derived from the decomposition of the underlying limestone, and are highly fertile and easily tilled. In the central portion there is a considerable area underlaid by the Potsdam sandstone, from which sandy soils, of relatively low fertility, have been derived.

Vegetation.—The greater part of the State was originally covered by forest, but in the south and west considerable areas of prairies were found interspersed with woodlands. The prevalent trees of this region are the oaks, poplars, hickories, and their usual associates. Along the eastern border of the State, except at the very south, is an extensive tract of heavy timber, in which maple, elm, ash, and their usual associates predominate. Towards the north the pines, hemlocks, and spruces come in. The north part of the State was originally covered by an almost unbroken forest, composed of groves of pine, of hard wood, and of a promiscuous mixture of species embracing both conifers and deciduous trees. This constitutes the great lumber region of Wisconsin.

Climate.—Lying between 42½° and 47° N. lat., and near the centre of the continent, Wisconsin has a typical temperate continental climate. Its summers are warm, and diversified by short rains and clear skies; its winters are somewhat severe but relatively dry and stimulating, and are less chilly than more humid atmospheres at similar or even higher temperatures. The average rainfall is about 30 inches. The mean summer temperature varies from about

70° in the south to about 60° in the north; the mean winter temperature varies from about 25° in the south to about 15° in the extreme north. The great lakes produce a marked effect on the seasonal temperature of the State, elevating it in winter and depressing it in summer, so that the summer isotherms run from the northwest to southeast, forced south by the cooling influence of the lakes; while those of the winter run from southwest to northeast, forced north by their warming influence. As a result, productions requiring a high summer temperature flourish in the southwestern and central portions of the State, but are precarious in the vicinity of the lakes, while fruits and crops requiring milder winters and more equable temperatures can be produced near the lakes, but are uncertain away from them. (T. C. C.)

Population.—In 1840 Wisconsin Territory had a population of 30,945. The accompanying table exhibits the population from 1850 to 1880. The State census of 1885 gives the number as 1,563,423. The Federal census of 1880 showed 1,309,618 whites, 2702 colored, and 3161 Indians. The foreign-born population numbered 405,425, or 30.81 per cent. of the whole, of whom 184,328 came from the German empire, 66,284 from the Scandinavian countries, and 78,057 from Great Britain and Ireland.

	Population.			Density per Square Mile.
	Total.	Males.	Females.	
1850	305,391	164,716	140,675	5.61
1860	775,881	407,449	368,432	14.25
1870	1,054,670	544,886	509,784	19.37
1880	1,315,497	680,069	635,428	24.16

Cities.—In 1885 Milwaukee had a population of 158,509; Oshkosh, 22,064; La Crosse, 21,740; Eau Claire, 21,668; Racine, 19,636; Fond du Lac, 12,726; Madison (the State capital), 12,064; Sheboygan, 11,727; Appleton, 10,927; and Janesville, 9941.

Agriculture.—By the United States census of 1880 Wisconsin had 134,322 farms, embracing 15,353,118 acres, of which 9,162,528 acres were improved land. Of these farms 122,163 were cultivated by the owners and 12,159 were rented. The State census of 1885 estimates the total number of persons engaged in agriculture at 332,500, and the value of farms and agricultural products at $568,187,288. The produce is estimated approximately as follows: wheat, 21,000,000 bushels; Indian corn, 37,700,000; oats, 43,000,000; barley, 11,500,000; rye, 2,100,000; potatoes, 11,700,000; hay, 2,300,000 tons; sorghum, 599,000 gallons; apples, 1,671,000 bushels; berries, 71,000 bushels, 29,500 acres of tobacco produced nearly 29,595,000 ℔ (this is in demand for cigar wrappers). Of cheese nearly 33,480,000 ℔ were produced, and of butter 36,240,000 ℔. There were in 1886 about 389,000 horses, 1,256,000 cattle, 6700 mules and asses, 917,000 sheep and lambs, and 777,000 swine.

Manufactures, etc.—Large water-powers are found, chiefly on the Fox, Wisconsin, and Chippewa rivers. In 1885 the value of real estate and machinery used in manufacturing was over $38,000,000; stock and fixtures over $24,000,000; value of manufacturing establishments and their products, $193,700,000. There were about 58,500 men employed. The lumber, shingles, and lath manufactured amounted to $27,113,000; milling (including all flour manufactured from cereals), $19,870,000; wooden articles, $13,719,000; iron products and manufactured articles of iron, $10,300,000; beer, more than 1,445,000 barrels, valued at $9,081,000 (over 75 per cent. of this coming from the great brewing city of Milwaukee); manufactured articles of leather, $8,629,000; wagons, carriages, and sleighs, $4,678,000; paper, $2,804,000; woollen fabrics, $613,000; cotton fabrics, $556,000. The census of 1880 valued the slaughtering and meat-packing product at about $6,534,000 and agricultural implements at $3,742,000.

Lumbering.—The proximity of Wisconsin to the prairie States renders its lumbering interests especially important. In 1886 the total forest area of the State was 17,000,000 acres, or 48.8 per cent. of the whole area. According to the census of 1880, Wisconsin was exceeded only by Michigan and Pennsylvania in the value of its lumber product. Operations are chiefly carried on along the Menomonee, Peshtigo, Oconto, Wolf, Wisconsin, Yellow, Black, Chippewa, Red Cedar, and St. Croix rivers; but the rapid increase in railroads has opened the northern forests very generally. The lumber, shingles, and lath manufactured amounted to about 3,323,390,000 feet in 1885.

Mines and Quarries.—In 1880 Wisconsin ranked sixth among the iron-producing States, but since then its importance has increased. The most extensive iron deposits occur in the Huronian formation in the Menominee region, and along the Montreal river. In 1882 the total product of the Menominee region was 276,017 tons; the Montreal range, divided between Wisconsin and Michigan, about a dozen miles south of Lake Superior, has just been opened up, and there is a rich deposit of Bessemer ore. In 1886 the product of the whole range was about 800,000 tons. The lead and zinc region lies in the southwest of the State; production had been declining, but recently new discoveries have revived it. There is a rich supply of building-stone; limestone quarries are most numerous, but the red-brown sandstone of Bayfield county and the granite of Marquette county are especially valued.

Fisheries.—The white fish and lake-trout fishing industries of Lake Michigan and Lake Superior are extensive, and the inland lakes[1] and streams abound in bass, pike, pickerel, sturgeon, and brook trout. A State fisheries commission annually stocks the waters with brook-trout, white fish, and pike.

Railways and Canals.—There were in Wisconsin in June, 1886, 4576 miles of railway. The leading lines are the Chicago, Milwaukee, and St. Paul; the Chicago and Northwestern; the Chicago, Minneapolis, St. Paul and Omaha; the Milwaukee, Lake Shore, and Western; and the Wisconsin Central. A canal connects the Fox and Wisconsin rivers at Portage, and the Sturgeon Bay Canal unites Green Bay and Lake Michigan.

Administration, etc.—The State, which is divided into sixty-eight counties, is represented in the Congress of the United States by two senators and nine representatives. The supreme court is composed of a chief justice and four associate justices; there are fourteen judicial circuits, each with a judge; and besides these are county and municipal judges and justices of the peace. The State legislature, composed of the senate (33 members) and the assembly (100 members), meets bienially.

Finances.—The value of all taxable property of the State for the year 1886, as determined by the State board of assessment, was as follows: personal property, $114,922,900; city and village lots, $110,564,625; lands, $271,019,627; total assessed value of all property, $496,507,152. Taxes were as follows: State tax, $241,137; county taxes, $2,590,375; town, city, and village taxes, $7,835,385. The total indebtedness of the towns, cities, villages, and school districts in 1885 was $6,848,123; total indebtedness of counties, $1,569,444; bonded debt of the State, $2,252,000.

Charitable, Reformatory, and Penal Institutions.—The State supports two hospitals for the insane, containing together 1141 inmates in 1885, while there are 1240 insane in county asylums, jails, and poorhouses. The school for the deaf has an attendance of 205, school for the blind, 62; industrial school for boys, 292; industrial school for girls, 268; State prison school, 443; a school for dependent children has just been established. The whole number of prisoners in all places of confinement during 1885 was 19,829, and in reformatories 771. The State board of control and the board of charities and reforms have charge of these institutions.

Education.—The State makes liberal provision for its public schools; it sets apart as a permanent fund the Federal grant of section 16 in each township, with 500,000 acres of land, and 5 per cent. of the proceeds of the sale of public lands in the State, together with less important items. In 1886 there were still 103,130 acres unsold, and the amount of the fund at interest was nearly $3,000,000. This school-fund income, which in 1887 was $341,289, is supplemented by a State tax of one mill on the dollar, which amounted to $896,138; the combined amount is annually apportioned among the counties, towns, villages, and cities in proportion to the number of children in each of from four to twenty years of age; in their turn the counties must levy upon each town, city, and village a tax equal to their proportion of the combined school fund and State mill tax. The total receipts from all sources for school purposes in 1886 was $4,192,962, and the disbursements $3,184,958. In the same year there were 556,093 persons of school age. Of those 59.4 per cent. were enrolled in the public schools. The enrolments in normal schools and university (2481), in colleges, seminaries, and academies (1131), and in private schools (14,164) made the total enrolment over 350,000. In 1879 attendance at a public or private school for at least twelve weeks each year was made compulsory on all children between the ages of seven and fifteen years. Women are eligible to all school offices, except that of State superintendent of public instruction. In 1888 there are 137 free high schools, receiving special aid from the State. Provision is made for the education of teachers by the five normal schools. The leading denominational colleges are Beloit, Ripon, Milton, Racine, and Lawrence university. The public school system is crowned by the State university at Madison, organized in 1848. It derives its support chiefly from an annual State tax of one-eighth of a mill on the dollar. The total regular income of the university in 1886 was $105,000; the attendance in 1887 was 600. Connected with the university are a teachers' institute lectureship, and farmers' institutes held in different portions of the State, as well as over sixty accredited high schools.

---

[1] There are about 3000 square miles of clear-water lakes.

The State historical society at Madison, the capital, has a reference library of 125,000 volumes and pamphlets, and is the richest in the nation upon the history of the Mississippi basin; the State law library there has 19,000 volumes, the university library 14,500, and the city library 9000. Milwaukee has a public library of 35,000 volumes.

Antiquities and History.—The State is noted for its exceptionally large number of animal mounds, the work of the "mound-builders." They are found along rivers and lake banks, and are from 2 to 6 feet high, sometimes 200 feet long; remains of prehistoric circumvallations, with brick baked *in situ*, have been found, and the largest collection of prehistoric copper implements has been made in this State. Wisconsin was the meeting ground of the Algonkin and Dakota Indian tribes. Its water system connecting the Great Lakes and the Mississippi made it the keystone of the French possessions in Canada and Louisiana. The genesis of Wisconsin was from the fur trade. French explorers, ascending the Ottawa, crossed to Lake Huron, whence they easily passed through the Straits of Mackinaw to Green Bay, thence up the Fox to the portage between it and the Wisconsin, and on to the Mississippi. In 1634 an agent of Champlain, Jean Nicolet, first of recorded white men to reach Wisconsin soil, ascended the Fox a considerable distance. In 1658–59 Radisson and Groseilliers, two fur traders who afterwards induced England to enter the Hudson Bay region, passing along the south shore of Lake Superior, struck southward to the tributaries of the Mississippi. Radisson's journal describes a great river visited by him, which was probably the Mississippi. In 1665 Father Claude Allouez founded a Jesuit mission at La Pointe, and in 1669 the mission of St. Francis Xavier on the shores of Green Bay. Louis Joliet, leaving Quebec under orders to discover the South Sea, in 1673, took with him Father Marquette from Mackinaw, and reached the Mississippi by the diagonal water-way of the Fox and Wisconsin rivers. In 1679 La Salle, accompanied by Father Hennepin, passed along the western shore of Lake Michigan to the Illinois, and in the next year Hennepin, ascending the Mississippi, met Du Luth, who had reached it by way of the western extremity of Lake Superior. Thus were traced out the bounds and principal river-courses of Wisconsin. The epoch of the fur trade followed, during which stockade posts were erected at various key-points on the trading routes; they became dependencies of Mackinaw, long the emporium of the fur trade. In the French and Indian war of 1755–60 Wisconsin savages served under Charles de Langlade against the English at Braddock's defeat and elsewhere. Near the middle of the 18th century De Langlade and his father had established a trading post at Green Bay, which afterwards became a fixed settlement; at the close of the revolutionary war Prairie du Chien, at the mouth of the Wisconsin, grew into a like settlement; and toward the close of the century Milwaukee, La Pointe, and Portage became permanent trading posts. The British garrison that was sent in 1761 to hold Green Bay left at the outbreak of Pontiac's war, and did not return. In the revolutionary war Wisconsin Indians under De Langlade supported the British. England having retained Mackinaw despite the treaty of 1783, American domination was not practically felt by the Wisconsin traders until after the war of 1812. In this war they favored Great Britain, and in 1814 the latter wrested Prairie du Chien from an American detachment. But the formation of Astor's American Fur Company to deal in this region was followed by a United States law excluding English traders, which resulted in an increase of American influence. At the close of the war the United States placed forts at Green Bay and Prairie du Chien. By the ordinance of 1787 Wisconsin had been a part of the territory northwest of the river Ohio; in 1800 it was included in Indiana Territory, whence in 1809 it passed to Illinois Territory, and in 1818 to Michigan Territory. In 1825 the lead-mines in southwestern Wisconsin, which had been known from the earliest days of French exploration, and had been worked by the Sacs and Foxes and by Winnebagoes, attracted a considerable mining population. Hostilities with the Winnebagoes followed, resulting in the cession by the latter of the lead region, and the erection of Fort Winnuebago in 1828 at Portage. In 1832 occurred Black Hawk's War, occasioned by the refusal of a Sac band to remove beyond the Mississippi from Illinois, in accordance with treaty stipulations. Pursued by regulars and Illinois militia to the head-waters of Rock river, the band fled across southwestern Wisconsin to the Mississippi, where they were nearly exterminated. This expedition disclosed the rich farming lands of the region. In 1836 Wisconsin Territory was formed. Before this the fur trade and lead-mining had been the chief factors in development, but a wave of land speculation and immigration reached here at this period. In 1840 there was a population of 30,945, more than double that of four years before. On August 9, 1846, Congress authorized Wisconsin to form a State government. The constitution framed in 1846 being rejected by the people, a second one was ratified in 1848, and Wisconsin became a State on May 29 of that year.

At an early period the State adopted the policy of attracting immigration by cheap lands, a work in which the railroads have greatly aided, with the result that Wisconsin has the remarkable proportion of persons of foreign parentage indicated above. There are whole communities of the same foreign nationality,—such as the German groups along the shore of Lake Michigan, the Scandinavian in various localities, the Swiss colony of New Glarus, the Belgians in Door county, and many others. The recent development of lumbering has rapidly built up northern Wisconsin, a process now being accelerated by the mining interests on the Montreal range. Wisconsin furnished to the Union armies in the civil war over 91,000 men, the famous Iron Brigade being chiefly from that State.

(F. J. T.)

WISHAW, a police burgh of Lanarkshire, Scotland, and an important mining and iron town, is situated on the face of a hill, a short distance south of the South Calder water, and on the Caledonian Railway, 12 miles east-southeast of Glasgow. It is rather irregularly built, but contains some spacious streets, although the majority of the houses are inhabited by the working classes. It has numerous churches belonging to the different denominations, and a public library. Wishaw has risen to importance since the development of the coal and iron industry within recent years. The coal-pits of the district are among the most extensive in Scotland, and in the town there are iron and steel works, malleable-iron works, fireclay works, and a distillery. Wishaw was created a police burgh in 1855, and in 1874 the limits of the burgh were extended so as to include the villages of Cambusnethan and Craigneuk. The population of Wishaw according to its old limits was 8812 in 1871 and 8953 in 1881, that of the extended area in 1881 being 13,112, of which 1829 belonged to Cambusnethan and 2330 to Craigneuk. The town has borne in succession the following names: New Town of Cambusnethan, New Town of Wishaw, Wishawtown, and Wishaw.

WISMAR, the second commercial town and seaport of Mecklenburg-Schwerin, Germany, is situated on the Bay of Wismar, one of the best harbors on the Baltic, 18 miles almost due north of Schwerin. The town is well and regularly built, with broad and straight streets, and contains numerous handsome and quaint buildings in the northern Gothic style. The church of St. Mary, a Gothic edifice of 1353, with a tower 260 feet high, and the church of St. Nicholas (1381–1460), with very lofty vaulting, are regarded as good examples of the influence exercised in these northern provinces by the large church of St. Mary in Lübeck. The elegant cruciform church of St. George dates from the 14th and 15th centuries. The Fürstenhof, at one time a ducal residence but now occupied by the municipal authorities, is a richly decorated specimen of German Renaissance. Built in 1554, it was restored in 1877–79. The "Old School," dating from about 1300, has been restored, and is now occupied as a museum. The chief manufactures of Wismar are iron, chicory, cigars, roofing-felt, asphalt, etc. Fishing and agriculture are carried on by the inhabitants, but their main industry is connected with shipping and trade. The leading exports are grain, oil-seeds, butter, and cattle; the imports are coal, timber, iron, stoneware, and lime. The harbor is deep enough to admit vessels of 16-feet draught. In 1886 the port owned 35 ships (2 steamers), of 8302 tons burden; in 1875, however, it had 46 ships, with a total burden of 10,447 tons. The population, 6009 in 1810 and 14,462 in 1875, was 16,011 in 1885.

Wismar is said to have received town-rights in 1229. In the 13th and 14th centuries it was a flourishing Hanse town, with important woollen factories. Though a plague carried off 10,000 of the inhabitants in 1376, the town seems to have remained tolerably prosperous until the 16th century. By the peace of Westphalia in 1649 it passed to Sweden, along with a barony to which it gives name. In 1803 Sweden pledged both town and barony to Mecklenburg for a sum of money, reserving, however, the right of redemption after 100 years. In view of this contingent right of Sweden, Wismar is not represented in the diet of Mecklenburg; but it still enjoys some of its ancient rights and privileges as a free town.

WITCHCRAFT. This subject has already been considered in its general aspects under ASTROLOGY, DEMONOLOGY, DIVINATION, MAGIC, and SPIRITUALISM. In this place what will be mainly attempted will be to illustrate the position assumed by the law towards a crime which was regarded for centuries not only as possible but also as specially noxious. It is a long interval from the Twelve Tables to the Bill of Rights, but the lawyers of the latter age accepted the existence of witchcraft with a faith almost as unquestioning as those of the former, and comparatively few were they, whether lawyers or laymen, who in the interval dared to raise their voices against the prevailing superstition. The writings of Shakespeare and the other Elizabethan dramatists are sufficient of themselves to show the universal prevalence of the belief in England. For the purposes of this article witchcraft may be taken to include any claim of a power to produce effects by other than natural causes. By whatever name such a power might be called in a particular case, whether witchcraft, conjuration, sorcery, incantation, divination, or any similar name, the legal effects attaching to its supposed exercise were usually the same. Witchcraft was the most comprehensive English name, *sortilegium* the most comprehensive in ecclesiastical Latin.

In Roman law it was provided by the Twelve Tables that no one should remove his neighbor's crops to another field by incantation or conjure away his corn. At a later date the *Lex Cornelia de Sicariis et Veneficis* was extended by decree of the senate to cases of offering sacrifice to injure a neighbor.[1] Exercise of magical and diabolical arts rendered the magicians themselves liable to be burned alive, and those who consulted them to crucifixion. Even the possession of magical books was criminal. To administer a love potion, even though harmless, was punished by labor in the mines, or relegation and fine in the case of persons of rank.[2] One title of the *Code* of Justinian is entirely taken up with the subject.[3] Astrologers (*mathematici*) seem to have been specially objectionable to both the pagan and Christian emperors. Sorcery was punished by Constantine with banishment, or death by burning; and an accusation of witchcraft, as of treason, rendered every one, whatever his rank, liable to torture. To teach or to learn magic art was equally criminal. The only exceptions allowed (and these were afterwards removed by Leo[4]) were magic remedies for disease and for drought, storms, and other natural phenomena injurious to agriculture. A constitution of Honorius and Theodosius in 409 rendered *mathematici* liable to banishment unless they gave up their books to be burned in the presence of a bishop.[5] The trial of APULEIUS (*q.v.*) for magic in 150 A.D. is the most familiar instance occurring under Roman law.

The church followed and amplified Roman law. The graver forms of witchcraft constituted HERESY (*q.v.*), and jurisdiction over such offences was claimed by the church courts to a comparatively late date.[6] This authorization of belief in witchcraft was based partly on well-known texts of the Mosaic law—especially Exodus xxii. 18,—partly on peculiar constructions of other parts of Scripture, such as 1 Cor. xi. 10, where the words "because of the angels" were supposed to prove the reality of the class of demons called *incubi*.[7] What kinds of witchcraft were heresy was a question learnedly discussed by Farinaccius and other writers on criminal law. The practical effect of this mode of regarding witchcraft was that, although according to the better opinion the offence was in itself the subject of both secular and ecclesiastical cognizance, in fact it was on the continent of Europe seldom punished by the secular power, except as the mere executive of ecclesiastical sentences. The earliest ecclesiastical decree appears to have been that of Ancyra, 315 A.D., condemning soothsayers to five years' penance. In canon law the *Decretum* subjected them to excommunication as idolaters and enemies of Christ, and the bishop was to take all means in his power to put down the practice of divination.[8] The *Decretals* contained, among others, the provision that a priest seeking to recover stolen goods by inspection of an astrolabe might be suspended from his office and benefice.[9] In the 14th century John XXII. published a bull against witchcraft. In the 15th a vigorous crusade was begun by the bull "Summis desiderantes affectibus" of Innocent VIII. in 1484. Under the authority of this bull Sprenger and Krämer (Latinized into "Institor") were appointed inquisitors, and five years later they published the famous work *Malleus Maleficarum* or *Hexenhammer*, the great text-book on procedure in witchcraft cases, especially in Germany.[10] The third part of the work deals with the practice at length. One or two of the more interesting points of practice deserve a brief notice. Witnesses incompetent in ordinary cases were on account of the gravity of the offence admissible on a charge of witchcraft against but not for the accused. An alleged witch was to be conjured by the tears of our Saviour and of our Lady and the saints to weep, which she could not do if she were guilty. The authors explain that witchcraft is more natural to women than to men, on account of the inherent wickedness of their hearts. In the Roman and Greek Churches the form of EXORCISM (*q.v.*) still survives,[11] and was acknowledged by the Church of England as lately as 1603. The 72d canon of that year forbade attempts by the clergy at casting out devils by fasting and prayer unless by special license from the bishop. No such canon appears among the Irish canons of 1634. On one occasion in 1612 punishment of the exorcised demons was attempted. The bishop of Beauvais, in a document which Garinet has preserved, pronounced sentence of excommunication against five such demons.[12]

England.—As in other countries, ecclesiastical law claimed cognizance of witchcraft as a crime against God. The *Penitentials* of Archbishops Theodore and Egbert and the *Confessional* of Egbert are full of condemnations of magic divinations, diabolical incantations, love-philters, etc. An exception is made in favor of incantation by a priest by means of the Lord's prayer or the creed. The practice of magic by women is set out in the same document with minute and disgusting detail. After the Conquest, commissions were from time to time issued empowering bishops to search for sorcerers. A form of such a commission to the bishop of Lincoln in 1406 is given by Rymer.[1] The ecclesiastical courts punished by penance and fine up to 1542.[2] For graver punishments the secular power acted as executive. Many persons guilty of sorcery were, according to Sir Edward Coke,[3] burned by the king's writ *de hæretico comburendo* after condemnation in the ecclesiastical courts. The secular courts dealt with witchcraft from a very early period. It was an indictable offence at common law and later by statute, though apparently not a felony until the Act of Henry VIII. The earliest trial recorded in England was in a secular court. In 1324 several persons were appealed before the coroners of the king's household, and the record, certifying acquittal by a jury, was then brought up by writ of *certiorari*.[4]

[7] A reference to the *incubus* as a matter of common knowledge occurs in the prologue to Chaucer's *Wife of Bath's Tale*.

[8] Pt. ii. caus. xxvi. qu. 5.

[9] Bk. v. c. 21 (*De Sortilegiis*).

[10] The practice was also regulated by instructions promulgated by the Inquisition. A code of such instructions framed in 1657 will be found in the later editions of *Cautio Criminalis* (see below).

[11] The extraordinary minuteness of detail by which the practice of exorcism was regulated, even in the last century, appears from a curious little Portuguese book by Brognolo, *Methodo de exorcizar expelindo Demonios* (Coimbra, 1727).

[12] For the Roman and ancient church law, see Smith's *Dict. of Antiquities*, s.vv. "Magica," "Mathematici," and *Dict. of Chr. Antiq.*, s.v. "Magic."

In proceedings against a woman the doctrine of coercion by the husband (see WOMEN) did not apply. A distinction, more curious than important, was drawn between conjurers, witches and sorcerers. Conjurers by force of magic words endeavored to raise the devil and compel him to execute their commands. Witches by way of friendly conference bargained with an evil spirit that he should do what they desired of him. Sorcerers or charmers, by the use of superstitious forms of words or by means of images or other representations of persons or things, produced strange effects above the ordinary course of nature. Legislation on the subject began in the pre-Conquest codes. Thus the laws of Ethelred banished witches, soothsayers, and magicians. The laws of Canute included love-witchcraft under heathendom. It was evidently regarded as a survival of paganism. The first Act after the Conquest was passed in 1541 (33 Hen. VIII. c. 8), which dealt with a somewhat remarkable mixture of offences. It declared felony without benefit of clergy various kinds of sorceries, discovery of hidden treasure, destruction of a neighbor's person or goods, making images and pictures of men, women, children, angels, devils, beasts, and fowls, and pulling down crosses. The Act having been repealed at the accession of Edward VI., another Act on similar lines but distinguishing different grades of witchcraft was passed in 1562. By this Act, 5 Eliz. c. 16, conjuration and invocation of evil spirits, and the practice of sorceries, enchantments, charms, and witchcrafts, whereby death ensued, were made felonies without benefit of clergy and punishable with death. If only bodily harm ensued, the punishment for a first offence was a year's imprisonment and the pillory, and for a second, death. If the practice was to discover hidden treasure or to provoke to unlawful love, the punishment for a first offence was the same as in the last case, for a second imprisonment for life and forfeiture of goods. At the accession of James I., perhaps in compliment to the king's position as an expert and specialist in the matter, was passed 1 Jac. I. c. 12, which continued law for more than a century. The strange verbiage of the most important section of the Act is worth quoting in full. "If any person or persons shall use, practice, or exercise any invocation or conjuration of any evil and wicked spirit, or shall consult, covenant with, entertain, employ, feed, or reward any evil and wicked spirit to or for any intent or purpose, or take up any dead man, woman, or child out of his, her, or their grave, or any other place where the dead body resteth, or the skin, bone, or any part of any dead person, to be employed or used in any manner of witchcraft, sorcery, charm, or enchantment, or shall use, practice, or exercise any witchcraft, enchantment, charm, or sorcery, whereby any person shall be killed, destroyed, wasted, consumed, pined, or lamed in his or her body or any part thereof," every such offender is a felon without benefit of clergy. The Act further punished with imprisonment for a first offence, and for a second made it felony without benefit of clergy, to declare by witchcraft where treasure was, to provoke to unlawful love, or to attempt to hurt cattle, goods, or persons. This Act was repealed in 1736 by 9 Geo. II. c. 5. It will be noticed that in all the Acts it was necessary (except in the case of love-philtres) that injury should have been caused or intended or gain made. There were statutes which, although not directly concerned with witchcraft, aimed at the suppression of analogous offences. Thus multiplication of gold and silver (by means of the philosopher's stone) was made felony in 1403 by 5 Hen. IV. c. 4. This was repealed by 1 Will. and M. c. 30,—it is said, by the influence of Robert Boyle. Numerous Acts dealing with the practice of palmistry and fortune-telling by Egyptians or Gypsies were passed at different times, beginning in 1530 with 22 Hen. VIII. c. 10. They are now superseded by the provisions of the Vagrant Act of 1824.

Trials for witchcraft in England do not seem to have been proportionately as numerous or to have been accompanied with such circumstances of cruelty as those in most other countries. This may be accounted for partly by the diminishing authority of the church courts, partly by the absence of TORTURE (*q.v.*) as a recognized means of procedure, though no doubt it was too often used in an informal manner. The pricking of the body of an alleged witch by Hopkins the witch-finder and similar wretches in order to find the insensible spot or devil's mark, the proof by water (a popular survival of the old water ordeal), and similar proceedings, if not judicial torture, at least caused as much pain to the victims. Charges of witchcraft seem to have been made with great frequency against persons of rank during the Wars of the Roses for political purposes. The cases of the duchess of Gloucester and Jane Shore will at once occur to the mind, and neither Edward IV. nor his queen were exempt. The duke of Clarence was accused of imputing witchcraft to the former; and the latter and her mother, the duchess of Bedford, were charged with having obtained the promise of marriage from the king by magical means. Trials in England were most numerous in the 17th century. In the case of the Lancashire witches in 1634 seventeen persons were condemned on the evidence of one boy. In the period from 1645 to 1647 between two and three hundred are said to have been indicted in Suffolk and Essex alone, of whom more than half were convicted.[5] The *State Trials* contain several instances of such trials, viz., those of Anne Turner in 1615,[6] and the countess of Somerset in 1616[7] (where a charge of witchcraft was joined with the charge of poisoning Sir Thomas Overbury), Mary Smith in 1616,[8] the Essex witches in 1645,[9] the Suffolk witches in 1665,[10] and the Devon witches in 1682.[11] The most interesting trial is that of the Suffolk witches, because Sir Matthew Hale was the judge and Sir Thomas Browne was the medical expert witness.[12] In many of these trials the accused confessed before execution. The reasons which urged them to confess not only impossibilities, but impossibilities of the most revolting kind, are not very easy to discover. In some cases, no doubt, the object was to escape the misery of life as a reputed witch. The theory of witchcraft, too, was universal and well known, and the revolting details of worship of the devil and of the witches' sabbath must have been familiar to all. Torture, as the Milan case shows (see TORTURE), might force from the accused confession of an impossible crime, and even without torture instances have been known in modern times where women have charged themselves with offences in which they were the only believers.[1] These considerations may partially, if not fully, solve a difficulty which has been felt ever since the time of Cardan.

[12] In this case, tried at the assizes at Bury St. Edmunds on March 16, 1664-65, two widows named Rose Cullender and Annie Duny were accused of bewitching young children. The main points of the evidence were these. There had been a quarrel between the accused and the parents of the children, and the accused had uttered threats against them. The children fell into fits and vomited crooked pins, and once one of them vomited a twopenny nail with a broad head; they cried out the names of the accused in their fits; they could not pronounce the words "Lord," "Jesus," or "Christ" in reading, but when they came to "Satan" or "devil" they cried, "This bites, but makes me speak it right well." One of the children fell into a swoon after being suckled by one of the accused, and out of the child's blanket fell a great toad which exploded in the fire like gunpowder, and immediately afterwards the alleged witch was seen sitting at home maimed and scorched. Evidence of finding the witch's mark was given, and then evidence of reputation, viz., that the accused,

Towards the end of the 17th century the feeling towards witchcraft began to change. The case of Hathaway in 1702 no doubt accelerated the decay of the old belief. He was convicted of cheating and assault by falsely pretending to be bewitched and by making an attack on an alleged witch.[2] The last trial in England was that of Jane Wenham in 1712, convicted at Hertford, but not executed. A case said to have occurred in 1716 does not rest on good authority. This change of feeling was no doubt caused to a great extent by the works of writers, few in number but strong in argument, who from the time of Reginald SCOT (*q.v.*) struck at the very foundations of the popular belief. One of the most interesting but least-known writers is George Gifford, whose views are in the nature of a compromise. His point is that the devil may deceive not only witches but their accusers.[3] The jury who convict may sometimes be right, but it must be very seldom. As lately as 1718 Dr. Hutchinson, bishop of Down and Connor, thought it worth while to argue against witchcraft, but rather from the popular than the scientific point of view.[4] Legal writers did little to shake the prevailing opinion. Coke, Bacon, and Hale certainly admitted the possibility of witchcraft; Selden at least approved the statutory provisions on the subject; and Blackstone, in guarded language, said that its exclusion from the list of crimes was not to be understood as implying a denial of the possibility of such an offence, though, following Addison, he would not give credit to any particular modern instance.

In the present state of the law pretended supernatural powers may be such as to bring those professing them under the criminal law, or to make void a transfer of property caused by belief in their existence. The Act of 1736 enacted that any person pretending to use witchcraft, tell fortunes, or discover stolen goods by skill in any occult or crafty science, was to be imprisoned for a year, to stand in the pillory, and to find sureties for good behavior. This is still law, except as to the pillory. By the Vagrant Act of 1824, 5 Geo. IV. c. 83, s. 4, any person pretending or professing to tell fortunes, or using any subtle craft, means, or device, by palmistry or otherwise, to deceive and impose on any of Her Majesty's subjects, is to be deemed a rogue and vagabond. Under this Act a person may be convicted for attempting to deceive by falsely pretending to have the supernatural faculty of obtaining from invisible agents and the spirits of the dead answers, messages, and manifestations of power, viz., noises, raps, and the winding up of a musical box.[5] So may one who issues an advertisement professing to forecast the future, though no money is received, and the future of a particular person is not told.[6] A false pretence of witchcraft is also punishable under the Larceny Act of 1861, 24 and 25 Vict. c. 96. It has been held that a false pretence that the defendant had the power to bring back the husband of the prosecutrix over hedges and ditches was within the statute.[7] In a case in Chancery in 1868 a widow lady, aged seventy-five, was induced by the defendent, a spiritual medium, to transfer a large sum of money to him, under the belief that such was the wish of her deceased husband as declared in spiritualistic manifestations. The court held that his claim of supernatural power constituted undue influence, and that the gift must be set aside.[8]

See, in addition to the authorities cited, Sir Walter Scott's *Letters on Demonology and Witchcraft;* Stephen, *Hist. of the Criminal Law*, vol. ii. ch. xxv.; Pike, *Hist. of Crime in England*, esp. vol. ii. p. 131 *sq.;* Dr. Nicholson's Introduction to Reginald Scot's *Discovery of Witchcraft:* Spalding, *Elizabethan Demonology*, ch. iii.; also reports of particular cases, such as the trial of the Suffolk witches, published in a separate form in 1682, and the indictment of the astrologer Lilly for advising to recover stolen goods (when the grand jury threw out the bill), to be found in his autobiography.

Scotland.—The principal Act of the Scottish parliament was 1563, c. 73 (ratified and confirmed in 1649), making it a capital offence to use witchcraft, sorcery, or necromancy, or to pretend to such knowledge, or to seek help from witches. It was repealed by 9 Geo. II. c. 5. Trials were either before the ordinary courts or, more frequently, before special tribunals erected by the authority of commissions from time to time issued by the privy council, often on the petition of a presbytery or the General Assembly. Boxes were placed in the churches to receive accusations. The frequency of cases is shown by an order of parliament in 1661 that justices depute should go once a week at least to Musselburgh and Dalkeith to try persons accused of witchcraft. In these trials evidence of the wildest description was admitted. Anything was relevant, especially if sworn to by a professed witch-finder or witch-pricker, a position in which one Kincaid, like Hopkins in England, attained special eminence. Torture was used in most cases, and in an aggravated form, as it was supposed that the devil protected his votaries from the effects of ordinary torture. A special form of iron collar and gag called "the witch's bridle" was generally used. The details of the trials in Pitcairn's *Criminal Trials* are utterly revolting, especially those of Bessie Dunlop in 1576 and of Dr. Fian in 1590. One of the charges in the former case is very remarkable, and the accused herself confessed it, that she acted under the guidance of the spirit of Thome Reid who had been killed at Pinkie in 1547. In some cases a charge of witchcraft was joined with a charge of another crime, as of murder in the master of Orkney's case, of treason in Dr. Fian's, accused of raising a storm at sea when the king was on a voyage.[9] James VI. was frequently present in person at trials for witchcraft, and the most horrible cases recorded are those which occurred in his reign. The full pleadings in a charge are given in the case of Margaret Wallace.[10] It is noticeable that the articles of dittay began by resting the criminality of sorcery upon the divine law as contained in the 20th chapter of Leviticus and the 18th chapter of Deuteronomy. The punishment was generally burning. The last execution took place in 1722, after conviction before the sheriff of Sutherland. As to pretended powers, the Act of 1736 applies to Scotland, and at common law obtaining

---

besides being themselves accounted witches, had had some of their kindred condemned as such. A farmer swore that once when his cart had touched Cullender's house it overturned continually and they could not get it home. Sir Thomas Browne testified that the swooning fits were natural, heightened to great excess by the subtlety of the devil co-operating with the witches. Experiments upon the children were then made in court by bringing them into contact with the witches and others. These were of so unsatisfactory a nature that many present openly declared that they thought the children impostors. The chief baron in his summing up said that there were such creatures as witches was undoubted, for the Scriptures affirmed it and the wisdom of nations had provided laws against such persons. The report alleges that after conviction of the accused the children immediately recovered.

[1] A remarkable instance is a case of Robinson *v.* Robinson and Lane (to be found in the Divorce Court Reports in 1859), where purely imaginary acts of adultery were recorded by the respondent in her diary.

[9] All these cases will be found in vol. i. of Pitcairn. In one case (noted at p. 216), a jury having acquitted an accused woman who had confessed under torture, the king had them tried for wilful error.

[10] Pitcairn, vol iii. p. 508

money by pretending to tell fortunes or recover property by enchantment is punishable as falsehood, fraud, and wilful imposition.

See, further, Sir Walter Scott's *Letters*; appendix vii. to Pitcairn; the *Register of the Privy Council of Scotland, passim;* Buckle, *Hist. of Civilization*, vol. ii. p. 190.

Ireland.—The earliest recorded case is in the same year as the earliest in England, 1324, but in an ecclesiastical and not as in England in a secular tribunal. It was a proceeding against Dame Alice Kyteler and others in the bishop of Ossory's court, which led to a considerable conflict between the church and the civil power.[1] The English statute of Elizabeth was adopted almost word for word by 28 Eliz. c. 2. (I.). The only other Act of the Irish parliament bearing on the question was 10 Car. I., sess. 2, c. 19 (I.), enacting that if a person bewitched in one county died in another the person guilty of causing his death might be tried in the county where the death happened. It is remarkable that this Act is based upon an English Act, 2 and 3 Edw. VI. c. 24, dealing with the venue in criminal trials, but the English Act does not mention witchcraft. 28 Eliz. c. 2 was not repealed until 1821 by 1 and 2 Geo. IV. c. 18, so that Ireland appears to be distinguished as the last country in which penalties against witchcraft were retained in statute law.

United States.—The earliest execution in New England is said to have been in 1648. In the abstract of the laws of New England printed in 1655 appear these articles: "III. Witchcraft, which is fellowship by covenant with a familiar spirit, to be punished with death. IV. Consulters with witches not to be tolerated, but either to be cut off by death or banishment or other suitable punishment."[2] The fanatical outbreak at Salem in 1691-92 is one of the most striking incidents in the history of New England. Nineteen persons were executed for witchcraft, among whom was Giles Cory, the only person who ever perished by the *peine forte et dure* in America (see TORTURE). In 1692 fifty were tried, but only three convicted, and they received the governor's pardon. For these proceedings the writing and preaching of Cotton Mather were largely responsible. The States have now their own legislation against pretended supernatural powers. Provisions similar to those of the English Vagrant Act are common.

A full account of the proceedings at Salem will be found in Hutchinson's *Hist. of Massachusetts Bay* (vol. ii. ch. 1), in Bancroft's *Hist. of the Colonization of the United States* (iii. 84), and in Cotton Mather's *Memorable Providences* (Boston, 1689) and *Wonders of the Invisible World* (Boston, 1693). [See also S. G. Drake's *Annals of Witchcraft in New England* (1869).—AM. ED.]

Continental States. — The law against witchcraft was minutely treated by continental jurists of the 16th and 17th centuries, especially by those who, like Farinaccius and Julius Clarus, were either churchmen or laymen holding ecclesiastical appointments. The extent to which legal refinement could go is well illustrated by the treatise on criminal law by Sinistrari de Ameno,[3] an Italian writer of the 17th century, whose belief in sorcery is strikingly shown by his strange work on the subject called *Dæmonialitas.*[4] He defines *sortilegium* as "actus humanus quo per media inutilia aut vetita aliquis effectus procuratur ad damnum aut utilitatem propriam aut alienam." Six species, it appears, were recognized, called *amatorium, defensorium, revelatorium, lucratorium, malefactorium, divinatorium.* There were eleven distinct modes of profession to the service of the devil. Some of the *indicia* on which torture might be inflicted were absence of the accused from bed during the night, drawing cabalistic signs on the ground, threats of injury, anointing the body. The text of Roman law was sometimes distorted in an extraordinary way: *e.g.*, it was a maxim that a contract with a demon was not binding, and this was expressed in the language of Roman law in the formula "in dæmonem cadere non potest obligatio." In Germany the ecclesiastical courts generally acted, though the crime was sometimes the subject of secular legislation, especially in the *Constitutio Criminalis* of Charles V. (the *Carolina*).[5] The number of victims perhaps exceeded that in any other country. It was in Germany too that the last execution for witchcraft in Europe took place, at Posen in 1793. In France prosecutions for *vauderie* occurred in the 13th and 14th centuries. In the 15th century Joan of Arc was condemned on a charge of witchcraft.[6] Henry III., like Edward IV. of England, was accused by his enemies of practicing sorcery. The most numerous prosecutions were set on foot in the 17th century, and as in other countries they met with the firmest support from some literary men, among whom P. de l'Ancre is conspicuous for his orthodoxy.[7] A royal edict of 1682 revived all previous ordinances against the practice of sorcery and divination, and punished with corporal punishment any persons consulting sorcerers, with death those who exercised magic themselves. The "Chambre Ardente" tried some cases, and the last case ever brought before such a tribunal resulted in the condemnation in 1680 of a woman named Voisin for sorcery and poisoning in connection with the Marquise de Brinvilliers. The law against sorcery held its place in French legal works to at least the middle of the last century. It was treated at length both by the Sieur de Lamarre[8] and by Muyart de Vouglans.[9] The latter distinguishes white from black magic, the black magic only being criminal as a part of the larger offence of *lèse-majesté divine*, which included also heresy, blasphemy, and perjury. Burning was the usual punishment. Among the more remarkable of the *indicia* upon which torture might be inflicted was the finding on the premises of the accused instruments of magic, as wax figures transfixed with needles, feathers in the form of a circle, or a written pact with the devil. Pretended exercise of magic is now punished by the *Code Pénal.* A very curious case of slander is mentioned by Merlin.[10] It was tried in 1811 in the department of Yonne. The slander consisted in an allegation by the defendant that the complainants had danced around the devil, who was seated on a gilded arm-chair as president of the dance. The tribunal of police thought the matter more a subject of ridicule than of injury and dismissed it, but his judgment was quashed by the court of cassation on the ground that the charge was one which might trouble the public peace. In Spain and Italy there is a considerable body of legislation on the subject of witchcraft. For instance, the code of the *Siete Partidas*[11] in Spain punished with death those who acted as diviners or witches, especially in love matters. A distinction was drawn between divination by astronomy, which was legitimate, and that by augury from birds or by incantation over water or a mirror. On the Continent, as in England, there was during two centuries a steady flow of literary attack on the reasonableness of belief in witchcraft. The earliest attack was made in Germany, the country which had distinguished itself by the vigor of its prosecutions of the crime. Cornelius Agrippa, in his *De Occulta Philosophia* was not entirely orthodox on the subject; and it was more directly treated in the *De Præstigiis Dæmonum* of Johann Wier or Weier in 1563, twenty-one years earlier than Reginald Scot's work. Wier was followed in the next century by Father Frederick Spee[12] in Germany, and by B. BEKKER (*q.v.*) in the Netherlands. The work of Spee, orginally published anonymously, appears to have caused a great sensation at the time, and to have caused a relaxation of prosecutions in order to give opportunity for further inquiry. The work takes the form of fifty-two doubts, the first of which is "An Sagæ Striges seu Malefici revera existant?" The general conclusion is that, although witches exist in general, the question of their operation in particular cases is open to so much doubt that it would be well to suspend proceedings for a time. The writer did not profess entire disbelief, as did Bekker. The main idea of *De Betooverde Wereld* of the latter is that good and evil spirits could have no effect or influence on earthly affairs, for spirit could not act on matter. All prosecutions for witchcraft were therefore unjust, and against the honor of God and the advantage of man. During the same period other writers both lay and legal treated the question incidentally. Montaigne was skeptical; Montesquieu, while not actually intimating disbelief, enjoined the greatest care in trying accusations. As in England, the current of literary feeling was not uniformly opposed to popular belief, for Wier was answered by Bodin, and

A full account of an ordinary trial for witchcraft will be found in the work. One of the most shameful parts of it, the stripping and shaving of an alleged witch, meets with the author's strongest reprobation.

Luther and other eminent writers no doubt had full faith in the existence of witchcraft.

See Lecky, *Hist. of Rationalism in Europe*, vol. i. ch. i., where an immense number of authorities are cited; works on magic, such as those by Delrio and Garinet: Scheltema, *Geschiedenis der Heksenprocessen*, Haarlem, 1828; Soldan, *Geschichte der Hexenprocesse*, Stuttgart, 1843; and various reports of particular trials, *e.g.*, the proceedings against fifty-three magicians at Logroño in Castile in 1610, by P. de l'Ancre (Paris, 1612), the trials in Sweden in 1669 and 1670, by Dr. Anthony Horneck (London, 1700), the proceedings against G. Kobbing at Coesfeld in 1632, by Neisert (Coesfeld, 1827), and *Les Procédures de Sorcellerie à Neuchâtel*, by Lardy (Neuchâtel, 1866). (J. W†.)

WITENAGEMOT. See England, vol. viii. p. 249.

WITHER, George (1588–1667), appears in the *Dunciad* as "sleeping among the dull of ancient days, safe where no critics damn." The once ardent poet's slumbers were disturbed towards the close of the 18th century by George Ellis, who in his *Specimens* resuscitated some of Wither's poetry, not to condemn but to praise. Thereafter he was speedily released from Pope's limbo. Wordsworth prefixed a dozen of Wither's most exquisite lines to his own poem *To the Daisy;* Southey quoted him eulogistically; Brydges republished a selection of his poems, and searched out the facts of his life; Park made a list of his voluminous writings, over 100 in number, for *The British Bibliographer;* and, most fortunate stroke of all for Wither's memory, Charles Lamb wrote upon him one of his most delightful essays, re-creating and immortalizing the old poet's poetic spirit.[1] Wither's life was full of adventure. Born June 11, 1588, the son of a Hampshire gentleman, educated at Magdalen College, Oxford, he entered at Lincoln's Inn, conceived an ardent passion for poetry, put forward as a satirist in 1613 with *Abuses Stript and Whipt*, and was promptly lodged in the Marshalsea. It was the year of the Essex divorce case, when so plain a satirist, though he whipt abuses in the abstract, might easily have given offence. In prison he wrote *The Shepherd's Hunting*, the fourth eclogue of which contains his memorable praise of poetry. Wither's *Motto* was published in 1618; *Fair Virtue, or The Mistress of Philarete*, the longest, freshest, and most captivating lover's panegyric in the language, in 1622. When the civil war broke out, Wither took the side of the Parliament, sold his estate in Hampshire and raised a troop of horse, was taken prisoner and saved from death at the intercession of Denham, backed by a timely jest, was promoted and enriched by Cromwell, was stript of his possessions at the Restoration and thrown into prison, but released under bond for good behavior. Besides the poems above mentioned, which are the basis of Lamb's admiration, and his curious *Emblems*, published in 1635, Wither, a man of most radiant energy and eloquence, wrote a host of satirical and polemical tracts, for which readers may be referred to the *Bibliographer*. The famous song "Shall I, wasting in despair," occurs in *The Mistress of Philarete*. He died in London May 2, 1667.

WITHINGTON, a township of Lancashire, England, 4 miles south of Manchester, of which it is practically a suburb. It is chiefly occupied by better-class mansions and villas. The township is within the old parish of Manchester, but was formed into a separate ecclesiastical parish in 1854. The urban sanitary district includes part of the parish of Withington and three other parishes (area 5728 acres), the population being 10,099 in 1871 and 17,109 in 1881. The population of the Withington portion (area 2229 acres) in 1871 was 4863, and in 1881 it was 9328.

WITNESS, in law, is a person, who gives or might give evidence in a court of justice. The law of witnesses is on the one hand a branch of the law of Evidence (*q.v.*), and on the other is closely connected with the Jury (*q.v.*), for the jurors were originally chosen for their knowledge or presumed knowledge of the facts in dispute. The part of the Scotch juror's oath "and no truth conceal" is an obvious survival of the time when the juror was a witness. It is only by gradual steps that the law has reached its present stage in the United Kingdom and the United States. At present the disabilities of witnesses are few; almost every one is a capable witness, and the main question has become one of credibility rather than of capability. It was far otherwise in Roman and ecclesiastical law and in the older law of England and Scotland. A reference to Torture will show that in Roman and mediæval law the testimony of many persons was not admissible without the application of torture. At the same time a large body of possible witnesses was excluded for reasons which have now ceased to be considered expedient, and was subject to rules which have long become obsolete. In Roman law witnesses must be *idonei*, or duly qualified. Minors, certain heretics, infamous persons (such as women convicted of adultery), and those interested in the result of the trial were inadmissible. Parents and children could not testify against one another, nor could slaves against their masters, or those at enmity with the party against whom their evidence was offered. Women and slaves were under a disability to be witnesses to a will. The canon law extended the disability to testify to an excommunicated person, and to a layman in a criminal charge against a clerk, unless he were actually the prosecutor. In the days of trial by battle a party could render a witness against him incompetent by challenging and defeating him in the judicial combat. A policy similar to that of Roman law was followed for centuries in England by excluding the testimony of parties or persons interested, of witnesses for a prisoner, and of infamous persons, such as those who had been attainted, or had been vanquished in the trial by battle, or had stood in the pillory. All these were said *vocem non habere*. Many systems of law excluded witnesses from policy of a local or temporary nature. Women (*q.v.*) were generally regarded as wholly or partially incompetent. The evidence of Jews was frequently rejected in Spain and other countries during the 14th and 15th centuries. In the United States, while slavery was lawful, the evidence of slaves (and in some States that of free persons of color) was not received for or against whites. There were in Roman law some hard and fast rules as to number. Seven witnesses were necessary for a will, five for a *mancipatio* or manumission or to determine the question whether a person were free or a slave. Five was also the number necessary under the *Liber Feudorum* for proving ingratitude to the lord. Two were generally necessary, as in the Mosaic law, as a minimum number to prove any fact. *Unius responsio testis omnino non audiatur* are the words of a constitution of Constantine. The evidence of a single witness was simply *semiplena probatio*, to be supplemented, in default of a second witness, by torture or by reference to oath. In the canon law the evidence of a notary was generally equivalent to that of two ordinary witnesses. The evidence of the pope and that of a witness who simply proved baptism or heresy (according to some authorities) are perhaps the only other cases in which canon law dispensed with confirmatory evidence. In England one witness is as a rule sufficient. But in certain cases two or more are necessary. Two must attest a marriage or a will,[2] and two are necessary for a conviction of perjury, treason, and some other crimes, such as offences against the Act of Supremacy of Elizabeth. In the United States the number necessary for the attestation of a marriage or will is not uniform in all the States. Sometimes a special number has been fixed in England by statute in exceptional cases. A curious Act of Richard II., passed in 1383 (6 Ric. II. st. 2, c. 5), fixed the number of compurgators necessary to free an accused person from complicity in the peasant revolt at three or four. Corroborative evidence—not necessarily the evidence of another witness, but corroboration in a material particular—must in England be given to entitle the complainant or plaintiff to succeed in an affiliation summons or in an action for breach of promise of marriage. The evidence of an accomplice also needs confirmation, if not in strict law, at least in practice. The number of witnesses had in one instance in old Scotch law the curious effect of determining the punishment. By the assizes of King William, the ordeal of water was undergone by the accused on the oaths of three witnesses; if to them the oaths of three *seniores* were added, the penalty was immediate hanging. Witnesses need not now in English law be *idonei* or credible, except in the case of witnesses to bills of sale under the Bills of Sale Act, 1882. The "credible" of the Statute of Frauds has not been repeated in the Wills Act (see WILL). In the case of dishonor of a foreign bill of exchange the evidence of a notary is required, and a solicitor must attest a warrant of attorney, as was also required for a bill of sale from 1878 to 1882.

---

[1] The marginal notes forming the original MS. of this essay have recently been reproduced by Mr. Swinburne, *Miscellanies*, p. 157.

[2] The absence of two witnesses does not, however, avoid a marriage as it does a will. The section of 4 Geo. IV. c. 76 providing for the presence of witnesses at a marriage has been held to be merely directory.

The modern law of witnesses has been already treated to a considerable extent under EVIDENCE. It should be noticed that since the date of that article a new rule of great importance has received statutory sanction. The rules of the Supreme Court, 1883 (Ord. xxxvi., r. 38), enable the judge in all cases to disallow any questions put in cross-examination of any party or other witness which may appear to him to be vexatious and not relevant to any matter proper to be inquired into in the cause or matter. It will suffice here to give a brief statement of the law as it at present stands, rather by way of supplement to what has been already said than as an exhaustive notice. Witnesses may be either sworn or unsworn, either judicial or non-judicial, the unsworn and non-judicial almost coinciding. The evidence of judicial witnesses may be given *viva voce* or by deposition or affidavit, the latter being the more usual course in chancery and bankruptcy proceedings. Where evidence is taken on commission, the usual course where the witness is out of the jurisdiction, the questions and the witness's answers are produced in writing to the court which issued the commission, it being a delegation of the authority of the court. As a rule all witnesses coming before a court of justice, whether to give evidence as to a fact or a professional opinion, must be sworn (see OATHS).[1] To this rule certain exceptions exist at common law and have been introduced by statute, the one of the most importance being the law by which persons objecting to take an oath may affirm. Another exception was introduced by the Criminal Law Amendment Act, 1885, the Act allowing the evidence of a child of tender years to be received without oath. But to ensure a conviction such evidence must be corroborated. At common law a person merely producing documentary evidence need not as a rule be sworn. A witness, too, may be examined unsworn on the *voir dire*, as it is called, to decide the preliminary question of his competency. Non-judicial witnesses are those who attest an act of unusual importance, for the due execution of which evidence may afterwards be required. They are either made necessary by law, as the witnesses to marriages and wills, or used by general custom, as the witnesses to deeds. In some cases the attestation has become a mere form, such as the attestation of the lord chancellor to a writ of summons (see WRIT). Those witnesses whose evidence is not received may be divided into incompetent and privileged,—classes which must be carefully distinguished. The evidence of the former is wholly inadmissible; that of the latter is admissible if they waive their privilege. Among the incompetent witnesses are those of too tender years to understand the nature of an oath, idiots and lunatics, those convicted of perjury under an Act of Elizabeth (see PERJURY),[2] and accused persons or their husbands or wives (except where the trial is for treason or for personal injuries inflicted by one spouse against the other). The exclusion of the latter class has led to much discussion among English lawyers. In 1878 the Criminal Code Commission recommended that prisoners should be allowed to give evidence on their own behalf on oath. Several recent Acts have modified in some degree the rigor of the common law. The accused, or the husband or wife of the accused, may give evidence on oath in certain proceedings, nominally criminal, substantially of a civil nature, such as indictments for nuisance or non-repair of a highway (40 Vict. and 41 Vict. c. 14). The same is the case under the Merchant Shipping, Licensing, and Customs Acts, the Married Women's Property Act, 1882, the Criminal Law Amendment Act, 1885, the Merchandise Marks Act, 1887, and other Acts. Up to 1702 the prisoner was under the further disability of not being able to have his witnesses examined on oath. This harsh rule, borrowed from Roman law, was not abrogated in Ireland until 1711, in Scotland until 1735. Where a witness is competent, he is also compellable, except the king. The only privileged witnesses practically now recognized in England are high officers of state, executive or judicial, and members of the legal profession, who need not divulge what has been disclosed to them in professional confidence. Clergy and medical men are not privileged, though attempts have sometimes been made to protect disclosures to them, especially to priests in the confessional. Any witness is privileged from answering questions the answers to which might expose him to penalty or forfeiture or to a charge of adultery. Lists of witnesses intended to be called by the crown must be supplied to the accused in charges of TREASON (*q.v.*), and are generally on the back of the indictment in ordinary cases, though the prosecution is not bound to call them. In Scotland lists of the witnesses are supplied in all cases, and in the United States in capital charges.

The mode of securing the attendance of a witness is by subpœna (see WRIT) in civil actions in the High Court, by subpœna or RECOGNIZANCE (*q.v.*) before an assize court, by SUMMONS (*q.v.*) in a county court or court of summary jurisdiction. In exceptional cases attendance may be secured by writ of *habeas corpus ad testificandum* or by WARRANT (*q.v.*) of a secretary of state. In Scotland attendance is generally secured by citation. Disobedience to a subpœna is punishable as CONTEMPT OF COURT (*q.v.*).[3] False evidence renders the offender liable to the penalties of perjury. Various Acts of Parliament deal with compelling appearance before committees of Parliament, courts of martial, and other tribunals of a special nature. A witness is protected from any action for slander for words spoken in the witness box. He is also protected from arrest *eundo, morando, et redeundo.* The scale of allowances to witnesses depends upon orders of court made with the approval of the Treasury. It is graduated according to the social position of the witnesses. (J. W†.)

WITSIUS, HERMANN (1636–1708), Dutch theologian, was born February 12, 1636, at Enckhuysen, North Holland, studied at Utrecht, Leyden, and Groningen, and was ordained to the ministry in 1657. In 1675 he became professor of divinity at Franeker, and in 1680 he was translated to a corresponding chair at Utrecht. In 1685 he acted as chaplain to the Dutch embassy sent to London to congratulate James II. on his accession. In 1698 he succeeded Spanheim at Leyden, where he died on October 22, 1708.

Subjoined is a list of his more important works. *Judæus Christianizans,—circa Principia Fidei et SS. Trinitatem*, Utrecht, 1661; *De Œconomia Fæderum Dei cum Hominibus*, 1677 (often reprinted, both in Latin and in English, and still regarded as one of the clearest and most suggestive expositions of the so-called "federal" theology); *Diatribe de Septem Epistolarum Apocalypticarum Sensu Historico ac Prophetico*, Franeker, 1678; *Exercitationes Sacræ in Symbolum quod Apostolorum dicitur et in Orationem Dominicam*, Franeker, 1681; *Miscellanea Sacra*. Utrecht, 1692-1700 (2 vols. 4to).

WITT. See DE WITT.

WITTEN, a rapidly growing town of Westphalia, Prussia, is favorably situated among the coalfields of the Ruhr, 14 miles east of Essen and 15 miles north-east of Elberfeld. The coal-mines in the neighborhood provide abundant fuel for large cast-steel works, iron-foundries, railway workshops, machinery and boiler works, glass-works, distilleries, and other industrial establishments. In 1843 the population was 3444; in 1885 it was 23,903.

---

[1] The giving of evidence unsworn appears to have been at one time regarded as a privilege. The men of Ripon, for instance, were by a charter of Athelstan to be believed on their yea and nay in all disputes.

[2] A person convicted of perjury at common law is not on that account incompetent in England; his evidence may be given for what it is worth. It is otherwise in the United States, see Revised Statutes, § 5392. In France disability to be a witness may be inflicted as part of the punishment on conviction for certain crimes (see *Code Pénal*, § 42).

[3] In the ecclesiastical courts it was formerly punished by EXCOMMUNICATION (*q.v.*).

WITTENBERG, now an unimportant manufacturing town in the province of Saxony, Prussia, is situated 55 miles to the southwest of Berlin, on the Elbe, which is here spanned by a stone bridge 300 yards long, and by an iron railway bridge 320 yards long. The three suburbs which adjoin the town are not older than 1817. Wittenberg is interesting chiefly on account of its close connection with Luther and the dawn of the Reformation; and several of its buildings are associated with the events of that time. Part of the Augustinian monastery in which Luther dwelt, at first as a monk and in later life as owner with his wife and family, is still preserved, and has been fitted up as a "Luther museum." The Augusteum, built in 1564–83 on the site of the monastery, is now a clerical seminary. The Schlosskirche, to the doors of which Luther nailed his famous ninety-five theses in 1517, dated originally from 1490–99; it was, however, seriously damaged by fire during the bombardment of 1760, and has practically been rebuilt. The old wooden doors, burnt in 1760, are replaced by bronze doors, bearing the Latin text of the theses. In the interior of the church are the tombs of Luther, Melanchthon, and the electors Frederick the Wise and John the Constant. The parish church, in which Luther often preached, was built in the 14th century, but has been much altered since Luther's time. The present infantry barracks were at one time occupied by the University of Wittenberg, founded in 1502, but incorporated with the university of Halle in 1817. Luther was appointed professor of philosophy here in 1508; and the new university rapidly acquired a considerable reputation from its connection with the early Reformers. Shakespeare makes Hamlet and Horatio study at Wittenberg. The ancient electoral palace is another of the buildings that suffered severely in 1760; it now contains archives. Melanchthon's house and the house of Lucas Cranach the Elder (1472–1553), who was burgomaster of Wittenberg, are also pointed out. Statues of Luther and Melanchthon embellish the town. The spot, outside the Elstar Gate, where Luther publicly burned the papal bull in 1520 is marked by an oak tree. Woollen and linen weaving, stocking-making, leather-working, distilling, and brewing are carried on in Wittenberg. The formerly considerable manufacture of the heavier kinds of cloth has died out. The population in 1885 was 13,856; in 1816 it was 6206.

Wittenberg is mentioned as early as 1180.[1] It was the capital of the little duchy of Saxe-Wittenberg (vol. xxi. p. 368), the rulers of which afterwards became electors of Saxony; and it continued to be the chief town of Saxony under the Ernestine electors. The capitulation of Wittenberg (1547) is the name given to the treaty by which John Frederick the Magnanimous was compelled to resign the electoral dignity and most of his territory to the Albertine branch of the Saxon family. In 1760 the town was bombarded by the Austrians. In 1813 it was refortified by command of Napoleon; but in 1814 it was stormed by the Prussians under Tauentzien, who received the title of "Von Wittenberg" as a reward. Wittenberg continued to be a fortress of the third class until the reorganization of the German defences after the foundation of the new empire in 1871 led to its being dismantled.

WŁOCŁAWEK, or VLOTSLAVSK, a district town of the government of Warsaw, on the left bank of the Vistula, which is crossed by an iron bridge, 118 miles by rail to the N.W. of Warsaw. It was founded about 1139, and became known under the name of Vladislavia, or Old Ladislaus, as a centre for trade of some importance. Later on it fell into decay; but, owing to its position on the great water highway of Poland and on the railway connecting Warsaw with Berlin and Dantzic, its population has rapidly increased of late, and now amounts to 22,600. Its merchants carry on an active trade in grain. It has a fine cathedral, dating from the 14th century.

WOBURN, a town of Middlesex county, Massachusetts, United States, lies about 10 miles somewhat west of north from Boston; it comprises within its limits four villages of greater or less size, besides a small rural population. The town contains 75 miles of streets. The population in 1885 was 11,750, about three-tenths of foreign birth. The industries, which are largely manufacturing, are connected chiefly with the tanning of leather and the making of boots and shoes.

Woburn is one of the older towns of Massachusetts, having been settled in 1642. Its growth, however, was slow, and it is only in recent years that it has attained to importance.

WOELFL, JOSEPH (1772–1812), pianist and composer, was born in 1772 at Salzburg, where he studied music under Leopold Mozart and Michael Haydn. After a short residence at Warsaw he produced his first opera, *Der Höllenberg*, with some success at Vienna, where it was soon followed by *Das schöne Milchmädchen* and some other dramatic pieces. These, however, have been long forgotten, and his fame now rests upon his compositions for the pianoforte, and the skill with which he is said to have met their formidable demands upon his power as an executant. The perfection of his *technique* was immeasurably enhanced by the enormous stretch of his fingers; and to the wide grasp of the key-board this placed at his command he owed a facility of execution which he turned to excellent account, especially in his extempore performances. So remarkable were these that even the youthful Beethoven did not disdain to play in company with him at the house of Count Wetzlar, and in memory of this exhibition of good-humored rivalry he dedicated to Beethoven his Three Sonatas, *Op.* 6. Quitting Vienna in 1798 Woelfl exhibited his skill in most of the great European capitals, and, after spending some years in Paris, made his first[2] appearance in London, May 27, 1805. Here he enjoyed a long term of popularity, crowned about 1808 by the publication of his Sonata, *Op.* 41, containing some variations on "Life let us cherish." This, on account of its technical difficulty, he entitled *Non Plus Ultra*; and, in reply to the challenge, Dussek's London Publishers reprinted a sonata by that composer, originally called *Le Retour à Paris*, with the title *Plus Ultra*, and an ironical dedication to *Non Plus Ultra*. Woelfl died in Great Marylebone Street, London, May 21, 1812. Some stories once current concerning his ruin by a card-sharper and death upon a heap of straw are proved to have been utterly without foundation.

WÖHLER, FRIEDRICH (1800–1882), chemist, was born on July 31, 1800, in Eschersheim, near Frankfort-on-the-Main. While attending the village school of Rödelheim, he received valuable additional instruction from his father, a man of more than ordinary acquirements. In 1812 the family removed to Frankfort, where he entered the gymnasium, and by the kindness of a scientific friend, Dr. Buch, was introduced to the study of mineralogy, chemistry, and physics. He afterwards studied medicine at Marburg and Heidelberg, graduating in that faculty at the latter university. Having, on the advice of Leopold Gmelin, decided upon devoting himself henceforth to chemistry, he completed his chemical education at Stockholm, under Berzelius, in whose laboratory he worked for a considerable time, and with whom, during his subsequent life, he maintained the most friendly relations. While in Sweden he took part in a scientific expedition through Norway, which made him acquainted with the brothers Brongniart and with Humphrey Davy.

After his return from Sweden in 1825, he accepted a call to Berlin as teacher of chemistry in the then newly-erected "gewerbschule," and remained there until 1832, when family affairs caused him to take up his abode in Cassel. In 1836 Wöhler became professor of chemistry in the medical faculty of the university of Göttingen, which office, in his case, was combined with that of inspector-general of pharmacy for Hanover. He held his chair till his death, which occurred, after a short illness, on the 23d September, 1882.

---

[1] [In 1175 a Grof Dietrich of Witburg was known.—AM. ED.]

[2] [He was in England 1799 to 1801, and in the latter year went to Paris.—AM. ED.]

Wöhler's career as a chemist extends over two generations. Some sixty years ago, when the elementary nature of chlorine had just been established, and the isolation of cyanogen was still a novelty, young Wöhler already worked as an investigator, the same Wöhler who rejoiced with the chemists of to-day over the synthesis of indigo. Of the world of chemical discoveries that lie between he *magna pars fuit.* Within the limits of the present article, however, it is impossible to do more than indicate briefly the nature of some of his greater achievements. Amongst these his discovery of cyanic acid, and what it led him to, occupy a prominent place. From these investigations of his the science of organic chemistry may be said to date.

When, in 1828, Wöhler prepared the ammonia salt of his acid, he was astonished to find that the salt, although made by what appeared to be a straightforward double decomposition, did not exhibit the character of an ammonia salt at all, but turned out to be identical with urea, a substance which heretofore had been known only as one of the *organic* components of urine. Prior to this discovery a wide and impassable gulf had in the minds of chemists separated the mineral from the organic kingdom. Inorganic bodies all appeared to be derivable from their elements by a succession of acts of binary combination; the full analysis of such a body contained in itself the full instruction for its synthetical production in the laboratory. Organic substances, on the other hand, were supposed to be things of an entirely different order; in them the few elements which they all consist of were assumed to be united with one another, each with each, in a mysterious manner, which could be brought about only by the agency of "vital force." Vital force, it was now seen, had nothing to do with the formation of urea at any rate. The gulf was bridged over, and a great and new morning full of the highest promise dawned over chemistry. If the promise was more than fulfilled, if organic chemistry from a mere possibility developed into a reality, we owe this chiefly to the great researches which were carried out conjointly by Wöhler and Liebig.

One of the first, if not the first, of these was an investigation on the oxygenated acids of cyanogen, which they published in 1830. In their research they proved, both analytically and synthetically, that cyanic and cyanuric acid, although distinct bodies, have the same elementary composition, and that the former, when simply kept in a sealed-up tube, gradually passes wholly into a porcelain-like neutral solid, cyamelide, which is widely different from either. By these discoveries, and by Wöhler's synthesis of urea, the fact of isomerism was firmly established. Compared with this great conquest their joint work on mellitic acid (1830) and on sulphovinic acid (1831) appears small; it sinks into insignificance when viewed in the light of their immortal researches on bitter-almond oil and on uric acid.

In 1832 bitter-almond oil was supposed to be to bitter almonds what a hundred and one other essential oils are to their vegetable sources. Of its chemistry nothing was known except the fact that it contains loosely combined prussic acid, and that, when kept for a long time, it is liable to deposit a crystalline solid, as various other essential oils do. Liebig and Wöhler, being struck by the absence from even powdered bitter almonds of the intense smell characteristic of the oil, set about tracing the latter to its origin, and soon solved the question. In 1830 Robiquet and Boutron-Charlard had succeeded in extracting from bitter almonds a crystalline nitrogenous solid, soluble without decomposition in alcohol and in water, which they called amygdaline. What Liebig and Wöhler found was that, when bitter-almond meal is mashed up with water, this amygdaline, by the action of the water and a ferment (common to both sweet and bitter almonds), breaks up into sugar, prussic acid, and bitter-almond oil. They also succeeded in separating the prussic acid from the distilled oil, and found the thus purified oil to be a non-poisonous liquid of the composition C_7H_6O. This liquid, when exposed to the air, readily takes up oxygen and assumes the form of a solid, which is identical at the same time with the quasi-stearoptene of the oil and with Scheele's benzoic acid, $C_7H_6O_2$. When treated with chlorine, the purified oil yields a chloride, $C_7H_5O.Cl$,—the chlorine of which, by treatment with the respective potassium compounds, is displaced by its equivalent in bromine, iodine, sulphur, cyanogen, and, on treatment with ammonia, by the group NH_2. Water converts it into hydrochloric and benzoic acids. In all these reactions the group C_7H_5O holds together; it moves forwards and backwards as if it were a compound element,—a commonplace enough fact in the eyes of the chemical student of 1882, but a most wonderful revelation to the chemist of 1832. Berzelius, who certainly was not much given to dealing in superlatives, greeted the discovery in his *Jahresbericht* as opening up a new era in organic chemistry, and, rejecting the prosaic name of benzoyl which Wöhler and Liebig had given to their radical, proposed to name it proine, from πρωΐ, early in the day, or orthrine, from ὄρθρος, the dawn.

Equally important in a scientific sense, but greater as a piece of experimental work, was their joint research on Uric Acid (*q.v.*). After their uric acid research the ways of Wöhler and Liebig diverged. The latter continued to prosecute organic research; the former turned his attention more to inorganic subjects,—not exclusively, however, as the well-known research on narcotine (which was carried out in his laboratory, partly by himself partly by Blyth, and published in 1848) is alone sufficient to prove.

Amongst Wöhler's inorganic publications, a short notice on the improvements in the preparation of potassium is significant as forming the small beginning of a brilliant series of researches on the isolation of elementary substances and on their properties, a subject for which he evidently had a great love, as he always comes back to it in the intervals of other work. In 1827 he for the first time succeeded in isolating aluminium, the metal of clay, by means of a method which was soon found to be more generally applicable. Alumina, like many other metallic oxides, is not reducible by electrolysis or by the action of charcoal at any temperature. But, when heated with charcoal in chlorine gas, it passes into the state of a volatile chloride. What Wöhler found was that this chloride, when heated with potassium or sodium, readily gives up its chlorine and assumes the elementary form. The aluminium which Wöhler thus obtained was a gray powder; but in 1845 he succeeded in producing the metal in the shape of well-fused, fully metallic globules. Wöhler, on the second occasion, correctly ascertained all the properties which everybody now knows to be characteristic of this metal; and it is as well to add that where Wöhler's aluminium differed from what now occurs in commerce under this name it differed to its own advantage. That Wöhler should not have seen the practical importance of his discovery is not to be credited; if he never suggested an attempt to manufacture the metal industrially, that is only the natural consequence of the circumstances in which he was placed.

The earlier aluminium research was followed in 1828 by the isolation of beryllium and yttrium. These earlier metal reductions fall into the Berlin period. While in Cassel he worked out processes for the manufacture of nickel free from arsenic, and this laid the foundation for what is now a flourishing chemical industry in Germany. The several methods for the analysis of nickel and cobalt ores which he describes in his *Mineral-Analyse* appear to be an incidental outcome of this work. This subject was one of his favorite topics; as late as 1877 we see him coming back to it in the publication of a short process for the separation of nickel and cobalt from arsenic and iron.

In 1849 metallic titanium arrested his attention. Since the days of Wollaston those beautiful copper-like cubes which are occasionally met with in blown-out blast furnaces had been supposed to be metallic titanium pure and simple. Wöhler observed that the reputed metal, when fused with caustic alkali, emitted torrents of ammonia, and on further inquiry ascertained the crystals to be a ternary compound, containing the elements of a nitride and of a cyanide of the metal. In pursuance of this research Wöhler taught us how to prepare real titanium and really pure titanic acid.

In 1854 Deville's energetic attempts to produce aluminium industrially caused Wöhler to turn his attention again to this early and almost forgotten child of his genius. His first incentive, no doubt, was the natural and just desire to claim his right as the real discoverer of what Deville, in his ignorance of foreign scientific work, quite honestly though he had been the first to find out. This dispute came to a very satisfactory issue: Deville, after a little pardonable hesitation, fully acknowledged Wöhler's priority, and the two henceforth were friends, and worked together.

The first fruit of this happy union was a memorable joint research (published in 1856 and 1857), which led to their discovery of an adamantine and of a graphitoidal (in addition to the long-known amorphous) modification of boron. This graphitoidal species subsequently, in their own hands, proved to be a mistake; but the adamantine modification lives to this day as a true analogue of ordinary (carbon) diamond.

From boron to silicon is an easy transition, so we need not wonder at finding Wöhler, in 1857, engaged (conjointly with the physicist Buff) in a research on new compounds of silicon. On electrolyzing a solution of common salt with silicon containing aluminium as a positive electrode, they obtained a self-inflammable gas which they recognized as hydrogen contaminated with the previously unknown hydride of silicon, SiH_4, which body Wöhler subsequently, with the co-operation of Martius, obtained in a state of greater purity. Wöhler and Buff also obtained, though in an impure state, what were subsequently recognized by Friedel and Ladenburg as silicon-chloroform and as silicon-formic anhydride.

Space does not allow of more than a mere reference to Wöhler's researches on metallic or semi-metallic nitrides. What we know of this as yet little understood class of bodies, with barely an exception, came out of his laboratory, if it was not done by himself in the strict sense of the word. And only a reference can be made to the numerous processes which Wöhler, in the course of his long laboratory practice, has worked out for the preparation of pure chemicals, and for the execution of exact analytical separations. He had better work to do than to take up analytical problems for their own sake; but what he did in this direction incidentally amounts to a great deal. The analysis of meteorites was one of his favorite specialties,—one of his results being the discovery of organic matter in a meteorite which he examined in 1864.

As a teacher Wöhler ranks with Liebig and Berzelius. In a sense he was the greatest of the three. Berzelius never had the opportunity to teach large numbers of students in his laboratory; and Liebig lacked the many-sidedness so characteristic of the Göttingen laboratory as long as it really was under Wöhler's personal direction. One student might wish to work on organic chemistry, another on minerals, a third on metallurgy, a fourth on rare elements; let them all go to Wöhler, and all, as well as the fifth or sixth, would find themselves in the right place. That Wöhler in these circumstances was able to do much literary work is truly marvellous. His *Grundriss der Chemie*, which he published anonymously at first, has passed through many editions, and been translated into various foreign languages,—never, unfortunately, into English. A more valuable teaching book still, and more unique in its character, is his excellent *Practische Uebungen in der chemischen Analyse* (entitled in the second edition *Mineral-Analyse in Beispielen*), of which we have two English translations. To a man like him the compilation of either book probably gave little trouble; what must have taken up a very large portion of his valuable time are his translations of Berzelius's *Lehrbuch der Chemie*, and of all the successive volumes of Berzelius's *Jahresbericht*, which only thus became really available to the scientific world at large. From 1838, too, Wöhler was one of the editors of Liebig's *Annalen*.

Wöhler's last publication (1880) treats of a new kind of galvanic element in which the one metal aluminium serves for either pole.

A very excellent biography of Wöhler by Hofmann is published in the *Berichte der deutschen chemischen Gesellschaft* for 1882. (W. D.)

WOHLGEMUTH, **Michael** (1434–1519), an able painter of the school of Franconia, of which Nuremberg, where he was born in 1434, was the chief artistic centre. Little is known of his private life beyond the fact that in 1472 he married the widow of the painter Hans Pleydenwurff, whose son Wilhelm worked as an assistant to his stepfather. The importance of Wohlgemuth as an artist rests, not only on his own individual paintings, but also on the fact that he was the head of a large workshop, in which many different branches of the fine arts were carried on by a great number of pupil-assistants, including Albert Dürer (see vol. vii. pp., 478–83). In this *atelier* not only large altar-pieces and other sacred paintings were executed, but also elaborate retables in carved wood, consisting of crowded subjects in high relief, richly decorated with gold and color, such as pleased the rather doubtful Teutonic taste of that time (see p. 682 *infra*). Wood-engraving was also carried on in the same workshop, the blocks being cut from Wohlgemuth's designs, many of which are remarkable for their vigor and clever adaptation to the special necessities of the technique of woodcutting. Two large and copiously illustrated books have woodcuts supplied by Wohlgemuth and his stepson Wilhelm Pleydenwurff. The first is the *Schatzkammer der wahren Reichthümer des Heils*, printed by Koberger in 1491; the other is the *Historia Mundi*, by Schedel, 1493–94, a sort of encyclopædia, usually known as the *Nuremberg Chronicle*, which attained a very high degree of popularity at the time, and is now highly valued, not for the text, but for its remarkable collection of spirited engravings.

Among the paintings ascribed to Wohlgemuth a large number are clearly the work of less able assistants, but those by the hand of the master himself possess merit of a very high order, in their rich color, powerful drawing, and refined delicacy of finish. The earliest known work by Wohlgemuth is a retable consisting of four panels, dated 1465, now in the Munich gallery, a decorative work of much beauty. In 1479 he painted the retable of the high altar in the church of St. Mary at Zwickau, which still exists, receiving for it the large sum of 1400 gulden [$3558.53]. One of his finest and largest works is the great retable painted for the church of the Austin friars at Nuremberg, now moved into the museum; it consists of a great many panels, with figures of those saints whose worship was specially popular at Nuremberg. In 1501 Wohlgemuth was employed to decorate the town-hall at Goslar with a large series of paintings; some on the ceiling are on panel, and others on the walls are painted thinly in tempera on canvas. As a portrait-painter he enjoyed much repute, and some of his works of this class are very admirable for their realistic vigor and minute finish. Outside Germany Wohlgemuth's paintings are scarce; the Royal Institution at Liverpool possesses two good examples,—Pilate Washing his Hands, and the Deposition from the Cross, parts probably of a large altarpiece. During the last ten years of his life Wohlgemuth appears to have produced little by his own hand. One of his latest paintings is the retable at Schwabach, executed in 1508, the contract for which still exists. He died at Nuremberg in 1519.

WOLCOT, **John** (1738–1819), painter and satirist under the pseudonym of Peter Pindar, was son of Alexander Wolcot, surgeon at Dodbrooke, adjoining Kingsbridge, in Devonshire, and was baptized there 9th May, 1738. He was educated at Kingsbridge free school under John Morris, at the Bodmin grammar school, and in France, and as the result of this training was well acquainted with Greek and Latin, and spoke French with facility. For seven years he was apprenticed to his uncle, John Wolcot, a surgeon at Fowey, and it was intended that he should in due course succeed to the practice. Among his uncle's patients were Sir William Trelawny and his household, at Trelawne, near Fowey, and when Trelawny went to Jamaica as governor in 1769 he was accompanied by Wolcot, who had now qualified as M.D. of the university of Aberdeen (8th September, 1767). Considerable ecclesiastical patronage was in the gift of the governor of Jamaica, and, to render himself eligible for any desirable living which might fall vacant, Wolcot returned to England, and was ordained deacon on 24th June, 1769, and priest on the following day. With these qualifications he once more repaired to the West Indies, and in 1772 became incumbent of Vere, Jamaica, but on the death of his patron (11th December, 1772) he bade adieu to the colony, and on his arrival in England settled as a physician at Truro. Party politics ran high in that borough, and Wolcot threw himself into the fray, making an especial butt of an influential merchant, afterwards the representative of Truro in parliament. In consequence of those indiscretions he left in 1779, and in 1781 he fixed his permanent abode in London. He brought with him the young Cornish artist, John Opie, whose talents in painting received the enthusiastic admiration of the doctor. Wolcot exerted himself energetically in spreading the fame of his young protegé by puffs in the papers and by introductions to the leaders of fashion.[1] From this date he dropped the profession of medicine, as he had previously thrown off his clerical orders, and earned the means of subsistence by his satirical productions. Wolcot had long dabbled in poetry. His first effusion, on the recovery of the elder Pitt from gout, is said to have appeared in *Martin's Magazine*, about 1756, when he was resident at Fowey, and he dictated verses until within a few days of his death. Many of his serious pieces were marked by taste and feeling, and his translation of Thomas Warton's Latin epigram on sleep dwells in the memory through its happy simplicity. After his settlement in London he threw off with marvellous rapidity a succession of pungent satires. George III. was his favorite subject of ridicule, and his peculiarities were described or distorted in *The Lousiad*, *Peeps at St. James's*, *The Royal Visit to Exeter*. Two of Wolcot's happiest satires on the "farmer king" depicted the royal survey of Whitbread's brewery and the king's wonder how the apples got into the apple dumplings. The most entertaining biography which the English language has yet produced was ridiculed in *An Epistle to James Boswell*, and in a piece on the rival biographers, happily called *Bozzy and Piozzi*. The leading man of science and the adventurous traveller fell under his lash,—the former in *Sir Joseph Banks and the Emperor of Morocco*, and the latter in a *Complimentary Epistle to James Bruce*. When Wolcot came to London with his rough artistic genius from the west his hand was directed against the painters of the day who had already established their reputation, and his *Lyric Odes to the Academicians* often turned their modes of painting into a jest with marvellous effect. Wolcot was himself no mean artist, and in 1797 there was published *Six Picturesque Views from Paintings by Peter Pindar, engraved by Alken*. His knowledge of the art of painting lent force to his strictures on the academicians of the age. In 1795 he disposed of his works to the booksellers for an annuity of £250 [$1237.50] a year, which he lived to enjoy for many more years than the purchasers expected or desired. His various pieces were published in 1796 in four octavo volumes, and they were often reprinted. His satires are said to have exercised such an effect on public opinion that the ministers pressed upon him a Government pension, on condition that he refrained from any further attacks on the king's peculiarities; but it is also asserted that he speedily declined to accept it any longer, and that he even returned the moneys which he had received. Like many another ridiculer of the idiosyncrasies of others he was himself very susceptible to criticism, and for some attacks made on him by Gifford, the editor of the *Quarterly Review*, he attempted to belabor his satirical opponent in Wright's shop in Piccadilly, but Gifford was too quick for him, and Wolcot was soundly thrashed. He died at Latham Place, Somer's Town, London, on 14th January, 1819, and seven days later was buried near Samuel Butler, the author of *Hudibras*, in the vestry vault in the church yard of St. Paul's, Covent Garden.

---

[1] See *Opie and his Works*, by J. Jope Rogers.

Polwhele, the Cornish historian, was well acquainted with Wolcot in his early life, and the best account of his residence in the west is found in vol. i. of Polwhele's *Traditions* and in Polwhele's *Biographical Sketches*, vol. ii. Cyrus Redding was a frequent visitor at the old man's house, and has described Wolcot's later days in his *Past Celebrities*, vol. i., and his *Fifty Years' Recollections*, vols. i. and ii. John Taylor, "everybody's Taylor," lived "on the most friendly footing with the doctor," who figures in the *Records of my Life*. Wolcot's humor was broad, and he cared little whether he hit above or below the belt, but he had a keen eye for the ridiculous, and was endowed with a wondrous facility of diction.

WOLF. The zoological position and general characters of the wolf (*Canis lupus*) are described in the article MAMMALIA (vol. xv. pp. 444–5), where the difficulties that naturalists meet with in separating and defining the numerous variations of the animals called wolves, dogs, jackals, and foxes are shown. The true wolves are (excluding some varieties of the domestic dog) the largest members of the genus, and have a wide geographical range, extending over nearly the whole of Europe and Asia, and North America from Greenland to Mexico, but they are not found in South America or Africa, being replaced in both of these continents by various species of jackals and foxes. As might be expected from this extensive range, and the varied character of the climatic conditions of the countries they inhabit, they present great diversities of size, length and thickness of fur, and coloration, although resembling each other in all important structural characters. These differences have given rise to a supposed multiplicity of species, expressed by the names of *C. lupus*, *C. lycaon*, (Central Europe), *C. laniger* and *C. niger* (Tibet), *C. pallipes* (India), *C. occidentalis*, *C. nubilis*, *C. mexicanus*, etc., of North America, but it is very doubtful whether these ought to be distinguished as other than local varieties. In North America there is a second distinct smaller species, called the coyote or prairie wolf (*Canis latrans*), and perhaps the Japanese wolf (*C. hodophylax*) may also be distinct, although, except for its smaller size and shorter legs, it is scarcely distinguishable from the common species. Though generally distributed throughout the Indian peninsula, the wolf is not found in Ceylon nor in Burmah and Siam. The ordinary color of the wolf is a yellowish or fulvous gray, but specimens have been met with almost pure white and others entirely black. In northern countries the fur is longer and thicker, and the animal generally larger and more powerful than in the southern portion of its range. Its habits are similar everywhere, and it is still, and has been from time immemorial, especially known to man in all the countries it inhabits as the devastator of his flocks of sheep. Wolves do not catch their prey by lying in ambush, or stealing up close to it, and making a sudden spring as the cat tribe do, but by fairly running it down in open chase, which their speed and remarkable endurance enable them to do, and usually, except during summer, when the young families of cubs are being separately provided for by their parents, they assemble in troops or packs, and by their combined and persevering efforts are able to overpower and kill even such great animals as the American bison. It is singular that such closely allied species as the domestic dog and the Arctic fox are among the favorite prey of wolves, and, as is well known, children and even full-grown people are not unfrequently the objects of their attack when pressed by hunger. Notwithstanding the proverbial ferocity of the wolf in a wild state, many instances are recorded of animals taken when quite young becoming perfectly tame and attached to the person who has brought them up, when they exhibit many of the ways of a dog. They can, however, rarely be trusted by strangers.

The history of the wolf in the British Isles, and its gradual extirpation, has been thoroughly investigated by Harting in his work on *Extinct British Animals*, from which the following account is abridged. To judge by the osteological remains which the researches of geologists have brought to light, there was perhaps scarcely a county in England or Wales in which, at one time or another, wolves did not abound, while in Scotland and Ireland they must have been still more numerous. The fossil remains which have been discovered in Britain are not larger than, nor in any way to be distinguished from, those of European wolves of the present day. Wolf-hunting was a favorite pursuit of the ancient Britons as well as of the Anglo-Saxons. In Athelstan's reign these animals abounded to such an extent in Yorkshire that a retreat was built by one Acehorn, at Flixton, near Filey, wherein travellers might seek refuge if attacked by them. As is well known, great efforts were made by King Edgar to reduce the number of wolves in the country, but, notwithstanding the annual tribute of 300 skins paid to him during several years by the king of Wales, he was not altogether so successful as has been commonly imagined. In the reign of Henry III. wolves were sufficiently numerous in some parts of the country to induce the king to make grants of land to various individuals upon the express condition of their taking measures to destroy these animals wherever they could be found. In Edward II.'s time, the king's forest of the Peak, in Derbyshire, is especially mentioned as infested with wolves, and it was not until the reign of Henry VII. (1485–1509) that wolves appear to have become finally extinct in England. This, however, is rather a matter of inference from the cessation of all mention of them in local records than from any definite evidence of their extirpation. Their last retreat was probably in the desolate wolds of Yorkshire. In Scotland, as might be supposed from the nature of the country, the wolf maintained its hold for a much longer period. There is a well-known story of the last of the race being killed by Sir Ewen Cameron of Lochiel in 1680, but there is evidence of wolves having survived in Sutherlandshire and other parts into the following century (perhaps as late as 1743), though the date of their final extinction cannot be accurately fixed. In Ireland, in Cromwell's time, wolves were particularly troublesome, and said to be increasing in numbers, so that special measures were taken for their destruction, such as the offering of large rewards for their heads, and the prohibition (in 1652) of the exportation of "wolf-dogs," the large dogs used for hunting the wolves. The active measures taken then and later reduced their numbers greatly, so that towards the end of the century they became scarce, but, as in the case of the sister island, the date of their final disappearance cannot now be ascertained. It has been placed, upon the evidence of somewhat doubtful traditions, as late as 1766.

It is entirely owing to their insular position that the British Islands have been able to clear themselves of these formidable and destructive animals, for the neighboring country of France, with no natural barriers to prevent their incursions from the vast continent to the east, is still liable every winter to visits from numbers of them, as the following figures indicate. Government rewards were paid in 1883 for 1316 wolves destroyed, in 1884 for 1035, in 1885 for 900, and in 1886 for 760. The increase of the reward just before the first-named date seems thus to have had some effect in lessening the number. (W. H. F.)

WOLF, Friedrich August (1759–1824), was born in 1759 at Hainrode, a little village not far from Nordhausen, in the province of Hanover. His father, who was village schoolmaster and organist, was in his way an enthusiast in education, and gave his son whatever advantage is to be gained by the earliest possible cultivation. In time the family removed to Nordhausen, and there young Wolf went to the grammar school, where he soon acquired all the Latin and Greek that the masters could teach him, besides learning French, Italian, Spanish, and music. This, however, was in the earlier and (as he himself regarded it) the idler part of his schooltime. He presently took his education into his own hands, devoted himself entirely to classics, borrowed books wherever he could, and rapidly stored his young and powerful memory with their contents. The precocity of his attainments was only equalled by the force of will and confidence in his own powers which characterized him throughout life.

After two years of solitary study, at the age of eighteen, Wolf went to the university of Göttingen. His first act there was a prophecy—one of those prophecies which spring from the conscious power to bring about their fulfilment. He had to choose his "faculty," and chose one which then existed only in his own mind, the faculty of "philology." What is even more remarkable, the omen was accepted. He carried his point, and was enrolled as he desired.

Wolf's relations with Heyne, who was then the chief ornament of Göttingen, form an unpleasant chapter, which may well be passed over here. Heyne was a scholar, of little force or originality, but he was one of those who, by their power of assimilating and transmitting the thoughts of others, often rise to the highest reputation. Wolf soon left him, and fell back upon the university library from which he borrowed with his old avidity.

During the years 1779–83 Wolf was a schoolmaster, first at Ilfeld, then at Osterode. His success as a teacher was striking, and he found time to publish an edition of the *Symposium*, which excited notice, and led to his promotion to a chair in the Prussian university of Halle.

The moment was a critical one in the history of education. The literary impulse of the Renaissance was almost spent; scholarship had become dry and trivial. A new school, that of Locke and Rousseau, sought to make teaching more modern and more human, but at the sacrifice of mental discipline and scientific aim. Wolf was eager to throw himself into the contest on the side of antiquity. In Halle (1783–1807) by the force of his will and the enlightened aid of the ministers of Frederick the Great, he was able to carry out his long-cherished ideas, and found the science of philology. By one of England's insular aberrations, the word "philology" threatens to be confined to the study of the forms of language. Wolf defined it to be "knowledge of human nature as exhibited in antiquity." The matter of such a science, he held, must be sought in the history and education of some highly cultivated nation, to be studied in written remains, works of art, and whatever else bears the stamp of national thought or skill. It has therefore to do with both history and language, but primarily as a science of *interpretation*, in which historical facts and linguistic facts take their place in an organic whole. Such was the ideal which Wolf had in his mind when he established the philological *seminarium* at Halle.

Wolf's writings make little show in a library, and were always subordinate to his teaching. During his time at Halle he published his commentary on the *Leptines* (1789)—which suggested to his pupil, Aug. Boeckh, the *Public Economy of Athens*—and a little later the *Prolegomena* to Homer (1795). This book, the work with which his name is chiefly associated, was thrown off in comparative haste to meet an immediate need. It has all the merits of a great piece of oral teaching—command of method, suggestiveness, breadth of view. The reader does not feel that he has to do with a theory, but with great ideas, which are left to bear fruit in his mind (see HOMER).

The Halle professorship ended tragically, and with it the happy and productive period of Wolf's life. He was swept away, and his university with him, by the deluge of the French invasion. A painful gloom oppressed his remaining years (1807–24), which he spent at Berlin. He became so fractious and intolerant as to alienate some of his warmest friends. He gained a place in the department of education, through the exertions of W. von Humboldt. When this became unendurable, he once more took a professorship. But he no longer taught with his old success; and he wrote very little. His most finished work, the *Darstellung der Alterthumswissenschaft*, though published at Berlin (1807), belongs essentially to the Halle time. At length his health gave way. He was advised to try the south of France. He got as far as Marseilles, and was laid in the classic soil of that ancient Hellenic city.

The chief source of this sketch has been the admirable article by Mr. Mark Pattison in the *North British Review* of June, 1865, soon (we believe) to be reprinted by the Clarendon Press. Since the date of that article Wolf's *Kleine Schriften* have been edited by G. Bernhardy (Halle, 1869). The works not included in that collection are the *Prolegomena*, the *Letters to Heyne* (Berlin, 1797), the commentary on the *Leptines* (Halle, 1789), and a translation of the *Clouds* of Aristophanes (Berlin, 1811). To these must be added the *Vorlesungen* on *Iliad* i.–iv., taken from the notes of a pupil, and edited by Usteri (Bern, 1830). (D. B. M.)

WOLFE, Charles (1791–1823), author of *The Burial of Sir John Moore*, born in Dublin in 1791, was an Irish clergyman, curate of Ballyclog, in Tyrone, and afterwards of Donoughmore. The poem seems to have been written when Wolfe was still a student in Trinity College, Dublin, and it originally appeared in an Irish newspaper (the *Newry Telegraph*) in 1817. The initials C. W. were affixed to it at first, but as it was quoted from newspaper to newspaper these were dropped, and, eventually finding its way into the *Edinburgh Annual Register*, it was claimed for and by as many people as *Punch's* famous advice to those about to marry. Wolfe's Trinity College friends came to the rescue, and one of them (Archdeacon Russell) wrote a memoir which, in spite of its being one of the dullest memoirs ever written, went through at least eight editions—a curious testimony to the popularity of the poem. Wolfe died of consumption at Cork in 1823, at the early age of thirty-two.

WOLFE, James (1727–1759), the hero of Quebec, was the son of Lieutenant-General Edward Wolfe, and was born in the vicarage of Westerham, Kent, on January 2, 1727. At an early age he evinced a keen interest in the adventures and achievements of war, and at thirteen accompanied his father to Cartagena. Obtaining a commission as ensign in the 12th regiment of foot in 1741, he embarked for Flanders on the 10th May of the following year, and during the campaign of 1743, in which he acted as adjutant, he was present at the battle of Dettingen. Having exhibited, in addition to high courage, a rare talent for command, he received while yet a youth a commission, on 3d June, 1744, as captain in the 4th or king's regiment of foot, and shortly afterwards was made brigade-major. In this capacity he took part in the suppression of the rebellion of 1745, being present both at Falkirk and at Culloden. In January, 1747, he sailed for the Continent, and for his valor at the battle of Lawfeldt on the 2d July he received the public thanks of the commander-in-chief, the duke of Cumberland. On 5th January, 1749, he was gazetted major of the 20th regiment, and in the following year he became lieutenant-colonel. In this position he began to manifest those great qualities as a commander which were the secret of his success, and, while introducing into the regiment that perfect discipline necessary to the highest proficiency, secured the personal affection of almost every soldier. In the luckless Rochefort expedition he was quartermaster-general, and by his dashing gallantry attracted the special notice of Pitt. When therefore it was decided in 1758 to send an expedition to Cape Breton under Amherst, Wolfe was appointed by Pitt brigadier-general. Under the eye of Amherst and Admiral Boscawen he conducted the landing at Louisburg through a heavy surf and in face of the well-directed fire of the enemy. He himself was the first to land, and forming his division into compact order attacked and carried with the bayonet the nearest French battery, after which he formed the camp. Chiefly through his ardent energy the siege operations were brought to a successful issue after an investment of six months. Wolfe then eagerly urged an attack on Quebec, expressing his determination to leave the service if nothing further was to be done. Pitt not only acted on his advice, but selected him as the leader of the difficult and almost chimerical enterprise. Quebec, besides being strongly fortified, was occupied by forces which greatly outnumbered those placed at Wolfe's disposal. Moreover, Montcalm the French commander had an open country behind him for supplies, and was only called upon to protract the defence behind his ramparts till the resources of the besiegers were exhausted. It was incumbent on Wolfe to force Montcalm to give battle, and this could only be effected by manœuvres of the most daring kind. After bombarding the city from the heights of Point Levi, Wolfe made an attempt, 29th June, 1759, to attack Montcalm's camp in front, but his instructions were not carried out with sufficient accuracy, and foreseeing that irretrievable disaster was imminent he found it necessary after the attack had begun to recall his troops and retire. As the enemy were now on their guard against a second attack of a similar kind, Wolfe saw that the problem must be solved by some other method, and after some time spent in careful consideration he hit upon a still more daring plan. In the evening of the 12th September with 5000 men he silently descended the St. Lawrence in boats, and, scaling the heights of Abraham in the darkness, drew up his forces on the plains so as to cut off Montcalm's supplies. The audacity of the movement was too much for Montcalm's patience. On his attention being called to it he exclaimed "Oui, je les vois où ils ne doivent pas être ; je vais les écraser." But the genius of Wolfe was equal to the occasion. With calm self-possession he forbade a single shot to be fired till the enemy were within thirty yards. The crushing volleys with which they were then met, followed by an impetuous attack with the bayonet, was decisive of the action. While leading a charge at the head of the Louisburg grenadiers, Wolfe had one of his wrists shattered by a shot, but wrapping a handkerchief round it he kept on. Another shot struck him, and he still advanced, when a third lodged in his breast. While he was lying in a swoon some one near him exclaimed, "They run ; see how they run!" "Who run?" demanded Wolfe, like one roused from sleep. "The enemy," was the answer; "they give way everywhere." Wolfe then signified that a regiment should be sent down to Charles river to cut off their retreat, and on learning that his orders had been obeyed he turned on his side, and murmured as his last words, "Now, God be praised, I will die in peace." Montcalm, the French commander, was mortally wounded in the same action, and died soon afterwards. By the surrender of Quebec, Canada was lost to the French.

See Wright, *Life of Major-General James Wolfe* (1864), and Parkman, *Montcalm and Wolfe* (2 vols., 1884).

WOLFENBÜTTEL a small town in the duchy of Brunswick, is situated on both banks of the Oker, 7 miles to the south of Brunswick. It contains various minor tribunals, some schools, and a small garrison; and it carries on a few unimportant manufactures (machinery, copper goods, linen, cork, preserves, etc.). Wolfenbüttel, in fact, may be accepted as tolerably representative of the average dull German provincial town, clinging more or less faithfully to the traditions of the period when it was the residence of the ducal family. It owes its chief interest to its connection with Lessing, who was ducal librarian there from 1770 till his death in 1781. The old library building, designed in 1723 in imitation of the Pantheon at Rome, contains a marble statue of the poet. The library, including 300,000 printed books and 7000 MSS., has, however, been transferred to a large new Renaissance edifice, opened in October, 1887. It is especially rich in copies of the Bible and in books of the early Reformation period. Opposite the old library is the palace, occupied since 1835 by a theatre, a law court, and a seminary. The ducal burial-vault is in the church of St. Mary. There are two other Evangelical churches and a Roman Catholic church in Wolfenbüttel, and perhaps the only other noteworthy building is the large prison. The ancient fortifications have been converted into promenades, once a favorite resort of Lessing. In 1885 the population of Wolfenbüttel, including the suburbs of Auguststadt and Juliusstadt, was 13,455. The "Wolfenbüttel Fragments" are alluded to under Lessing, vol. xiv. p. 481; see also Reimarus.

A castle is said to have been founded on the site of Wolfenbüttel by a margrave of Meissen about 1046. When this began in 1267 to be the residence of the early Brunswick or Wolfenbüttel line of counts, a town gradually grew up around it. In 1542 it was taken by the Saxons and Hessians, who however evacuated it five years later after the battle of Mühlberg. In the Thirty Years' War, in June, 1641, the Swedish, under Wrangel and Königsmark, defeated the Austrians under the archduke Leopold at Wolfenbüttel. The town passed wholly into the possession of the Brunswick-Wolfenbüttel family in 1671, and for nearly one hundred years enjoyed the distinction of being the ducal capital. In 1754, however, Duke Charles transferred the ducal residence to Brunswick, a blow from which Wolfenbüttel has never recovered.

WOLFF, Caspar Friedrich (1733–1794), who is justly reckoned the founder of modern embryology, was born at Berlin in 1733, and studied anatomy and physiology under Meckel, and later at Halle, where he graduated in medicine in 1759, his thesis being his famous *Theoria Generationis*. After serving as a surgeon in the Seven Years' War, he wished to lecture on anatomy and physiology in Berlin; but being refused permission he accepted a call from the empress Catherine to become professor of those subjects at the academy of St. Petersburg, and acted in this capacity until his death in 1794.

While the theory of "evolution" in the crude sense of a simple growth in size and unfolding of organs all previously existent in the germ was in possession of the field, his researches on the development of the alimentary canal in the chick first clearly established the converse view, that of *epigenesis, i.e.*, of progressive formation and differentiation of organs from a germ primitively homogeneous (see EMBRYOLOGY, vol. viii. p. 151–2). He also largely anticipated the modern conception of embryonic layers, and is said even to have foreshadowed the cell theory. It is certain that he discerned, long before Goethe, the leafy homology of the parts of flowers.

WOLFF, CHRISTIAN (1679–1754), is an important figure in the history of philosophy, and his life has more dramatic interest than is usually the case with an academic teacher. He was the son of a tanner, and was born at Breslau on the 24th January, 1679. His father had dedicated him before his birth to a life of learning, having been disappointed himself in similar aspirations, and Wolff accordingly received a gymnasium training in Breslau, whence he proceeded in 1699 to the university of Jena. Mathematics and physics formed at first his chief attraction, to which he soon added philosophy. He studied the Cartesian philosophy as well as the works of Grotius and Pufendorf, but was chiefly influenced by Tschirnhausen's *Medicina Mentis*. In 1703 he qualified as privat-docent in the university of Leipsic, where he lectured till 1707, when he was called as professor of mathematics to Halle. Before this time he had made the acquaintance of Leibnitz, of whose philosophy his own system is a modification. In Halle Wolff limited himself at first to mathematics, but on the departure of a colleague he annexed physics, and presently included in his lectures all the main philosophical disciplines. He followed the example of Thomasius in lecturing in German instead of Latin. This fact, and the remarkable clearness of his exposition, caused his class-rooms to be crowded. He also became known as a writer to a wider circle, and was made member of the Royal Society of London and the Academy of Berlin. But the claims which Wolff advanced on behalf of the philosophic reason appeared impious to his theological colleagues. Halle was the headquarters of Pietism, which, after a long struggle against the rigidity of the older Lutheran dogmatism, had itself assumed the characteristics of a new orthodoxy. This orthodoxy, represented by Joachim Lange and A. H. Francke, considered the cause of supernaturalism endangered by a philosophy which professed by the unassisted reason to present the whole universe as a rational and necessarily determined system. Wolff's professed ideal was to base theological truths on evidence of mathematical certitude. Personal grounds accentuated the bitterness. Strife broke out openly in 1721, when Wolff, on the occasion of laying down the office of pro-rector, delivered an oration "On the Moral Philosophy of the Chinese," in which he praised the purity of the moral precepts of Confucius, pointing to them as an evidence of the power of human reason to attain by its own efforts to moral truth. The attacks and accusations in connection with this address were unsuccessful at the time, but Wolff continued to give offence to his colleagues, and to Lange in particular, by his action in the filling up of university chairs, and in 1723 a disappointed pupil, a docent in the same university, published a hostile criticism upon Wolff's system, at the instigation, it is said, of Lange. This was contrary to university etiquette and statute, and Wolff somewhat injudiciously appealed to the Government for an interdict upon such attacks. He succeeded in obtaining this, but his enemies retaliated by sending to court a united representation of the dangerous character of his views. Through a worthless courtier, they gained the ear of the king, Frederick William I., by a concrete example, which touched him most nearly. If one of His Majesty's famous grenadiers at Potsdam should desert, the king would have no right, it was represented, upon the principles of Wolff, to punish the man, seeing that he only did what it was necessarily predetermined that he should do. The result of this representation was swifter and more drastic than Wolff's bitterest enemies had calculated on. On the 13th November, 1723, a cabinet order arrived in Halle deposing Wolff from his office, and commanding him to leave Halle and quit Prussian territory within forty-eight hours on pain of a halter. The same day Wolff passed into Saxony, and presently proceeded to Marburg, to which university he had received a call before this crisis. The landgrave of Hesse received him with every mark of distinction, and the circumstances of his expulsion drew universal attention to his philosophy. It was everywhere discussed, and over two hundred books and pamphlets appeared for or against it before 1737, not reckoning the systematic treatises of Wolff and his followers. The seventeen years which Wolff spent at Marburg witnessed the publication of his chief works, and the rise of his philosophy to almost undisputed sway throughout Germany. His earlier treatises were, like his lectures, composed in German: a treatise on logic, called *Vernünftige Gedanken von den Kraften des menschlichen Verstandes* (1712); a metaphysic, *Vernünftige Gedanken von Gott, der Welt, und der Seele des Menschen, auch aller Dinge überhaupt* (1719); treatises on ethics and politics with similar titles (1721); three on the philosophy of nature (1723–4–5), followed by an encyclopædic review of his system in 1726. From that time he began to go over the same ground more fully and methodically in a series of Latin works. The logic, ontology, cosmology, and empirical psychology appeared between 1728 and 1732, followed by the rational psychology and natural theology in 1734. Meanwhile, after some years the king of Prussia made overtures to Wolff to return, and in 1739, by the irony of events, a cabinet order prescribed the study of the Wolffian philosophy to all candidates for ecclesiastical preferment. In 1740 Frederick William died suddenly, and one of the first acts of his successor, Frederick the Great, was to recall Wolff to Halle on the most flattering and advantageous terms. His entry into Halle on the 6th of December, 1740, partook of the nature of a triumphal procession. In 1743 he became chancellor of the university, and in 1745 he received the title of "freiherr" from the elector of Bavaria. But, though he was thus loaded with honors, and his philosophy everywhere triumphant, he found that he had outlived his power of attracting the academic youth. His matter was no longer fresh nor were his own powers what they had been when he left Halle seventeen years before, and he had the bitter experience of lecturing to empty class-rooms. He died on the 9th April, 1754, in the seventy-sixth year of his age, fourteen years after his return to Halle.

The Wolffian philosophy held almost undisputed sway in Germany till it was displaced by the Kantian revolution. It is essentially a common-sense adaptation or watering-down of the Leibnitian system; or, as we can hardly speak of a system in connection with Leibnitz, Wolff may be said to have methodized and reduced to dogmatic form the thoughts of his great predecessor, which often, however, lose the greater part of their suggestiveness in the process. Since his philosophy disappeared before the influx of new ideas and the appearance of more speculative minds, it has been customary to dwell almost exclusively on its defects—the want of depth or freshness of insight, and the aridity of its neo-scholastic formalism, which tends to relapse into verbose platitudes. But this is to do injustice to Wolff's real merits. These are mainly his comprehensive view of philosophy, as embracing in its survey the whole field of human knowledge, his insistence everywhere on clear and methodic exposition, and his confidence in the power of reason to reduce all subjects to this form. To these must be added that he was practically the first to "teach philosophy to speak German." It will be seen that these merits concern the form rather than the matter of philosophy, the latter being mainly derived from Leibnitz, with some modifications in the sense of the older scholastic Aristotelianism. The Wolffian system retains the determinism and optimism of Leibnitz, but the monadology recedes into the background, the monads falling asunder into souls or conscious beings on the one hand and mere atoms on the other. The doctrine of the pre-established harmony also loses its metaphysical significance, and the principle of sufficient reason introduced by Leibnitz is once more discarded in favor of the principle of contradiction which Wolff seeks to make the fundamental principle of philosophy. Philosophy is defined by him as the science of the possible, and divided, according to the two faculties of the human individual, into a theoretical and a practical part. Logic, sometimes called *philosophia rationalis*, forms the introduction or propædeutic to both. Theoretical philosophy has for its parts ontology or *philosophia prima*, cosmology, rational psychology, and natural theology; ontology treats of the existent in general, psychology of the soul as a simple non-extended substance, cosmology of the world as a whole, and rational theology of the existence and attributes of God. These are best known to philosophical students by Kant's treatment of them in the *Critique of Pure Reason*. Practical philosophy is subdivided into ethics, economics, and politics. Wolff's moral principle is the realization of human perfection. (A. SE.)

WOLF-FISH. See SEA-WOLF.

WOLFRAM VON ESCHENBACH, a mediæval German poet, lived in the latter part of the 12th and the early part of the 13th century. Little is known about the facts of his life, and such knowledge as we possess is derived wholly from his own writings. He belonged to a poor but noble family. He speaks of himself as a Bavarian, and refers to the count of Wertheim as his feudal lord. His home was the castle of Eschenbach (near Ansbach), and in the churchyard at Eschenbach what was said to be his grave was shown as late as the beginning of the 17th century. He spent some time at the court of Hermann, landgrave of Thuringia, where he met Walther von der Vogelweide, to whom he makes two references in his works. Wolfram survived Hermann, who died in 1216. His residence at the Thuringian court led to his being included among the poets who were afterwards said to have taken part in a great competition for poetic supremacy at the Wartburg. Wolfram seems to have been happily married, and to have had children. In politics he was a supporter of the emperor Otho IV. He understood French, but could neither read nor write.

His greatest work is *Parzival*, an epic poem completed between 1205 and 1215. It combines the story of the Holy Grail with incidents from the legends of southern France about the old princes of Anjou and from the legendary history of Arthur and the Knights of the Round Table. To Wolfram's contemporary, Gottfried of Strasburg, the style of this poem seemed abstract and obscure; and *Parzival* certainly lacks the lightness and grace of Gottfried's masterpiece, *Tristan*. It has, however, high imaginative qualities, and regarded as a whole, is the most splendid achievement in the literature of Germany during the period of Middle High German. Even in Wolfram's day the poem produced a profound impression, and in the 15th century it was still so warmly appreciated that it was one of the earliest works made accessible to the public through the invention of printing. The principal authority used by Wolfram seems to have been the *Conte del Gral* of Chrestien de Troyes. He mentions, besides this work, a poem by Kiot, a Provençal poet, but nothing is known of Kiot, and it may be that he never really existed. Whatever may have been the sources of *Parzival*, Wolfram gave to everything he borrowed from others a wholly new character, impressing upon it strongly the mark of his own great ideal spirit. Besides his chief work and various lyrics he composed two epic fragments, *Titurel* and *Willehalm*, the former before *Parzival*, the latter after. *Titurel*, a love-tale, belongs to the same cycle of legends as the story of *Parzival*, and, so far as form is concerned, it is the brightest and most artistic of Wolfram's works. *Willehalm* presents the legendary history of St. William of Orange, a contemporary of Charlemagne. The so-called third part of this poem was continued by Ulrich von Türheim about 1250, the first part by Ulrich von dem Türlin between 1252 and 1278.

A complete edition of Wolfram's works was issued by Lachmann in 1833. Bartsch afterwards published, with notes, an edition of *Parzival* and *Titurel*. There are renderings into modern German by San-Marte and Simrock. See San-Marte's *Parzival-Studien*, and essays by Bartsch, Pfeiffer, Rochat, and Zingerle in Pfeiffer's *Germania*.

WOLLASTON, WILLIAM (1659-1724), English philosophical writer, was born at Coton-Clanford in Staffordshire, March, 1659. He was educated under disadvantages both at school and at the university, but left his college (Sidney, Cambridge) with a high reputation for his acquirements, in September, 1681. He then became assistant-master of the Birmingham grammar school, and in that position took holy orders. In 1688 an uncle unexpectedly left him an ample fortune, on which he retired, moving to London, where he married a lady of fortune, and devoted himself to his domestic duties and the pursuit of learning and philosophy. In his studies he occupied himself more especially with the foundation of the common doctrines of "natural religion," which were in those years so universally discussed. The substance of his thinking on these doctrines he embodied, towards the end of his life, in the one book by which he is now remembered, *The Religion of Nature Delineated*, the first edition of which was privately printed in 1722, and the second, revised, in 1724. He died in October of the same year.

Wollaston's *Religion of Nature*, which falls between Clarke's *Discourse of the Unchangeable Obligations of Natural Religion* and Butler's *Sermons*, was one of the popular philosophical books of its day. More than 10,000 copies of it were sold in a few years. It was highly valued by Bishop Butler and a favorite book of Queen Caroline, the wife of George II., and she ordered the numerous quotations from Latin, Greek, and Hebrew in the notes to be translated into English for her use. To the 8th edition (1750) was added a life of the author. Though the book is now remembered chiefly for the theory of the nature of moral good and evil advocated in it, it was rather its defence of natural religion, and its bold, sometimes original, penetrating, and often eloquent discussion of great ethical religious problems which secured for it "deserved reputation." It was designed to be an answer to the two questions—Is there such a thing as natural religion? and, If there is, what is it? Wollaston starts with the assumption that religion and morality are identical, and labors to show that religion is "the pursuit of happiness by the practice of *truth* and reason." The moral theory on which he values himself as propounding a view met with nowhere else is that moral evil is the practical denial of a true proposition, and moral good the affirmation of it. To steal is wrong because it is to deny that the thing stolen is what it is—the property of another. In Wollaston's view "happiness" occupies a large place. He makes pain an evil and pleasure a good. Happiness is a duty and an end to be aimed at by every intelligent being. He makes the production of happiness also the test of the rightness or wrongness of all social regulations. But he admits that in this world happiness and virtue only *tend* to coincide, and derives from their defective coincidence his argument for a state of future rewards and punishments.

In addition to this work Wollaston published anonymously a small book *On the Design of the Book of Ecclesiastes, or the Unreasonableness of Men's Restless Contention for the Present Enjoyments, represented in an English Poem*, London, 1691. The subject of the book is sufficiently indicated in its title, and was in form and argument so worthless that its author consulted his reputation by immediately suppressing it. It is now very scarce. The university library of Cambridge possesses a copy.

See Wollaston's life prefixed to the 8th ed. of his *Religion of Nature*; John Clarke, *Examination of the notion of Moral Good and Evil advanced in a late book entitled The Religion of Nature Delineated*, London. 1725; Dreschler, *Ueber Wollaston's Moral-Philosophie*, Erlangen, 1802; Leslie Stephen's *History of English Thought in the Eighteenth Century*, London, 1876, ch. iii. and ch. ix.; H. Sidgwick's *History of Ethics*, 1886, p. 194 *sq*. A French translation of his book, *Ebauche de la Religion Naturelle*, appeared at The Hague in 1726.

WOLLASTON, WILLIAM HYDE (1766-1828), chemist and natural philosopher, was born at East Dereham, in Norfolk, on August 6, 1766, the second of seventeen children. His father, the Rev. Francis Wollaston, rector of Chislehurst, grandson of William Wollaston noticed above, was an enthusiastic astronomer. Wollaston studied at Caius College, Cambridge, of which he remained a fellow until his death. He took the degree of M.B. in 1787, and that of M.D. six years later, and commenced to practice medicine in 1789 at Bury St. Edmunds. Failing to make headway he removed to London, where he was equally unsuccessful. He applied for a vacant physicianship at St. George's Hospital, but was not appointed; and he never got over the feeling of irritation, which indeed led him to abandon medicine altogether. Wollaston betook himself to original research, and for a time ranged pretty impartially over the sciences. He is said to have accumulated a fortune by the manufacture of platinum and of various optical and mechanical inventions. He devoted much attention to the affairs of the Royal Society, of which he was elected a fellow in 1793 and made secretary in 1806. For many years he was a vice-president, but did not care to enter on competition with Sir Humphrey Davy when the latter was elected president in 1820. Beyond appearing at the meetings of learned societies Wollaston took little part in public affairs; he lived alone, conducting his investigations in a deliberate and very exhaustive manner, but in the most rigid seclusion, no person being admitted to his laboratory on any pretext. Towards the close of 1828 he felt the approach of the fatal malady—a tumor in the brain—and devoted his last days to a careful revisal of his unpublished researches and industrial processes, dictating several papers on these subjects, which were afterwards published in the *Philosophical Transactions.* On December 22, 1828, he died, as he had lived, self-possessed, stern, and silent.

Wollaston's character presents a very remarkable analogy with that of Henry Cavendish: both studied all branches of science; both were highly respected by their contemporaries for intellectual power and achievements in research; both were reserved and distant, making few friends, never acting from impulse, but occasionally displaying unexpected generosity. Wollaston's character can only be partially divined from his public actions and relations with other scientific men, and unfortunately no other data are available. A dispute as to priority in discovering electromagnetic rotation is referred to under FARADAY, vol. ix. p. 27; and suggestions as to the prior invention of his process of manufacturing platinum are to be found in the article PLATINUM (vol. xix. p. 201). The incidents associated with the discovery of the metal palladium were more serious than either of these. Wollaston detected this element, extracted a considerable quantity, and exposed it for sale in an instrument-maker's shop, calling attention to it by an anonymous advertisement. A chemist, Chenevix, purchased some of the metal, and concluded from a few hasty experiments that it was an amalgam of platinum. He submitted a paper to the Royal Society, which Wollaston as secretary read, after, it is said, vainly advising Chenevix to withdraw it. A controversy, supported by elaborate series of experiments, took place, and was only terminated when Wollaston acknowledged that he was the discoverer, and described the process of extraction from the ores of platinum. Chenevix was disgusted, and deserted chemistry. Yet Wollaston was a most thorough and conscientious worker: it was his extreme caution in coming to conclusions until the facts were irresistible that occasionally led him to the unfortunate method of tentative anonymous publication; but the same quality ensured a solidity and trustworthiness in his Royal Society memoirs which make them models to subsequent investigators.

Most of Wollaston's papers deal more or less directly with chemistry, but they diverge beyond that science on all sides into optics, physiology, botany, acoustics, astronomy, and even touch on art. He discovered the metals palladium and rhodium, and proved the identity of columbium with titanium. The minute scale on which his analytical processes were carried out was rendered possible by his extraordinary keenness of sight and neatness in manipulation.

The Royal Society awarded him a royal medal for his process of manufacturing platinum,—a work which, in its immediate effects, it is almost impossible to over-estimate. Wollaston was the first to produce the metal in a state fit to manufacture, and in quantity sufficient to make platinum crucibles generally available, thus supplying analytical chemistry with its most powerful instrument of advance. In optics his most important theoretical observation, to which, however, he gave little attention, was the discovery in 1802 of dark lines in the solar spectrum (see LIGHT, vol. xiv. p. 597), but practically the reflecting GONIOMETER and CAMERA LUCIDA (*qq.v.*) were of greatest value, the former supplying the crystallographer with his chief data, the latter indispensable in the development of modern microscopical research. Amongst his other papers may be mentioned those dealing with the physiology of vision, the apparent direction of the eyes in a portrait, a comparison of the light of the sun with that of the moon and fixed stars, a slide-rule for calculating chemical equivalents, sounds inaudible to certain ears, and a theory of the formation of fairy-rings.

An appreciative essay on the "Life of Wollaston," will be found in George Wilson's *Religio Chemici* (1862).

WOLLIN, an island belonging to Prussia, is the more easterly of the islands at the mouth of the Oder, which separate the Stettiner Haff from the Baltic Sea (vol. xvii. p. 745). It is divided from the mainland on the E. by the Dievenow, and from Usedom on the W. by the Swine. It is roughly triangular in shape, and has an area of 90 square miles. Heath and sand alternate with swamps, lakes, and forest on its surface, which is quite flat, except towards the southwest, where the low hills of Lebbin rise. The coast is fenced with dunes and shifting sand-hills. Cattle-rearing and fishing are the chief resources of the inhabitants, who number about 14,000. Misdroy, on the northwest coast, is a favorite sea-bathing resort, and some of the other villages, as Ostswine, opposite Swinemünde, Pritter, famous for its eels, and Lebbin, are also visited in summer.

WOLLIN, the only town, is situated on the Dievenow, and is connected with the mainland by three bridges. It carries on the industries of a small seaport and fishing-town, and has (1885) a population of 5241. Near the site of the present town once stood the ancient and opulent Baltic capital of the Slavs, called Wolin by the Wends, Julin by the Danes, and Winetha or Vineta by the Germans. Jomsburg, Hynnisborg, and Waltzborg, names or epithets occurring in several of the northern sagas, are said by Schafarik also to refer to this town. In the 10th and 11th centuries Wolin was the centre of an active and extensive trade. Adam of Bremen (d. 1076) extols its size and wealth; he mentions that "Greeks" and other foreigners frequented it, and that "Saxons" were permitted to settle there on equal terms with the Wends, so long as they did not obtrude the fact of their Christianity. In 1125, however, Wolin itself became the seat of a Christian bishopric, which was removed to Cammin in 1170. A colony of Scandinavian vikings, often mentioned in the sagas, flourished in this neighborhood from about 970 till their stronghold of Jomsburg was destroyed in 1083 by Magnus of Norway and Denmark. In 1183 Wolin itself was burned by Canute VI. of Denmark. Within modern times Wollin was captured by the Swedish in 1630 and 1759, and by the Brandenburgers in 1659 and 1675. A tradition long reigned, though now proved to be baseless, that the Wendish Vineta had been overwhelmed by the sea, and some submarine granite blocks near Damerow, in Usedom, were popularly recognized as its ruins. These are still pointed out as such to strangers.

WOLLSTONECRAFT, MARY. See GODWIN, MARY W., and SHELLEY, MARY W.

WOLSEY, THOMAS (*c.* 1471–1530), cardinal, was born at Ipswich, and seems to have been the eldest son, as perhaps he was the eldest of all the four known children, of Robert Wolsey and his wife Joan. The name Wolsey, spelt Wulcy by both Robert and Thomas, is a diminutive of Wulf, that is, Wolf, and clearly proves their descent from those Teutonic folk who gave names to two English counties, to the southern one of which the Wolseys belonged. Simple repetition has made it commonly believed that Robert Wolsey was to trade a butcher. The assertion was first set afloat by enemies of the great cardinal, and was intended to be disparaging. The probability, however, seems to be that he was really a grazier, and perhaps also a wool merchant. He certainly belonged to the better class of merchants, was connected with wealthy people, and himself died possessed of lands and property in and about Ipswich. Fairly trustworthy tradition points to a house in St. Nicholas Street there as occupying the site of his own dwelling. According to Fiddes, supported as to the year by Cavendish, Wolsey's birth happened in March, 1471, though contemporary evidence would place it some years later. His education began doubtless at the grammar school of his native town, where he showed himself an apt scholar. That reputation was fully sustained when he passed to Magdalen College, Oxford, for he took his B.A. degree at the early age of fifteen, whence he was known as "the boy bachelor." He became M.A. with such credit and distinction that he had conferred upon him a fellowship and the mastership of the grammar school attached to his college, of which last in 1498 we find him bursar. The whole course of college training was scholastic; it strengthened and trained the intellect for actual life. Wolsey is said to have been deeply versed in the subtleties of Aquinism; certain it is he remained wholly unaffected by the Greek revival of the Renaissance, and looked but indifferently upon its followers. From arts he went on to the study of divinity, in which the unfriendly Polydore Virgil is compelled to admit he was "not unlearned," but of which he did not become bachelor till 1510. That there was in fact, from whatever cause, some delay in Wolsey's taking orders is evidenced by his father's will, made on the last day of September, 1496, probably just before his death. That instrument appointed Joan sole legatee, and directed "that if Thomas my son be a priest within a year next after my decease," he, or, failing him, another priest, should be paid ten marks, equal to about £60 [$291.60] present money, for a year's singing of masses "for me and my friends."

Among Wolsey's pupils at Magdalen school were three sons of the marquis of Dorset. So well was the marquis satisfied with the progress of his children that he invited Wolsey to spend with him the Christmas holidays of what must have been the year 1499. When Wolsey returned to Oxford it was with the presentation to the quiet Somerset parish of Lymington. In the October following he was inducted. He had not been long placed when a neighboring squire, Sir Amias Paulet, put him in the stocks. The cause of this indignity is not clear; but it was remembered and resented with all the keenness attaching to an injustice suffered. Fifteen years after, as soon as he became lord chancellor, Wolsey summoned Paulet before him, administered a severe rebuke, and ordered him not to leave London without license. From then till 1523 Paulet's name disappears from the state papers, where previously its occurrence had been frequent. In September, 1501, Dorset died, and that event finally decided Wolsey to quit Lymington. Paulet's proceeding had not affected Wolsey's character, for he now became one of the private chaplains of Henry Dean, archbishop of Canterbury. But any hopes he may have founded on this appointment were soon blighted by the death of Dean in February, 1503. Dean's executors, of whom the chief was the favored servant of Henry VII., Sir Reginald Bray, deputed the carrying out of his instructions respecting his funeral to Wolsey and another chaplain. Through Bray, probably, Wolsey next obtained a chaplaincy with another favorite agent of Henry's, Sir Richard Nanfan, deputy-lieutenant of Calais. Nanfan was an old man; and so excellent did Wolsey's business capacity prove that the knight soon entrusted to him the whole work of the deputyship. In 1505 Nanfan resigned and returned to England to pass his latter days in peace; but so thoroughly had his chaplain gained his esteem that, "through his instant labor and especial favor," Wolsey became chaplain to Henry VII. himself, and when in 1506 Sir Richard died Wolsey was one of his executors.

Henry was a cold master, and did not offer much opportunity for making way in his favor, but Wolsey immediately set himself to win the approval of the leading privy councillors, Bishop Fox and Sir Thomas Lovell. As usual he succeeded. And he retained their friendship to the last,—his relations with Fox being perhaps the most beautiful episode in all Wolsey's life. Through their recommendation he began his political life by a mission, probably in 1507, and to the emperor Maximilian. According to Cavendish, who gives Wolsey himself as his authority, not only was the embassy performed in the extraordinarily short space of about eighty hours, but Wolsey took upon him to add to his instructions some items which he afterwards found the king had sent after him. The expedition and bold intelligence displayed established him in the king's good opinion. Other missions ensued, one of them to Scotland in the spring of 1508, all executed to the royal satisfaction. Under Henry high ecclesiastical promotion came by political service. On the 2d February, 1509, Wolsey, who by this time held several minor preferments, was collated to the deanery of Lincoln. Within three months Henry died and his son came to the throne. Already had Wolsey ingratiated himself with the young Henry, and almost at once commenced his unprecedentedly rapid rise to power. Lymington having been resigned by July, he in October received a grant of The Parsonage, part of the forfeited property of Sir Richard Empson; and another month brought him the office and title by which he was chiefly known for the next four years, that of king's almoner. From that time forward his history becomes entwined with the annals of his country, where all that concerns the statesman must be sought.

On the 20th November, 1511, his signature as a privy councillor first occurred. The council was composed of two parties,—the old officials, chiefly ecclesiastics and headed by Fox, who favored peace, and the old nobility, led by Surrey, who advocated a spirited policy, even at the risk of war. Friendship and his cloth naturally attached Wolsey to the former, thereby giving rise to that family hatred of the Howards which pursued him to the end of his life. Fox had long been anxious to withdraw from political life, and he now gradually shifted his state duties on to the willing, able, and younger shoulders of Wolsey. Nor was Wolsey's opportunity of distinguishing himself long in coming. An expedition against Guienne in 1512 had effected nothing and returned in disgrace. This only roused Henry's pride and persistence, and he resolved to invade France from the north in the following year. The organization of the necessary force he committed to Wolsey. Churchman though he was, Wolsey succeeded to admiration. The royal army crossed the Channel, fought what French wit styled the Battle of Spurs, and took Thèrouanne and Tournai, while at home Surrey won the bloody battle of Flodden. Success had crowned Wolsey's labors and covered his royal master with glory. Wolsey's favor with Henry was confirmed. Rewards came thick and fast. On the capture of Tournai, Henry named Wolsey to the bishopric of that see, which just then fell vacant; but the English nomination was never ratified by the pope, who in the end issued bulls promoting the French nominee Guillard. Despite this miscarriage Wolsey was not long in being a bishop. In the succeeding January (1514) the see of Lincoln lost its episcopal head, and next month the new pope Leo X. confirmed Wolsey's appointment to it. The preferment proved but temporary; for in July Cardinal Bainbridge, archbishop of York, was poisoned at Rome, and on the 5th August Wolsey was raised to his place.

Two days later Wolsey brought to a triumphant termination his first great effort in diplomacy, and made with Louis XII. of France a treaty which really undid the notorious league of Cambrai, defeated Ferdinand of Spain with his own weapons, and left England, for the moment, the first power in Europe. Wolsey thereby began a new era in English politics. Since its origin with the Norman Conquest English foreign policy had been bounded by the horizon of France.

It had been dynastic and insular. Wolsey made it European by taking the empire, Italy, and Spain into his calculations. He deliberately set himself to preserve the balance of power in Europe as a means of raising his country from a third to a first rate state. And that end he accomplished solely by diplomacy founded on the successes of 1513, which impressed on Continental statesmen a sense of England's power and thus gave to Wolsey's succeeding diplomacy a weight it would not otherwise have commanded and which it never afterwards lost. The character of the policy accounts for its fluctuations: as the scales turned, so was Wolsey compelled to vary his pressure.

The year 1515 brought him two new honors. For years Warham, archbishop of Canterbury, had desired to be released from the lord chancellorship, and Henry had repeatedly urged Wolsey to accept it. Wolsey naturally shrank from adding to his already arduous duties; but both Warham and the king became so urgent that he at last yielded. By patent dated 21st December he assumed the post, and at once threw himself into its work with his accustomed vigor, dispensing justice and introducing reforms with fearless impartiality. The second dignity, the cardinalate, was obtained through the active intervention of Henry himself, and only by the most threatening arguments did the king overcome the fears and reluctance of Leo. On the 10th September Wolsey was elected cardinal sole. The bearer of the red hat and ring arrived in London in November, and on Sunday the 18th Wolsey was installed amidst all the ceremonial magnificence which he valued not only for his own sake but for his king's. By similar strong measures was wrung from Leo the legateship, an office Wolsey sought in order to carry out ecclesiastical reforms. In 1518 Leo, ostensibly on account of a crusade, sent legates to the four chief courts of Europe. Campeggio, the legate to England, was allowed to reach Calais, where his further progress was stopped till the pope had joined Wolsey with him. Next year Wolsey was appointed sole legate for a year, and, finally, in 1524, following several extensions, he became legate for life, after receiving unusual powers. In virtue of this commission he erected a court and instituted reformations by which he incurred much odium. In 1518 he received the see of Bath and Wells *in commendam*, which in 1523 he resigned for Durham, replaced in turn by Fox's bishopric of Winchester in 1529. At the conclusion of the Calais conference in 1521, Henry recompensed him with the rich abbacy of St. Albans, held, like the episcopates, *in commendam*. From these and other sources he received immense revenues, which were almost entirely devoted to state purposes or national objects. He was prime minister of Henry, and in his income as in his master's there was no distinction between public and private money. Vast sums were used in founding his college at Ipswich and Cardinal College at Oxford, now known as Christ Church, which formed but part of a splendid scheme of national education, a scheme ultimately ruined by the greed of the king. Even what was expended on his own resplendent establishment redounded to the honor of his king and country. His was an age when power and pomp were more closely connected than they are now, and Wolsey's power was extraordinary. "He is in great repute," reported the unfriendly Venetian ambassador Giustinian; "seven times more so than if he were pope." No wonder, then, that he cared but little to fill the papal chair. When, in 1522, and again in 1523, his candidature for the papacy came to nothing, he was not disappointed. And, if in 1529, on the illness of Clement VII., he showed himself seriously anxious on the subject, it was in all likelihood that he might compass Henry's will respecting divorce from Catherine, and prevent that rupture with the apostolic see which he foresaw would result from papal opposition.

Wolsey's favor with the king had been founded on success, and it fell by failure. In the region of politics one diplomatic victory had followed another. The balance had been firmly held between Francis I. and the emperor Charles V., an enterprise rendered memorable by the splendors of the Field of the Cloth of Gold (1520), planned and directed by Wolsey, and amidst which the Middle Ages passed away. Suddenly across his minister's diplomatics Henry dragged the question of the divorce, and everything had to be sacrificed to its accomplishment. Seeing too clearly how much, both personal and national, depended on attaining Henry's desire, Wolsey strove his very uttermost to further a design to which he was himself opposed, stooping to the most discreditable and unworthy means. But the decision lay with Pope Clement, who was in the power of Charles V., Catherine's nephew, and all Wolsey's efforts were in vain. Vain, too, were all attempts to intimidate Catherine herself. A collusive suit was begun before Wolsey by which she was to be condemned unheard; she got word of it and thwarted the plan by demanding counsel. A commission was obtained from the pope for Campeggio and Wolsey to try the cause in England (1529); she appeared before the legatine court at Blackfriars only to appeal to Rome, and thither under imperial pressure Clement revoked the case. It was plain Wolsey had failed, and all Henry's wrath burst out against his too faithful servant. He pointedly employed a secretary, and Wolsey's occupation was gone. Wolsey's foreign policy and domestic reforms had united against him every party and class in the nation, while at the same time he bore the blame of Henry's mistakes and extravagance. So long, however, as his royal master remained true to him he could defy all hostility. But now that the king, too, had turned against him his sole support had given way, and the hungry pack of enemies was unloosed. On the 20th September, Henry parted from Wolsey without any sign of displeasure, but they parted for the last time. Anne Boleyn and her uncle Norfolk were Wolsey's bitter foes. By Anne's sway over Henry Wolsey was kept from the royal presence while Norfolk plotted his ruin. On the 17th October, at the king's command, Wolsey delivered up the great seal to Norfolk and the base ungrateful Suffolk. He was deprived of his dignities, his goods were confiscated, and, surrendering York Place, he retired to Esher. The Court of King's Bench found him guilty in a præmunire, and sentenced him to imprisonment, while a bill precluding his restoration to power or dignities reached the Commons. The bill was dropped, but not till February, 1530, did Henry grant him a full pardon and restore him to the archbishopric of York, on condition that he resigned Winchester and St. Albans. Dreading his proximity to the king, his enemies procured his banishment into his diocese. Thither he went in April, and won the hearts of the people by his simplicity of life and graciousness of manner. His foes were alarmed; his death alone could quiet their fears. He was preparing to be installed archbishop on Monday, 7th November, when on the 4th he was arrested at Cawood Castle by the earl of Northumberland for high treason. On the way south, at Sheffield Park, Nottinghamshire, he was met by Sir William Kingston, keeper of the Tower, and at last Wolsey knew his doom. Long years of toil, anxiety, and the ceaseless vexations of his cruel enemies had shattered his health, and some pears sufficed to bring on dysentery, which was unskilfully treated, and aggravated by Kingston's appearance. Nevertheless, he set out, and by three stages reached Leicester abbey on Saturday, the 26th. "Father abbot," he said, as the convent with its head came out to receive him, "I am come hither to leave my bones among you." He felt that he was dying. Kingston assisted him upstairs, and he at once went to bed. Vomiting and faintings came on, and he rapidly sank, yet his last moments were spent in speaking to Kingston of the objects of his life's best energies, his king and country. At eight o'clock on the morning of the 29th, he died; and within twenty-four hours was buried in a rude coffin all that remained of the genius who made possible the glories of Elizabeth and the British empire of to-day. He left two children, born before he became a bishop, of "one Larke's daughter,"—a son who went by the name of Thomas Winter and was an ecclesiastic, and a daughter who passed as Dorothy Clansey and was a nun.

See *Lives* of Wolsey by Cavendish, Fiddes, and Grove, and J. S. Brewer's *Reign of Henry VIII.*, 1509–30. There is no complete correct account of his life up to 1509, in connection with which see Pinkerton's *History of Scotland*, ii., app. 445–50, along with J. Gardiner's *Letters and Papers, etc., of Richard III. and Henry VII.*, M. R. Series, pref.; and *Letters*, etc., pref. and i., app. B, 426–52. An excellent short view of Wolsey as a statesman will be found in Prof. M. Creighton's *Thomas Wolsey*. (T. W. C.)

WOLVERHAMPTON, a municipal and parliamentary borough and market-town of Staffordshire, England, one of the principal seats of the hardware manufacture in the Midlands, is situated on an eminence commanding an extensive view towards Wales, on the Birmingham and Liverpool, the Staffordshire and Worcestershire, and the Wyrley and Essington Canals, and on the London and Northwestern, the Midland, and the Great Western Railways, 13 miles northwest of Birmingham, 16 south of Stafford, and 126 from London. The principal streets diverge from Queen Square, and are for the most part regular and well built, with numerous handsome shops. Towards the west there are pleasant suburbs of villas, the country being rich and well wooded. The old church of Wolverhampton, founded by Wulfruna in 996 and dedicated to the Virgin, was in the reign of Henry III. rededicated to St. Peter. It has undergone frequent alterations, and in 1862–65 underwent extensive restoration. It is now a fine cruciform building with south porch and central tower. Internally, the church consists of a long and lofty nave with side aisles and north and south transepts, and terminating in a chancel with apsidal ending. The lower portion of the tower, south transept, etc., belong to the 13th century; the nave, clerestory, upper part of the tower, and north transept were erected in the 15th century; and the chancel is wholly modern, having been rebuilt in 1865. Wolverhampton was formerly a deanery, and on its abolition in 1846 the township was divided into ecclesiastical parishes, the number of which is now thirteen. At the old free grammar school, founded in 1515 by Sir Stephen Jenyns, a native of the town and an alderman of London, Sir W. Congreve and Dr. Abernethy received their education. New buildings for the school were erected in 1876, in the western part of the town at a cost of £22,000 [$106,920]. There is also a blue-coat school, founded in 1710. The other principal public buildings are the town-hall (1871), the corn exchange (1851, £15,000 [$72,900]), the market-hall (1853, £10,500 [$51,030]), the agricultural hall (1863, £6000 [$29,160]), the public baths (1850), the post-office (1873), the art gallery, musuem, and school of art (1884–85), and the free library. There is a cattle market about 5 acres in extent, and also a large pig market. The theatre royal (1844) is a handsome building in the Doric style. The benevolent institutions include a general hospital, the eye infirmary, the orphan asylum, and the institute of the society for outdoor blind. In Queen Square there is an equestrian statue of the late Prince Consort, unveiled by the queen in 1866, and on Snow Hill a statue in Sicilian marble (1879) of the Right Honorable Charles Pelham Villiers, who has represented the borough from 1835 to the present time (1888). Street improvements have been carried out on a large scale within recent years. Main drainage works on a thorough method have also been completed, and a large farm purchased for the utilization of the sewage. The water-works, opened in 1847, belong to the corporation. The water is supplied from springs in the Red Sandstone by wells sunk to a great depth. The old racecourse, 50 acres in extent, has been laid out as a public park; and a new racecourse was opened in 1887. The population of the municipal borough and urban sanitary district (area 3396 acres) in 1871 was 68,291, and in 1881 it was 75,766 (males 37,827, females 37,939); while that of the parliamentary borough (18,888 acres) was 156,978 in 1871, and 164,332 (males 82,657, females 81,675) in 1881.

Situated in a district abounding in coal and ironstone, Wolverhampton has become famous for the manufacture both of the heavier and the smaller kinds of iron-wares, although in the finer class of metal manufactures for which the neighboring town of Birmingham is famous it has little or no share. It possesses large smelting furnaces, and iron and brass foundries, but is specially occupied in the manufacture of all kinds of iron implements, tools, and domestic requisites, including locks and fastenings, hinges and nails, kitchen furniture, gardeners', wrights', and smiths' tools and implements, tinplate goods, and every variety of japanned ware, of which it may be regarded as the principal seat. There are also extensive clay-retort works, chemical works, grease works, dye-works, varnish works, coach works, corn and saw mills, cooperages, ropewalks, maltings, and breweries.

The place was originally called Hanton or Hamtune, but on the foundation of a college for a dean and secular canons in 996 by Wulfruna, sister of Ethelred II. and widow of Anthelm, duke of Northumberland, it was named Wulfrunahamton. By William Rufus the church was placed under the care of Sampson, bishop of Worcester, who settled it on a prior and convent of his own cathedral. In the reign of Stephen it was taken possession of by Roger, bishop of Salisbury, and subsequently it came into the hands of the secular canons, who held it until Dean Peter of Blois resigned it to Hubert, archbishop of Canterbury, that he might build an abbey of Cistercian monks. The church was accounted one of the king's free chapels, and was annexed by Edward IV. to the deanery of Windsor. The college and prebends were granted to the duke of Northumberland in the reign of Edward VI., and on his attainder they came again to the crown. The deanery and prebends were refounded by Queen Mary, and this was confirmed by James I. The town received the grant of a market and fair from Henry III. in 1258. It suffered severely from fire in 1590, the conflagration lasting five days. During the Civil War its sympathies were Royalist, and it was visited by Charles I., accompanied by his sons Charles and James. In 1645 it was for a time the headquarters of Prince Rupert. Its importance as a seat of manufactures is entirely of modern date and due to the rise of the iron industry. Although it received the privilege of returning members to parliament in 1832, it was not incorporated as a municipal borough till 1848. It is divided into eight wards, and is governed by a mayor, 12 aldermen, and 36 councillors. It has separate commissions of the peace and quarter sessions. In 1885 the number of its parliamentary representatives was increased to three, the borough being separated into three parliamentary divisions—East, South, and West.

WOMBAT. The animals which have received this name belong to the Marsupial family *Phascolomyidæ* (see MAMMALIA, vol. xv. p. 386). They have the following dental formula: $i\,\frac{1}{1}$, $c\,\frac{0}{0}$, $p\,\frac{1}{1}$, $m\,\frac{4}{4} = \frac{6}{6}$; total 24. All the teeth are of continuous growth, having persistent pulps. The incisors are large and scalpriform, much as in Rodents. The body is broad and depressed, the neck short, the head large and flat, the eyes small. The tail is rudimentary, hidden in the fur. The limbs are equal, stout, and short. The feet have broad, naked, tuberculated soles; the fore-feet with five distinct toes, each furnished with a long, strong, and slightly curved nail, the first and fifth considerably shorter than the other three. The hind feet have a very short nailless hallux; the second, third, and fourth toes partially united by integument, of nearly equal length; the fifth distinct and rather shorter; these four are provided with long and curved nails.

There are two distinct forms of wombat:

(1) *Phascolomys* proper. Fur rough and coarse. Ears short and rounded. Muffle naked. Post-orbital process of the frontal bone obsolete. Ribs fifteen pairs. Vertebræ: C 7, D 15, L 4, S 4, C 10–12. The wombat of Tasmania and the islands of Bass's Straits (*P. ursinus*) and the closely similar but larger animal of

the southern portion of the mainland of Australia (*P. platyrhinus*) belong to this form.

(2) *Lasiorhinus.* Fur smooth and silky. Ears large and more pointed. Muffle hairy. Frontal region of skull broader than in the other section, with well-marked post-orbital processes. Ribs thirteen. Vertebræ: C 7, D 13, L 6, S 4, C 15–16. One species, *P. latifrons*, the Hairy-Nosed Wombat of Southern Australia.

In their general form and actions the wombats resemble small bears, having a somewhat similar shuffling manner of walking, but they are still shorter in the legs, and have broader flatter backs than bears. They live entirely on the ground, or in burrows or holes among rocks, never climbing trees, and they feed entirely on grass, roots, and other vegetable substances. They sleep during the day, and wander forth at night in search of food, and are shy and gentle in their habits generally, though they can bite strongly when provoked. The only noise the common wombat makes is a low kind of hissing, but the hairy-nosed wombat is said to emit a short quick grunt when annoyed. The prevailing color of the last-named species, as well as *P. ursinus* of Tasmania, is a brownish gray. The large wombat of the mainland is very variable in color, some individuals being found of a pale yellowish brown, others dark gray, and some quite black. The length of head and body is about three feet. Fossil remains of wombats, some of larger size than any now existing, have been found in caves and post-Pliocene deposits in Australia, but in no other part of the world.

Common Wombat (*Phascolomys ursinus*).

(W. H. F.)

WOMBWELL, a township of England, in the West Riding of Yorkshire, on the Manchester, Sheffield, and Lincolnshire Railway, 4½ miles southeast of Barnsley, 7 northwest of Rotherham, and 184 from London by rail. The church of St. Mary is an ancient structure, enlarged and altered in 1835. The inhabitants are chiefly employed in the extensive collieries. The population of the urban sanitary district (area 3851 acres) in 1871 was 5009, and in 1881 it was 8451.

WOMEN, Law relating to. The law as it relates to women has been gradual in its development, but its tendency has been almost uniformly in one direction. Disabilities of women, married or unmarried, have been one after another removed, until at the present day, in most civilized countries, the legal position of women differs little from that of men as far as regards private rights. Politically and professionally the sexes are still not upon an equality, but even in this aspect women have considerably greater rights than they once possessed, and the old theory of their intellectual and moral inferiority is virtually exploded. Those who defend their exclusion must now do so on other grounds. Much of the law relating to married women has been already dealt with under the heads of Adultery, Bigamy, Divorce, Marriage, Husband and Wife, and Settlement, the last two especially dealing with their rights of property.

The dependent position of women in early law is proved by the evidence of most ancient systems which have in whole or in part descended to us. In the Mosaic law divorce was a privilege of the husband only,[1] the vow of a woman might be disallowed by her father or husband,[2] and daughters could inherit only in the absence of sons, and then they must marry in their tribe.[3] The guilt or innocence of a wife accused of adultery might be tried by the ordeal of the bitter water.[4] Besides these instances, which illustrate the subordination of women, there was much legislation dealing with, *inter alia*, offences against chastity, and marriage of a man with a captive heathen woman or with a purchased slave. So far from second marriages being restrained, as they were by Christian legislation, it was the duty of a childless widow to marry her deceased husband's brother. In India subjection was a cardinal principle. "Day and night must women be held by their protectors in a state of dependence," says Manu.[5] The rule of inheritance was agnatic, that is, descent traced through males to the exclusion of females.[6] The gradual growth of *Stridhana*, or property of a woman given by the husband before or after marriage, or by the wife's family, was probably what led to the suttee, for both the family of the widow and the Brahmans had an interest in getting the life estate of a woman out of the way.[7] Women in Hindu law had only limited rights of inheritance, and were disqualified as witnesses. In Roman law a woman was even in historic times completely dependent. If married she and her property passed into the power of her husband; if unmarried she was (unless a vestal virgin) under the perpetual tutelage of her father during his life, and after his death of her agnates, that is, those of her kinsmen by blood or adoption who would have been under the power of the common ancestor had he lived. Failing agnates, the tutelage probably passed to the *gens*. The wife was the purchased property of her husband, and, like a slave, acquired only for his benefit. A woman could not exercise any civil or public office. In the words of Ulpian, "feminæ ab omnibus officiis civilibus vel publicis remotæ sunt."[8] A woman could not continue a family, for she was "caput et finis familiæ suæ,"[9] could not be a witness, surety, tutor, or curator; she could not adopt or be adopted, or make a will or contract. She could not succeed *ab intestato* as an agnate, if further removed than a sister. A daughter might be disinherited by a general clause, a son only by name. On the other hand, a woman was privileged in some matters, but rather from a feeling of pity for her bodily weakness and presumed mental incapacity[10] than for any more worthy reason. Thus she could plead ignorance of law as a ground for dissolving an obligation, which a man could not as a rule do; she could accuse only in cases of treason and witchcraft; and she was in certain cases exempt from torture. In succession *ab intestato* to immovable property Roman law did not, as does English, recognize any privilege of males over females. Legal disabilities were gradually mitigated by the influence of fictions, the prætorian equity, and legislation. An example of the first was the mode by which a woman freed herself from the authority of her tutor by fictitious cession into the authority of a tutor nominated by herself, or by sale of herself into the power of a nominal husband on the understanding that he was at once to emancipate her to another person, who then manumitted her. The action of equity is illustrated by the recognition by the prætor of cognatic or natural as distinguished from agnatic or artificial relationship, and of a widow's claim to succeed on the death of her husband intestate and without relations. Legislation, beginning as early as the Twelve Tables, which forbade excessive mourning for the dead by female mourners, did not progress uniformly towards enfranchisement of women. For instance, the Lex Voconia (about 169 B.C.), called by St. Augustine the most unjust of all laws, provided that a woman could not be instituted heir to a man who was registered as owner of a fortune of 100,000 asses [$793.33].[1] A constitution of Valentinian I. forbade bequests by women to ecclesiastics. But the tendency of legislation was undoubtedly in the direction indicated. Adoption of women was allowed by Diocletian and Maximian in 291. The tutelage of women of full age was removed by Claudius, and, though afterwards in part revived, has disappeared by the time of Justinian. This implied full testamentary and contractual liberty. In regard to the separate property of the married woman, the period of *dos* had by the time of Justinian long superseded the period of *manus* (see SETTLEMENT). The result was that, in spite of a few remaining disabilities, such as the general incapacity to be surety or witness to a will or contract, of a wife to make a gift to her husband, of a widow to marry within a year of her husband's death, the position of women had become, in the words of Sir H. Maine, "one of great personal and proprietary independence."[2] For this improvement in their position they were largely indebted to the legislation of the Christian emperors, especially of Justinian, who prided himself on being a protector of women. The following are a few of the matters in which Christianity appears to have made alterations, generally but perhaps not always improvements, in the law. As a rule the influence of the church was exercised in favor of the abolition of the disabilities imposed by the older law upon celibacy and childlessness, of increased facilities for entering a professed religious life,[3] and of due provision for the wife. The church also supported the political power of those who were her best friends. The government of Pulcheria or Irene would hardly have been endured in the days of the pagan empire. Other cases in which Christianity probably exercised influence may be briefly stated. (1) All differences in the law of succession *ab intestato* of males and females were abolished by Justinian. (2) The appointment of mothers and grandmothers as tutors was sanctioned by the same emperor. (3) He extended to all cases the principle established by the Senatus Consultum Tertullianum (158), enabling the mother of three (if a freed woman four) children to succeed to the property of her children who died intestate, and gave increased rights of succession to a widow. (4) The restrictions on the marriage of senators and other men of high rank with women of low rank were extended by Constantine, but almost entirely removed by Justinian. (5) Second marriages were discouraged (especially by making it legal to impose a condition that a widow's right to property should cease on re-marriage), and the Leonine Constitutions at the end of the 9th century made third marriages punishable. (6) The same constitutions made the benediction of a priest a necessary part of the ceremony of marriage.[4] The criminal law in its relation to women presents some points of interest. Adultery was punished with death by Constantine, but the penalty was reduced by Justinian to relegation to a convent. A woman condemned for adultery could not re-marry. A marriage between a Christian and a Jew rendered the parties guilty of adultery. Severe laws were enacted against offences of unchastity, especially procurement and incest. It was a capital crime to carry off or offer violence to a nun. A wife could not commit *furtum* of her husband's goods, but he had a special action *rerum amotarum* against her. By several sumptuary constitutions, contained in the *Code*, bk. xi., women as well as men were subject to penalties for wearing dress or ornaments (except rings) imitating those reserved for the emperor and his family. Actresses and women of bad fame were not to wear the dress of virgins dedicated to Heaven. If a consul had a wife or mother living with him, he was allowed to incur greater expense than if he lived alone. The interests of working women were protected by enactments for the regulation of the *gynæcia*, or workshops for spinning, dyeing, etc.

[8] *Dig.*, i. 16, 195.

[9] *Ibid.*

[10] *Imbecillitas* is the term used more than once in the texts of Roman law.

The canon law, looking with disfavor on the female independence prevailing in the later Roman law, tended rather in the opposite direction. The *Decretum* specially inculcated subjection of the wife to the husband, and obedience to his will in all things.[5] The chief differences between canon and Roman law were in the law of marriage, especially in the introduction of publicity and of the formalities of the ring and the kiss. The benediction of a priest was made a necessary part of the ceremony, as indeed it had been made by the civil power, as has been already stated, in the post-Justinian period of Roman law. But in practice this rule appears to have fallen into disuse until it was again revived by the council of Trent. It was, however, the rule of the English common law after the Reformation. The ceremony was not to be performed during Lent. The woman was to be veiled during the ceremony. A promise of marriage was so sacred that it made a subsequent marriage with another person void. Spiritual cognation was a bar to marriage. The sentence of the church was made necessary for divorce. As to women in general the law does not say very much. Women, even relatives, were not to live with priests unless in case of necessity. They were not to approach the altar or fill any public office of the church; nor might they lend money on usury. Baptism might be valid although administered by a woman. Women who had professed religion could not be forced to give evidence as witnesses. In some cases the evidence of women was not receivable (see WITNESS).[6]

The early law of the northern parts of Europe is interesting from the different ways in which it treated women. In the words of Sir H. Maine[7]—"The position of women in these barbarous systems of inheritance varies very greatly. Sometimes they inherit, either as individuals or as classes, only when males of the same generation have failed. Sometimes they do not inherit, but transmit a right of inheritance to their male issue. Sometimes they succeed to one kind of property, for the most part movable property, which they probably took a great share in producing by their household labor; for example, in the real Salic law (not in the imaginary code) there is a set of rules of succession which, in my opinion, clearly admit women and their descendants to a share in the inheritance of movable property, but confine land exclusively to males and the descendants of males. . . . The idea is that the proper mode of providing for a woman is by giving her a marriage portion; but, when she is once married into a separate community consisting of strangers in blood, neither she nor her children are deemed to have any further claim on the parent group." Among the Scandinavian races women were under perpetual tutelage, whether married or unmarried. The first to obtain freedom were the widows.[1] As late as the code of Christian V., at the end of the 17th century, it was enacted that if a woman married without the consent of her tutor he might have, if he wished, administration and usufruct of her goods during her life.[2] The provision made by the Scandinavian laws under the name of morning-gift was perhaps the parent of the modern settled property.[3] The Brehon law of Ireland excepted women from the ordinary course of the law. They could distrain or contract only in certain named cases, and distress upon their property was regulated by special rules. In the pre-Conquest codes in England severe laws were denounced against unchastity, and by a law of Canute a woman was to lose nose and ears for adultery. The laws of Athelstan contained the peculiarly brutal provision for the punishment of a female slave convicted of theft by her being burned alive by eighty other female slaves. Other laws were directed against the practice of WITCHCRAFT (*q.v.*) by women. Monogamy was enforced both by the civil and ecclesiastical law; and second and third marriages involved penance. A glimpse of cruelty in the household is afforded by the provision, occurring no less than three times in the ecclesiastical legislation, that if a woman scourged her female slave to death she must do penance. Traces of wife-purchase are seen in the law of Ethelbert, enacting that if a man carry off a freeman's wife he must at his own expense procure the husband another wife. The codes contain few provisions as to the property of married women, but those few appear to prove that she was in a better position than at a later period. The laws of Ine gave her a third of her husband's property; the laws of Edmund as to betrothal allowed this to be increased to half by antenuptial contract, to the whole if she had children and did not re-marry after her husband's death. No doubt the dower *ad ostium ecclesiæ* favored by the church generally superseded the legal rights where the property was large—in fact this is specially provided by Magna Charta, c. 7—just as at present rights under a marriage settlement take the place of those given by statute. "Provisio hominis tollit provisionem legis." The legal rights of a married woman apart from contract were gradually limited, until by the time of Glanvill her person and property had become during her husband's lifetime entirely at his disposal, and after his death limited to her dower and her *pars rationabilis* (see WILL).

---

[1] The way in which this law was evaded was by non-enrolment of the testator in the census (see Montesquieu, *Esprit des Lois*, bk. xxvii.). Another way was by leaving her the inheritance by *fideicommissum* (see TRUST).

[2] *Ancient Law*, ch. v. Hence the necessity of such laws as the Lex Oppia (see SUMPTUARY LAWS).

[3] A remarkable example of this tendency was the provision that an actress might leave the stage and break her contract of service with impunity in order to become a nun (see THEATRE). Even under the pagan emperors a constitution of Diocletian and Maximian in 285 had enacted that no one was to be compelled to marry (*Cod.*, v. 4, 14).

[4] See Troplong, *De l'Influence du Christianisme sur le Droit Civil.*

[5] Pt. ii. caus. xxxiii. qu. v. ch. 16.

[6] On this branch of the subject Manssen's *Het Christendom en de Vrouw* (Leyden, 1877) may be consulted with advantage.

[7] *Early Law and Custom*, ch. v.

A few of the more interesting matters in which the old common and statute law of England placed women in a special position may be noticed. A woman was exempt from legal duties more particularly attaching to men and not performable by deputy. She could apparently originally not hold a proper feud, *i.e.*, one of which the tenure was by military service.[4] The same principle appears in the rule that she could not be endowed of a castle maintained for the defence of the realm and not for the private use of the owner. She could receive homage, but not render it in the form used by men, and she was privileged from suit and service at the sheriff's tourn. She was not sworn to the law by the oath of allegiance in the leet or tourn, and so could not be outlawed (see OUTLAW), but was said to be waived. She could be constable, either of a castle or a vill, but not sheriff, unless in the one case of Westmorland, an hereditary office, exercised in person in the 17th century by the famous Anne, countess of Dorset, Pembroke, and Montgomery. In certain cases a woman could transmit rights which she could not enjoy. On such a power of transmission, as Sir H. Maine shows,[5] rested the claim of Edward III. to the crown of France. The claim *through* a woman was not a breach of the French constitutional law, which rejected the claim *of* a woman. The jealousy of a woman's political influence is strikingly shown by the case of Alice Perrers, the mistress of Edward III. She was accused of breaking an ordinance by which women had been forbidden to do business for hire and by way of maintenance in the king's court.[6]

By Magna Charta a woman could not appeal any one for murder except that of her husband. This disability no doubt arose from the fact that in trial by battle she naturally did not appear in person but by a champion. She was not admitted as a witness to prove the status of a man on the question arising whether he were free or a villein. She could not appoint a testamentary guardian, and could only be a guardian even of her own children to a limited extent. Her will was revoked by marriage, that of a man only by marriage and the subsequent birth of a child (see WILL). By 31 Hen. VI. c. 9 the king's writ out of chancery was granted to a woman alleging that she had become bound by an obligation through force or fraud. By 39 Hen. VI. c. 2 a woman might have livery of land as heiress at fourteen. Benefit of clergy was first allowed to women partially by 21 Jac. I. c. 6, fully by 3 Will. and M. c. 9 and 4 and 5 Will. and M. c. 24.[7] Public whipping was not abolished until 57 Geo. III. c. 75, whipping in all cases until 1 Geo. IV. c. 57. Burning was the punishment specially appropriated to women convicted of treason or witchcraft. A case of sentence to execution by burning for petit treason[8] occurred as lately as 1784. In some old statutes very curious sumptuary regulations as to women's dress occur. By the sumptuary laws of Edward III. in 1363 (37 Edw. III. cc. 8–14) women were in general to be dressed according to the position of their fathers or husbands. Wives and daughters of servants were not to wear veils above twelve pence [78 cts.] in value. Handicraftsmen's and yeomen's wives were not to wear silk veils. The use of fur was confined to the ladies of knights with a rental above 200 marks [$628] a year. Careful observance of difference of rank in the dress was also inculcated by 3 Edw. IV. c. 5. The wife or daughter of a knight was not to wear cloth of gold or sable fur, of a knight-bachelor not velvet, of an esquire or gentleman not velvet, satin, or ermine, of a laborer not clothes beyond a certain price or a girdle garnished with silver. By 22 Edw. IV. c. 1, cloth of gold and purple silk were confined to women of the royal family. It is worthy of notice that at the times of passing these sumptuary laws the trade interests of women were protected by the legislature. By 37 Edw. III. c. 6, handicraftsmen were to use only one mystery, but women might work as they had been accustomed. 3 Edw. IV. c. 3 forbade importation of silk and lace by Lombards and other alien strangers, imagining to destroy the craft of the silk spinsters and all such virtuous occupations for women. In some cases the wives and daughters of tradesmen were allowed to assist in the trades of their husbands and fathers; see, for instance, the Act concerning tanners, 1 Jac. I. c. 22. Some trading corporations, such as the East India Company, recognized no distinction of sex in their members. The disabilities imposed on women by substantive law are sometimes traceable in the early law of procedure. For instance, by the Statute of Essoins (12 Edw. II. st. 2), essoin *de servitio regis* did not lie where the party was a woman; that is, a woman (with a few exceptions) could not excuse her absence from court by alleging that she was on public duty. The influence of the church is very clearly traceable in some of the earlier criminal legislation. Thus by 13 Edw. I. st. 1, c. 34, it was punishable with three years' imprisonment to carry away a nun, even with her consent. The Six Articles, 31 Hen. VIII. c. 14, forbade marriage and concubinage of priests and sanctioned vows of chastity by women.

[1] See Stiernhöök, *De Jure Sveonum* (Stockholm, 1672), bk. ii. ch. i.: Messenius, *Leges Svecorum* (Stockholm, 1714).

[2] Bk. iii. ch. xvi. §§ 1, 2.

[3] The development of the bride-price no doubt was in the same direction. Its original meaning was, however, different. It was the sum paid by the husband to the wife's family for the purchase of part of the family property, while the morning-gift was paid as *pretium virginitatis* to the bride herself. In its English form morning-gift occurs in the laws of Canute; in its Latinized form of *morgangiva* it occurs in the *Leges Henrici Primi*.

[4] It is remarkable that the great fiefs of France except the Isle of France, the special apanage of the crown, all became in time female fiefs. This is shown by the table at the end of Laboulaye's *Recherches*.

[5] *Early Law and Custom*, ch. v.

[6] *Rot. Parl.*, vol. iii. p. 12.

[7] [Until then women "received sentence of death and might have been executed for first offence in simple larceny merely because their sex precluded the possibility of their taking holy orders, although a man who could read was, for the same crime, subject only to burning in the hand and a few months' imprisonment."—AM. ED.]

[8] ["If the *baron* kills his *feme* it is the same as if he had killed a stranger: but if the *feme* kills her *baron* it is regarded as a much more atrocious crime. She not only breaks through the restraints of humanity and affection, but throws off all subjection to the authority of her husband. Therefore the law denominates her crime a species of treason and condemns her to the same punishment as if she had killed her king."—AM. ED.]

English law.

The present position of women in English law may be treated, for purposes of convenience, under several heads. Sex alone, as will appear, does not determine the law; sex and marriage together must often be taken into consideration.

Political rights.

Political Rights.—This branch of the law is full of singular anomalies. A woman may fill some of the highest positions in the state. She may be a queen, a regent, or a peeress in her own right.[1] A queen regnant has, by 1 Mary, sess. 3, c. 1, as full rights as a king. A peeress is entitled, by 20 Hen. VI. c. 9, to be tried like a peer by the House of Lords or the court of the lord high steward (see TRIAL), and has a seat in the House of Lords, but no right of speaking or voting. Other public offices which a woman can fill are those of overseer, guardian of the poor, churchwarden, and sexton. She may also, if married, be one of a jury of matrons empanelled to determine the question of pregnancy of a widow on a writ *de ventre inspiciendo* or of a female prisoner, but she cannot serve on an ordinary jury. If unmarried or a widow she can vote in municipal, school board, local government, poor law, and other elections of a local character (such as polls of ratepayers under the Free Libraries and Borough Funds Acts), and can be a member (whether married or not) of a school board, but apparently not an overseer or guardian if married and living with her husband. She cannot be registered as a voter or vote at a parliamentary election or be elected a member of parliament. It was decided in 1868 that the words of Lord Brougham's Act (13 and 14 Vict. c. 21, § 4), by which in all Acts words importing the masculine gender are to be taken to include females unless the contrary is expressly provided, did not bring a woman within the word "man" in the Representation of the People Act, 1867.[2] The same would no doubt be held, if the point were raised, under the Representation of the People Act, 1884. The question of granting the parliamentary franchise to women was first brought before the House of Commons by John Stuart Mill in 1867, as an amendment to the Representation of the People Bill of that year, and has uniformly been rejected on that and several subsequent occasions. At present the Isle of Man is the only part of the United Kingdom where such a right exists. It was there conceded in 1882 to unmarried women with sufficient property qualification. For the precedence of women, see PRECEDENCE. The national status of married women and widows is provided for by the Naturalization Act, 1870.

Professions and trades.

Professions and Trades.—The only one of the learned professions open to women is the medical. Such rights as may be possessed by the Society of Apothecaries and the College of Surgeons to admit women to their respective qualifications are specially saved by 37 and 38 Vict. c. 34 and 38 and 39 Vict. c. 43. By an Act of 1876 (39 and 40 Vict. c. 41) medical qualifications may be granted, irrespective of sex, by anybody empowered to grant such qualifications. As a matter of fact the College of Surgeons does not at present allow women to qualify, but the Society of Apothecaries and the College of Surgeons of Ireland and the King's and Queen's College of Physicians in Ireland follow the more liberal course. Admission to degrees, medical and others, in the universities is only allowed to a limited extent. Oxford and Cambridge admit women to examinations, but not to degrees. London, under its supplemental charter of 1878, admits to all degrees. The University Education (Ireland) Act, 1879, contains a section empowering the Royal University of Ireland to examine women for degrees and certificates of proficiency. The Endowed Schools Act, 1869, provides for extending to girls the benefits of educational endowments. A similar provision is included in the City of London Parochial Charities Act, 1883. Under the powers of these Acts, as well as by private munificence, a considerable sum of money has been during the last few years provided for the purposes of female education. Special regulations are made by the Factories and Mines Acts as to the employment of women and girls in factories and mines. Under no circumstances is a woman allowed to work underground. The Shop Hours Regulation Act, 1886 (a temporary provision), forbids the employment in shops of girls under eighteen for more than seventy-four hours in a week. Women have recently been employed to a greater extent than formerly in Government departments, especially in the post-office. A married woman may, since the Married Women's Property Act, 1882, carry on a trade separately from her husband, and in such a case is liable to be made a bankrupt. She may apparently be a partner of her husband, and may lend him money, but in this case her claim to a dividend on his bankruptcy is postponed to that of other creditors.

Family rights.

Family Rights.—The age at which a girl can contract a valid marriage is, following Roman law, twelve; she is thus two years in advance of a boy, who must be fourteen. Under the Infants Settlement Act (see SETTLEMENT) a valid settlement can be made by a woman at seventeen with the approval of the court, the age for a man being twenty. An unmarried woman is liable for the support of illegitimate children till they attain the age of sixteen. She is generally assisted, in the absence of agreement, by an affiliation order granted by magistrates. A married woman having separate property is, under the Married Women's Property Act, liable for the support of her husband, children, and grandchildren becoming chargeable to any union or parish. At common law the father was entitled as against the mother to the custody of a legitimate child up to the age of sixteen, and could only forfeit such right by misconduct. But the Court of Chancery, wherever there was trust property and the infant could be made a ward of court, took a less rigid view of the paternal rights and looked more to the interest of the child, and consequently in some cases to the extension of the mother's rights at common law. Legislation has tended in the same direction. By 36 Vict. c. 12 the Court of Chancery was empowered to enforce a provision in a separation deed, giving up the custody or control of a child to the mother. The Judicature Act, 1873, § 25 (10), enacted that in questions relating to the custody and education of infants the rules of equity should prevail. The Guardianship of Infants Act, 1886, largely extended the mother's powers of appointing and acting as a guardian, and gave the court a discretion to regard the mother's wishes as to the custody of the children. The children of women convicted of crime or frequenting the company of prostitutes may be sent to an industrial school. The principal disabilities under which women are now placed may perhaps be classed under the head of family rights, viz., exclusion of female heirs from intestate succession to real estate, unless in absence of a male heir (see INHERITANCE, PRIMOGENITURE), and the obtaining of DIVORCE (*q.v.*) by a husband for the adultery of his wife, while the wife can only obtain it for adultery coupled with some further cause, such as cruelty or desertion.

Rights of property.

Rights of Property.—Unmarried women and widows have practically equal rights with men. Since the date of the article HUSBAND AND WIFE the Married Women's Property Act, 1882, has extended the change in the law attempted to a limited degree by the previous Acts of 1870 and 1874. The most important provisions of the Act (45 and 46 Vict. c. 75) falling under this head are the following: A married woman is capable of acquiring, holding, and disposing by will or otherwise of any real and personal property as her separate property, in the same manner as if she were a *feme sole*, without the intervention of any trustee. Every contract entered into by a married woman is to be deemed to bind her separate property, unless the contrary be shown. Property of a woman married after the commencement of the Act,[1] whether belonging to her at the time of marriage or acquired after marriage, is to be held by her as a *feme sole.* The same is the case with property acquired after the commencement of the Act by a woman married before the Act. After marriage a woman remains liable for antenuptial debts and liabilities, and as between her and her husband, in the absence of a contract to the contrary, her separate property is to be deemed primarily liable. The husband is only liable to the extent of property acquired from or through his wife. The Act also contains provisions as to stock, investment, insurance, evidence (see WITNESS), and other matters. The effect of the Act is to render obsolete the old law as to what creates a separate use or a reduction into possession of choses in action (see PERSONAL ESTATE), as to equity to a settlement, as to fraud on the husband's marital rights,[2] and as to the inability of one of two married persons to give a gift to the other. Also, in the case of a gift to a husband and wife in terms which would make them joint-tenants if unmarried, they no longer take as one person but as two. The construction of the Act by the courts has been in one or two cases perhaps somewhat narrow; still there is no doubt that it has affected the proprietary rights of married women to an immense extent. Its effect has been principally to improve the position of wives of the humbler class unprotected by marriage settlement. There is a special saving in the Act of existing and future settlement. A settlement is still necessary where it is desired to secure only the enjoyment of the income to the wife and to provide for children. The Act by itself would enable the wife, without regard to family claims, instantly to part with the whole of any property which might come to her. Restraint on anticipation, a means of protecting a married woman's property from her husband's influence, is also preserved by the Act, subject to the liability of such property for antenuptial debts, and to the power given to the court by the Conveyancing Act, 1881, to bind a married woman's interest, notwithstanding a clause of restraint. This possibility of being restrained from anticipation is now one of the principal points of difference between the proprietary rights of men and women. Formerly remaining unmarried could be attached as a condition of the enjoyment of property by a widow only, but it has been recently decided that such a condition may be imposed upon a widower as well. In one case, however, the widow has still an advantage over the widower. Limitations contained in her marriage settlement in favor of her children by a former marriage are not treated as voluntary, while similar limitations in the settlement of a widower are regarded as voluntary, and therefore void as against a subsequent mortgagee of the settled property.[3] By Magna Charta, c. 7, a widow is to have her QUARANTINE (*q.v.*), and is not to be forced to re-marry.

---

[1] Most peeresses are those who have succeeded to ancient peerages by writ. Modern peerages are almost always limited to heirs-male.

[2] Chorlton *v.* Lings, *Law Rep.*, 4 Common Pleas, 374.

Procedure.

Procedure.—An action for breach of promise of marriage[4] and an affiliation summons under the Bastardy Acts are, the former practically, the latter entirely, confined to women. An action of SEDUCTION (*q.v.*), though not brought in England by the woman herself, is for injury suffered by her. The rules of the Supreme Court and the Married Women's Property Act contain various provisions for the bringing and defending of actions by married women. The main provision is § 1 (2) of the Act, enabling a married woman to sue and be sued, either in contract or in tort or otherwise, in all respects as if she were a *feme sole.*[5] Her position, however, is not, owing to the judicial interpretation of the Act, as completely independent as the words of the Act would at first sight appear to imply. It has been held, for instance, that she cannot since the Act, any more than before it, be next friend or guardian *ad litem* of an infant. The husband and wife too may still be sued jointly for a tort committed by the wife after marriage. Apart from proceedings for divorce or judicial separation, a husband cannot sue his wife for a tort committed during the coverture, nor a wife her husband, unless for the protection and security of her separate property. She can, however, cause him to be bound over in recognizances to keep the peace towards her, in case of violence on his part. The Married Women's Property Act contains a useful section enabling questions between husband and wife as to property to be decided in a summary way. A judgment against a married woman under the Act is limited to execution against her separate property; she cannot like an ordinary debtor be commited to prison under the Debtor's Act for default in payment.

Criminal law.

Criminal Law.—There are some offences which can be committed only by women, others which can be committed only against them. Among the former are concealment of birth (in ninety-nine cases out of a hundred), the now obsolete offence of being a common scold, and prostitution and kindred offences. Many offences of the latter kind were up to a recent date dealt with under the Contagious Diseases Acts, which were repealed in 1886. Where a married woman commits a crime in company with her husband, she is generally presumed to have acted by his coercion,[6] and so to be entitled to acquittal. This presumption, however, was never made in witchcraft cases, and is not now made in cases of treason, murder, and other grave crimes, or in crimes in which the principal part must necessarily be taken by the wife, such as keeping a brothel. In fact the exceptions to the old presumption are now perhaps more numerous than those falling within it. The doctrine of coercion and the practice of separate acknowledgment of deeds by married women (necessary before the Married Women's Property Act) seem to be vestiges of the period when women, besides being chattels, were treated as chattels.[7] Formerly a wife could not steal her husband's property, but since the Married Women's Property Act this has become possible. The evidence of a wife is not usually receivable for or against her husband (see WITNESS). She does not become an accessory after the fact by receiving and harboring her husband after he has committed a felony; the husband, however, is not equally privileged if the offence be committed by the wife. Adultery is now no crime, England being almost the only country where such is the case. It was punished by fine in the ecclesiastical courts up to the 17th century, and was made criminal for a short time by an ordinance of the Long Parliament. The offences which can be committed only against women are chiefly those against decency, such as rape, procurement, and similar crimes, in which a considerable change in the law in the direction of increased protection to women was made by the Criminal Law Amendment Act, 1885. Another offence is abduction, which needs to be separately mentioned, as it appears in law to be an offence partly against the person, partly against property, for a difference is made between the abduction of a woman with property and of one without property. As to offences committed against a wife, recent legislation has made some considerable changes. By the Matrimonial Causes Act, 1878, if a husband be convicted of an aggravated assault upon his wife, the court before which he is tried may order (subject to an appeal to the Probate, Divorce, and Admiralty Division of the High Court) that the wife be no longer bound to cohabit with him, such order to have the effect of a judicial separation on the ground of cruelty. The order may also provide for payment of a weekly allowance by the husband to the wife and for the custody of the children of the marriage. That of the children under ten may be given to the wife. The Married Women's Property Act gives a married woman criminal remedies against all persons (including her husband) for the protection of her separate property, with a proviso that no such criminal proceedings shall be taken against a husband while they are living together, nor while they are living apart, concerning any act done while they were living together, unless the wife's property have been wrongfully taken by the husband on desertion of his wife. The section just cited extends the common law, under which the wife's redress for injuries committed by her husband was confined to injuries to the person. But it extends it only to injuries to the separate property, and it has recently been held that a wife cannot, under the terms of the section, proceed against her husband criminally for libel.[1] The Married Women (Maintenance in case of Desertion) Act, 1886, enables a wife to summon her husband before a court of summary jurisdiction for desertion, and the court may make an order for her support. Before the Act the wife's only course was to become chargeable to the parish, allowing the guardians to seek to recover from the husband the cost of her maintenance. The punishment of a woman may still be different from that of a man in TREASON (*q.v.*). Where whipping is allowed after conviction for robbery, or of juvenile offenders for larceny, it cannot be inflicted on females. Chastisement of a wife by a husband, possibly at one time lawful to a reasonable extent, would now certainly constitute an assault. The husband's rights are limited to restraining the wife's liberty in case of her misconduct.

---

[1] [By common law all the earnings of the wife during marriage, even if produced solely by her skill and labor, were her husband's.—AM. ED.]

[2] This was a rule of law, confirmed, though not for the first time established, by the well-known decision of Lord Thurlow in Countess of Strathmore *v.* Bowes, in 1789, to the effect that a secret conveyance by a woman during her engagement to her future husband might be set aside by him after marriage. A legal relation was in this case created by engagement or betrothal. The only other instance in English law in which betrothal gives any rights appears to be the action for breach of promise of marriage. In the Mosaic law betrothal was, for the purposes of punishment of adultery, equivalent to marriage (see Deut. xxii. 23). In some modern systems betrothal is a matter of more importance than it is in England. In Germany, for instance, it is publicly advertised.

[3] See *Re* Cameron and Wells, *Law Rep.*, 37 Chancery Div., 32.

[4] A brief sketch of the law relating to this branch of the subject has been added by way of appendix to this article.

[5] [In common law if she were injured in her person or her property she could bring no action for redress without her husband's concurrence and in his name as well as her own; she could not be sued without making her husband a defendant, except when she became in the eye of the law as an unmarried woman, either because of the banishment of her husband or his abjuring the realm.—AM. ED.]

[6] [Her impunity for such crimes on the presumption of her husband's coercion had its corollary in the husband's authority to restrain and control the wife with a stick not thicker, the learned judges ruled, than a man's little finger. The Massachusetts "Body of Liberties" (1641) "protected every married woman against bodily correction or stripes by her husband, and she had redress if at his death he should not leave her a competent portion of his estate." See Bancroft's *History of the United States*, vol. i. p. 284 (N. Y., 1886).—AM. ED.]

[7] It was certainly laid down by the Court of Chancery, in more than one case, that the reason for enforcing acknowledgment of deeds by a married woman apart from her husband was the presumption that in matters of property she was sure to be coerced by him. If such were the truth, the separate acknowledgment—a matter of a few minutes conversation—was but a poor safeguard. The doctrine of coercion in felonies is attributed by Mr. Justice Stephen to the wish to give women, while they had not benefit of clergy, the same chance of escape as men (see his *Digest of the Criminal Law*, App., note 1).

Scottish law.

Scotland.—As early as *Regiam Majestatem* (12th century) women were the object of special legal regulation. In that work the *mercheta mulieris* (probably a tax paid to the lord on the marriage of his tenant's daughter) was fixed at a sum differing according to the rank of the woman. Numerous ancient laws dealt with trade and sumptuary matters. By the *Leges Quatuor Burgorum* female brewsters making bad ale were to forfeit eightpence [4 cts.] and be put on the cucking-stool, and were to set an ale-wand outside their houses under a penalty of fourpence [2 cts.]. The same laws also provided that a married woman committing a trespass without her husband's knowledge might be chastised like a child under age. The *Statuta Gilde* of the 13th century enacted that a married woman might not buy wool in the streets or buy more than a limited amount of oats. The same code also ensured a provision for the daughter of one of the guild-brethren unable to provide for herself through poverty, either by marrying her or putting her in a convent. By the Act 1429, c. 9, wives were to be arrayed after the estate of their husbands. By 1457, c. 13, no woman was to go to church with her face covered so that she could not be known. 1581, c. 18, was conceived in a more liberal spirit, and allowed women to wear any head-dress to which they had been accustomed. 1621, c. 25, permitted servants to wear their mistress's cast-off clothes. 1681, c. 80, contained the remarkable provision that not more than two changes of raiment were to be made by a bride at her wedding. In its more modern aspect the law is in most respects similar to that of England. A woman may be queen or a peeress of Scotland.[2] In the old law she could not do homage, but only fealty, and she could not be arbiter, cautioner, or witness. A married woman could be warrantor of heritables only where her husband was under age and she was of full age. All disabilities of women as witnesses were removed by 31 and 32 Vict. c. 101, ‖ 139. A woman is still not receivable as cautioner for an executor-dative. Nor can she be tutor-at-law, but she may be appointed tutor by testament or by the court. While tests existed women were exempt from the test oath (see TEST ACTS). The Court of sessions decided in 1868 that the parliamentary suffrage was confined to males.[3] But, as in England, women possess votes in elections to school boards and to municipal and local bodies, the latter specially conferred by the Municipal Elections Amendment Act, 1881, and the General Police and Improvement Act, 1882. The right of married women to vote at school-board elections under the Education Act, 1872, appears to have caused some difficulty, and to have been differently decided in different counties. Women are not admitted to degrees by the Scottish universities, though several attempts have been made to confer upon them this privilege. At one time, indeed, they seem to have practiced medicine without qualification, for in 1641, in a ratification of the privileges of the Edinburgh chirurgeons, a complaint was recited that women practiced chirurgy without having learned the art. In 1873 the Court of Session decided that female students could not graduate in medicine at Edinburgh.[4] A bill to enable the universities to grant degrees to women was rejected in 1875. St. Andrews grants them not the ordinary degree but a special title of L.L.A.[5] The powers given by the Act of 1876 (39 and 40 Vict. c. 41) have recently been exercised in favor of women by the Colleges of Physicians and Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow. By the Educational Endowments Act, 1882, the benefits of endowments are to be extended as far as possible to both sexes. In 1881 the Married Women's Property Act (44 and 45 Vict. c. 21) made important extensions of the rights given to married women by the Act of 1877, for which see HUSBAND AND WIFE. A wife married after the date of the Act has a separate estate in movable and heritable property. A husband has the same rights in the movable estate of his deceased wife as a widow had before the Act in the estate of her deceased husband. Children have a right of legitim in their mother's movable estate. The criminal law differs slightly from that of England. At one time drowning was a punishment specially reserved for women. Incest or an attempt to commit incest is still punishable as a crime, and has been so punished within the last few years. Adultery and fornication are still nominally crimes under old Acts, but criminal proceedings in these cases have fallen into desuetude. The age of testamentary capacity is still twelve, not twenty-one, as in England.

Law in United States.

United States.—The Acts of Congress contain little affecting the subject. Any woman married to a citizen of the United States who might herself be lawfully naturalized is to be deemed a citizen. Women are allowed as clerks in Government departments, and may be employed as nurses and hospital matrons in the army. The right of voting for Congress or for the State legislatures is still denied in the country as a whole, in spite of the strong attempts which have been made by the advocates of female suffrage. The right, however, exists to a limited extent. In the Territories of Washington, Wyoming, and Utah women vote, and in the constitutions of some States, such as Colorado and Wisconsin, it is provided that the right of suffrage may be extended to women by a majority of electors at a general election. The constitutions of most States confine the parliamentary franchise to male electors. The admission of women to the school franchise is, however, largely increasing, and had in 1887 been adopted by fourteen States. In a limited number of States the professions (except the military) are open to women. Where the legal profession is not so open, a refusal by a State court to grant a license to practice law is no breach of the Federal constitution (see PRIVILEGE). In most States the policy adopted in England by the Married Women's Property Act is the rule, and there is in general no distinction of sex in succession to real estate. For the testamentary rights of married women see WILL. In some of the State universities women are admitted to the full privileges of instruction and graduation. In others, such as the university of Pennsylvania, they are admitted to instruction and examination, but not to graduation. The law in some cases gives women remedies for tort which are unknown in England. For instance, by the law of some States a woman may bring an action of SEDUCTION (*q.v.*) in her own name, and may recover damages for slander imputing unchastity, without proof of special damage, which cannot be done in England. The criminal law is also more extensive. In the New England and some of the other States mere fornication is punishable as a crime. Adultery is criminal by the law of most States.

Literature.—Besides those already cited, the following authorities may be consulted. For the general law Montesquieu, *Esprit des Lois*, bk. vii.; Laboulaye, *Recherches sur la Condition Civile et Politique des Femmes*, 1843; Thos. Wright, *Womankind in Western Europe*, 1869; Sheldon Amos, *Difference of Sex as a Topic of Jurisprudence and Legislation*, 1870; Paul Gide, *Étude sur la Condition Privée de la Femme*, 1885; Ernest Naville, "La Condition Sociale des Femmes," in the *Bibliothèque Universelle et Revue Suisse*, for Oct., Nov., and Dec., 1887. For old English law, *The Law's Resolutions of Women's Rights*, 1632; *The Lady's Law*, 1737; *The Laws Respecting Women*, 1777 (these three works are anonymous); C. S. Kenny, *Hist. of the Law of England as to the Effects of Marriage on Property and on the Wife's Legal Capacity*, 1879. For modern English law, T. Barrett-Lennard, *The Position in Law of Women*, 1883; R. Thicknesse, *Digest of the Law of Husband and Wife*, 1884; Wolstenholme and Turner, *Conveyancing Acts* (4th ed.), 1885; W. P. Eversley, *Law of the Domestic Relations*, 1885; Félix Remo, *L'Égalité des Sexes en Angleterre*, 1886.

[2] The rule of succession to Scottish peerages is different from that regulating the succession to English peerages by writ. In case of the death of a peer leaving several daughters and no son, the English peerage would fall into abeyance among the daughters, but the eldest daughter would succeed to the Scottish peerage. In the peerage law of Scotland there was no presumption that a peerage was limited to males, and the more ancient peerages were often held by females or their husbands in their right.

Breach of promise.

Breach of Promise of Marriage.—The action for breach of promise of marriage is in some of its incidents peculiar to English law. In Roman law, betrothal (*sponsalia*) imposed a duty on the betrothed to become husband and wife within a reasonable time, subject to the termination of the obligation by death, repudiation by the words *conditione tua non utor*, or lapse of time, the time fixed being two years. No action lay for breach of promise to marry unless *arrhæ sponsalitiæ* had been given, *i.e.*, earnest of the bargain, to be forfeited by the party refusing to carry it out. The *arrha* might also be given by a parent, and was equally liable to forfeiture. A provincial governor, or one of his relations or household, could not recover any *arrha* that might have been given, it being supposed that he was in a position of authority and able to exercise influence in forcing consent to a betrothal.

In the canon law breach of the promise made by the *sponsalia*, whether *de præsenti* or *de futuro*, a division unknown to Roman law, does not without more appear to have sufficed to found an action for its breach, except so far as it fell under ecclesiastical cognizance as *læsio fidei*, but it had the more serious legal effect of avoiding as a canonical disability the subsequent marriage, while the original *sponsalia* continued, of a betrothed person to any other than the one to whom he or she was originally betrothed. The *sponsalia* became inoperative, either by mutual consent or by certain supervening impediments, such as ordination or a vow of chastity. The canonical disability of pre-contract was removed in England by 32 Hen. VIII. c. 38, re-established in the reign of Edward VI., and finally abolished in 1753.

In England the duty of the parties is the same as in Roman law, viz., to carry out the contract within a reasonable time, if no time be specially fixed. Formerly a contract to marry could be specifically enforced by the ecclesiastical court compelling a celebration of the marriage *in facie ecclesiæ*. The last instance of a suit for this purpose was in 1752, and the right to bring it was abolished in 1753 by Lord Hardwicke's Act (26 Geo. II. c. 33). The action for breach of promise may be brought by a man or a woman, though the former case has been of rare occurrence, and a male plaintiff has still more rarely been rewarded with anything more than nominal damages. It may be brought by but not against an infant, and not against an adult if he or she has merely ratified a promise made during infancy; it may be brought against but not by a married man or woman (in spite of the inherent incapacity of such a person to have married the plaintiff), and neither by nor against the personal representatives of a deceased party to the promise (unless where special damage has accrued to the personal estate of the deceased). The promise need not be in writing. The parties to an action are by 32 and 33 Vict. c. 68 competent witnesses; the plaintiff cannot, however, recover a verdict without his or her testimony being corroborated by other material evidence. The measure of damages is to a greater extent than in most actions at the discretion of the jury; they may take into consideration the injury to the plaintiff's feelings, especially if the breach of promise be aggravated by seduction. Either party has a right to trial by jury under the rules of the Supreme Court, 1883. The action cannot be tried in a county court, unless by consent, or unless remitted for trial there by the High Court. Unchastity of the plaintiff unknown to the defendant when the promise was made and dissolution of the contract by mutual consent are the principal defences which are usually raised to the action. Bodily infirmity of the defendant is no defence to the action, though it may justify the other party in refusing to marry the person thus affected. Where the betrothed are within prohibited degrees of consanguinity or affinity, there can be no valid promise at all, and so no action for its breach.

In Scotland a promise in the nature of *sponsalia de futuro* not followed by consummation may be resiled from, subject to the liability of the party in fault to an action for the breach, which by 6 Geo. IV. c. 120, s. 28, is a proper cause for trial by jury. If, however, the *sponsalia* be *de præsenti*, and, according to the more probable opinion, if they be *de futuro* followed by consummation, a pre-contract is constituted, giving a right to a decree of declarator of marriage and equivalent to marriage, unless declared void during the lifetime of the parties.

In the United States the law is in general accordance with that of England. The statute law of California and Dakota provides that the unchastity of one party of which the other is ignorant is a good defence but it is no defence if both participate therein. (J. W.)

WOOD. See BOTANY, vol. iv. p. 89; BUILDING, FORESTS, STRENGTH OF MATERIALS; also FIR, OAK, PINE, TEAK, etc.

WOOD, ANTHONY À[1] (1632–1695), antiquary, was the fourth son of Thomas Wood (1580–1643), B.C.L. of Oxford, where Anthony was born 17th December, 1632. He was sent to New College school in that city in 1641, and at the age of twelve was removed to the free grammar school at Thame, where his studies were interrupted by civil war skirmishes. He was then placed under the tuition of his brother Edward (1627–55), of Trinity College; "while he continued in this condition his mother would alwaies be soliciting him to be an apprentice which he could never endure to heare of" (*Life*, 1848, p. 33). He was entered at Merton College in 1647, and made postmaster. In 1652 "he began to exercise his natural and insatiable genie he had to musick" (*ibid.*, 53), and was examined for the degree of B.A. He engaged a music-master, and obtained permission to use the Bodleian, "which he took to be the happiness of his life." He was admitted M.A. in 1655, and in the following year published a volume of sermons of his late brother Edward. Dugdale's *Warwickshire* came into his hands, and he describes how "his tender affections and insatiable desire of knowledge were ravished and melted downe by the reading of that book. What by musick and rare books that he found in the public library, his life, at this time and after, was a perfect Elysium" (*ibid.*, p. 68). He now began systematically to copy monumental inscriptions and to search for antiquities in the city and neighborhood. He went through the Christ Church registers, "at this time being resolved to set himself to the study of antiquities." Dr. John Wallis, the keeper, allowed him free access to the university registers in 1660; "here he layd the foundation of that book which fourteen years afterwards he published, viz., *Hist. et Antiq. Univ. Oxon.*" He steadily investigated the muniments of all the colleges, and in 1667 made his first journey to London, where he visited Dugdale, who introduced him into the Cottonian library, and Prynne showed him the same civility for the Tower records. On October 22, 1669, he was sent for by the delegates of the press, "that whereas he had taken a great deal of paines in writing the *Hist. and Antiq. of the Universitie of Oxon*, they would for his paines give him an 100 *li.* [$581.12] for his copie, conditionally, that he would suffer the book to be translated into Latine" (*ibid.*, 167). He accepted the offer and set to work to prepare his English MS. for the translators, Richard Peers and Richard Reeve, both appointed by Dr. Fell, dean of Christ Church, who undertook the expense of printing. The translation was supervised by Fell, with whom and the translators Wood had endless quarrels about alterations of his text. In 1674 appeared *Historia et Antiquitates Universitatis Oxoniensis*, handsomely printed "e Theatro Sheldoniano," in two folio volumes, the first devoted to the university in general and the second to the colleges. Copies were widely distributed, and university and author received much praise. On the other hand, Bishop Barlow told a correspondent that "not only the Latine but the history itself is in many things ridiculously false" (*Genuine Remains*, 1693, p. 183). In 1678 the university registers which had been in his custody for eighteen years were removed, as it was feared that he would be implicated in the Popish Plot. To relieve himself from suspicion he took the oath of supremacy and allegiance. During this time he had been gradually completing his great work, which was produced by a London publisher in 1691–92, 2 vols. folio, *Athenæ Oxonienses: an Exact History of all the Writers and Bishops who have had their Education in the University of Oxford from* 1500 *to* 1690, *to which are added the Fasti, or Annals for the said time.* On 29th July, 1693, he was condemned in the vice-chancellor's court for certain libels against the late earl of Clarendon, fined, banished from the university until he recanted, and the book burnt. The proceedings were printed in a volume of *Miscellanies* published by Curll in 1714. Wood was attacked by Bishop Burnet in a *Letter to the Bishop of Lichfield and Coventry*, 1693, 4to, and defended by his nephew Dr. Thomas Wood, in a *Vindication of the Historiographer, to which is added the Historiographer's Answer*, 1693, 4to, reproduced in the subsequent editions of the *Athenæ*. The nephew also defended his uncle in *An Appendix to the Life of Bishop Seth Ward*, 1697, 8vo. On 9th October, 1695, Wood had an interview with the earl of Clarendon, but was not able to get his fine remitted. After a short illness he died 28th November, 1695, in his sixty-third year, and was buried in the ante-chapel of St. John Baptist (Merton College), in Oxford, where he superintended the digging of his own grave but a few days before.

---

[1] In the *Life* he speaks of himself and his family as Wood and not à Wood, a pedantic return to old usage adopted by himself. A pedigree is given in Bliss's edition, 1848, p. 357.

He is described as "a very strong lusty man," of uncouth manners and appearance, not so deaf as he pretended, of reserved and temperate habits, not avaricious, and a despiser of honors. He received neither office nor reward from the university, which owed so much to his labors. He never married, and led a life of self-denial, entirely devoted to antiquarian research. Bell-ringing and music were his chief relaxations. His literary style is poor, and his taste and judgment are frequently warped by prejudice, but his two great works and unpublished collections form a priceless source of information on Oxford and her worthies. He was always suspected of being a Roman Catholic, and invariably treated Jacobites and Papists better than Dissenters in the *Athenæ*, but he died in communion with the Church of England.

Wood's original manuscript (purchased by the Bodleian in 1846), was first published by John Gutch, as *The History and Antiquities of the Colleges and Halls in the University of Oxford, with a continuation*, 1786–90, 2 vols. 4to, and *The History and Antiquities of the University of Oxford*, 1792–96, 3 vols. 4to, with portrait of Wood. To these should be added *The Antient and Present State of the City of Oxford, chiefly collected by A. à Wood, with additions by Sir J. Peshall*, 1773, 4to. A new edition is in preparation by the Oxford Historical Society. *Modius Salium, a Collection of Pieces of Humor*, chiefly ill-natured personal stories, was published at Oxford in 1751, 12mo. Some letters between Aubrey and Wood were given in the *Gentleman's Magazine* (3d ser., ix., x., xi.). Wood consulted Dr. Hudson about getting a third volume of the *Athenæ* printed in Holland, saying, "When this volume comes out I'll make you laugh" (*Reliq. Hearnianæ*, i. 59). This was included in a second edition of the *Athenæ* published by Tonson in 1721, 2 vols. folio, "very much corrected and enlarged, with the addition of above 500 new lives." The third appeared as "a new edition, with additions, and a continuation by Philip Bliss," 1813-20, 4 vols. 4to. The Ecclesiastical History Society proposed to bring out a fourth edition, which stopped at the *Life*, ed. by Bliss, 1848, 8vo (see *Gent. Mag.*, N.S., xxix. 135, 268). Dr. Bliss's interleaved copy is in the Bodleian, and Dr. Griffiths announced in 1859 that a new edition was contemplated by the Press, and asked for additional matter (see *Notes and Queries*) 2d ser., vii. 514, and 6th ser., vi. 5, 51). Wood bequeathed his library (127 MSS. and 970 printed books) to the Ashmolean Museum, and the keeper, William Huddesford, printed a catalogue of the MSS. in 1761. In 1860 the whole collection was transferred to the Bodleian, where 25 volumes of Wood's MSS. had been since 1690. Many of the original papers from which the *Athenæ* was written, as well as several large volumes of Wood's correspondence and all his diaries, are in the Bodleian.

The chief authority is the *Life* of Wood written by himself, and first published by Hearne in the appendix to T. Caii *Vindiciæ*, 1730; the memoirs after 1672 were compiled by Rawlinson from the original diaries, and printed by Huddesford with the *Lives* of Leland and Hearne, 1772, 2 vols. 8vo. A new edition was issued by Bliss, 1848. See also *Reliquiæ Hearnianæ*, ed. Bliss, 2d ed., 1869, 3 vols. 12mo; Hearne's *Remarks and Collections* (Oxford Hist. Soc., 1885, etc.); Macray's *Annals of the Bodleian Library*, 1868; Nichols's *Literary Anecdotes*, i., iv., v., viii.; Noble's *Biogr. History of England*, i. (H. R. T.)

WOOD, Mrs. Henry (1814–1887), novelist, was born on the 17th January, 1814. Her maiden name was Ellen Price; her father was a glove manufacturer in Worcester—the original of the cathedral city which, with its church dignitaries and schools, is the scene of so many of her tales. From certain vague memoirs published by her son in the *Argosy*[1] (of which her novels were the mainstay for the last twenty years of her life) it appears that the industrial distress described in *Mildred Arkell* is a reminiscence of the collapse of the glove trade in Worcester, consequent on Huskisson's tariff reforms in 1823, from which her father suffered along with other English glove manufacturers. She married young, it is said, and after her marriage lived for the most part in France, her husband being "at the head of a large shipping and banking firm abroad." She first came before the public in her own name as the author of a temperance tale (*Danesbury House*), which had gained the prize of £100 [$486] offered by the Scottish Temperance League. This was in 1860; but it appears from the memoirs already referred to that "for many years" before this she had been a regular contributor of stories anonymously, month after month, to Mr. Harrison Ainsworth's magazines, Bentley's *Miscellany*, and Colburn's *New Monthly*. *Danesbury House* was very favorably reviewed, her genuine gifts as a story-teller making themselves apparent in spite of the didactic purpose of the tale; but Mrs. Wood's first great success was made in the following year with *East Lynne*, one of the most popular novels of the century. A long review in the *Times*, in which a place was claimed for her in the foremost rank of novelists, was the loudest note in a general chorus of praise, and fairly established her position. The praise of the critics continued throughout the next half-dozen of her novels, which followed one another with great rapidity: *The Channings* and *Mrs. Halliburton's Troubles*, in 1862; *Verner's Pride* and *The Shadow of Ashlydyat*, in 1863; *Lord Oakburn's Daughters*, *Oswald Cray*, and *Trevlyn Hold*, in 1864. These works were held to confirm the promise of *East Lynne*, and *The Shadow of Ashlydyat* was pronounced to be (as it is still generally considered) the best of them all. Complaints of sameness,—almost inevitable, considering the rate of production,—of commonplaceness of sentiment and material, and of a certain narrowness and insufficiency in her conceptions of poetical justice first began to be heard in connection with *Mildred Arkell* (1865), and became louder as the fertile novelist continued to pour forth her stories with inexhaustible fluency. She became owner of the *Argosy* in 1867, and her stories quickly raised it to an enormous circulation. She had a certain triumph over her critics with the *Johnny Ludlow* tales, an imitation of Miss Mitford's *Tales of Our Village*. Mrs. Wood's name was not put to them as they appeared in the *Argosy*, and when the first series was collected and published separately in 1874 they excited among reviewers an approach to the enthusiasm with which her first efforts had been welcomed. Undoubtedly Mrs. Wood possessed many of the qualities of a first-rate story-teller,—great simplicity of style, unfailing fluency, a lively interest in prominent traits of character, abundant circumstantiality, skill in exciting curiosity and keeping up suspense, and withal a wonderful clearness of method. Amidst her crowd of characters and incidents you are never puzzled or perplexed, and she very rarely lapses into tediousness. If ever she is tedious it is from repeating herself. Her "criticism of life" is not very broad or very profound, though it is generally for moral edification; she is simply an excellent story-teller out of the ordinary materials of the craft. In private life Mrs. Wood seems to have been a most amiable person: her son gives a very lovable picture of her. Her death took place on 10th February, 1887, at the age of seventy-three. She was active in her work till the very last, and left several completed stories, short and long, ready for publication.

WOOD-CARVING. In most countries, during the early development of the plastic art, sculpture in wood took a very important position, and was much used for statues on a large scale, as well as for small works decorated with surface carving. On the whole, wood is much more suitable for carving in slight relief than for sculpture in the round, and its special structure, with bundles of long fibres, strong in one direction and weak in another, make it very necessary for the carver to suit his design to the exigencies of the material. Large curves should be avoided, on account of their tendency to split across with the grain, and deep under-cutting is objectionable for the same reason. A tough fibrous substance like wood obviously calls for a very different treatment from that which is suitable to a homogeneous substance like stone or marble. This adaptation of the design to the material is very conspicuous in the wood-carving of the finest kinds, such as the Scandinavian doorways of the 9th to the 12th centuries, the Perpendicular roofs and screens of England in the 15th century, and the richly carved panelling of Moslem countries throughout the Middle Ages.

---

[1] See "Mrs. Henry Wood, *In Memoriam*," *Argosy*, vol. xliii., 1887.

Some woods, such as pear, lime, and more especially box, are comparatively free from any distinct grain, and may be carved almost like marble, but these woods are only to be had in small pieces, and from their want of fibre are structurally weak, and are therefore only available for decorative purposes on a small scale. It is this absence of grain which makes boxwood the material selected for engraving on wood, a form of wood-carving in which the artist needs to be as little as possible hampered by the structure of his material. In ancient times cedar wood was specially used for decorative carving, and in the East various perfumed woods, such as that of the sandal-tree, have always been favorites with the carver. In Europe the oak, the chestnut,[1] the fir, and the walnut have been chiefly used, and for sculpture in the round or high relief the sycamore and the plane tree, as well as the oak.

One objection to using wood for life-sized or colossal sculpture is that large blocks are very liable to crack and split from end to end, owing to the fact that the parts near the surface dry and shrink more rapidly than the core. For this reason the mediæval carvers usually hollowed out their wooden statues from the back, so as to equalize the shrinkage and prevent splitting. In all cases wood for carving should be very well seasoned, and it is especially necessary to get rid of the natural sap, which causes rot if it is not dried out. It is useful to soak newly cut timber in running water, so that the sap may be washed away; it is then comparatively easy to dry out the water which has soaked into the pores of the wood and taken the place of the sap.

Egyptian.—One of the most remarkable examples of ancient Egyptian art, dating probably from nearly 4000 years B.C., is a life-sized portrait statue of a stout elderly man, now in the Boulak museum. This is carved out of a solid block of sycamore wood, except that the right arm is worked separately and attached by a mortice and tenon; the eyes are formed by inlaid bits of shell and crystal, and the whole is a most wonderful piece of life-like realism (see Fig. 1). Although dating from so remote a period, this statue bears witness to an amount of technical skill and artistic knowledge which shows that long centuries of experience and artistic development must have preceded its production,—a period of which we have no remains, this statue being one of the earliest works of art which even Egypt has preserved for us. In the same museum are also some very remarkable wooden panels from the tomb of Hosi, about four feet high, carved in low relief with standing figures of men and hieroglyphs. These large slabs of wood formed part of the wall lining of the tomb. The reliefs are executed with the utmost spirit and extreme delicacy of treatment, and are highly decorative in style; they show, moreover, a keen sense of the special treatment suitable to the material in which they are carved. These also date from nearly 4000 B.C. After the early dynasties in Egypt wood does not seem to have been used for sculpture on a large scale, although it was very commonly employed for mummy cases or coffins, one end carved with a human face and the rest almost plain, except for its elaborate painted ornaments in gold and colors, applied on a thin coat of stucco laid evenly over the wood. A large number of smaller examples of Egyptian wood-carving exist in various museums, such as furniture, boxes, implements for the toilet, and the like, frequently decorated with slight surface reliefs of animals or plants, and graceful patterns formed of the lotus or papyrus flower treated with great decorative skill.

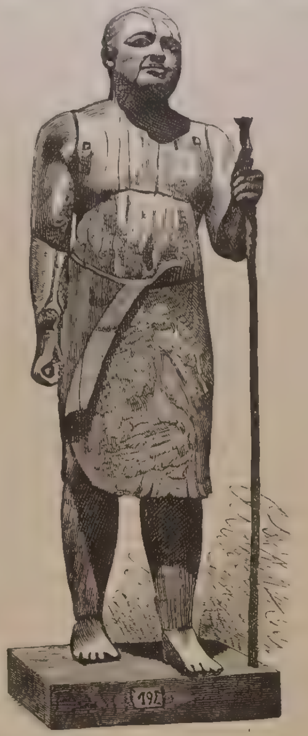

FIG. 1.—Life-sized Portrait Statue from a Tomb of the Fourth Dynasty.

Greek.—Owing to the perishable nature of the material, almost the only ancient examples of wood-carving which have survived to our time are those from the tombs of Egypt.[2] The many important pieces of wooden sculpture which once existed in Greece and other ancient countries are only known to us by the descriptions of Pausanias and various classical writers. It is probable that the earliest examples of the plastic art among the Hellenic race were the rude wooden images of the gods (*ξόανα*), of which many examples were preserved down to late historic times. The art of sculpture, and especially sculpture in wood, is probably older than that of painting, as it requires less artistic knowledge to rudely fashion a log of wood into a rough body with rounded head, two holes for the eyes and slits for the mouth and nose, than to conceive mentally and set down on a plane surface any attempt even at the rudest outline drawing,—a process which requires a distinct act of abstraction and some notion of treating the subject in a conventionally symbolic way. Real things have of course no enclosing line, and the representation of an object in outline conveys little or no idea to the mind of a man who is yet in a very early stage of culture. The Palladium, or sacred figure of Pallas, which was guarded by the vestal virgins in Rome, and which was fabled to have been brought by Æneas from the burning Troy, was one of these wooden *ξόανα* (see VESTA). A wooden figure of the Armed Aphrodite at Cythera is mentioned by Pausanias, iii. 23, 1. Of the same kind was the wooden statue of Hermes in the shrine of Athene Polias on the Acropolis of Athens, said to have been the offering of Cecrops (Pausan., i. 27, 1); and the figure of Athene Polias itself was an ancient wooden *ξόανον*. Another very ancient statue, carved out of cedar wood, was the statue of Apollo in his temple, dedicated 428 B.C., in the Campus Martius of Rome; this statue was called Apollo Sosianus, from Sosius the præfect of Syria, who presented it to the temple (Pliny, *H. N.*, xiii. 5 and xxxvi. 4). Pausanias (ii. 24) mentions another early wooden statue at Argos,—that of Zeus Larissæus, which was remarkable for having three eyes. A very elaborate example of cedar-wood carving enriched with gold and ivory is described by Pausanias (v. 17 to 19). This was a coffer dedicated at Olympia by the children of Cypselus, tyrant of Corinth in the 7th century B.C. It was decorated with bands in relief, with scenes from the lives of various gods and heroes. A cedar box, with two carved dogs attached to it, was found at Mycenæ by Dr. Schliemann, and is now in the museum at Athens. During the most flourishing period of Greek art wood was sometimes used for important plastic purposes, as, for example, the colossal statue of Athene at Platæa, carved by Phidias. The figure was of gilt or plated wood, with the exception of the nude parts,—the face, hands, and feet,—which were of Pentelic marble.

---

[1] In many cases it is almost impossible to distinguish between chestnut and oak, especially in the mediæval roofs of England.

[2] Acacia and sycamore wood were chiefly used for the larger wood sculpture of Egypt. A wooden coffin, covered with fine Greek paintings of *c.* 300 B.C., was discovered in a tomb at Panticapæum (Kertch), and is now in the museum at St. Petersburg.

Roman.—Of the wood-carving of the Roman period almost no important examples now exist; but the carved panels of the main doors of S. Sabina on the Aventine Hill are very interesting specimens of wooden relief-sculpture of early Christian times, dating, as the costumes show, from the 5th century. The doors are made up of a large number of small square panels, each minutely carved with a scene from the Old or New Testament; the whole feeling of these reliefs is thoroughly classical, though of course in a very debased form.

Mediæval.—The most remarkable examples of early mediæval wood-carving are the doorways of wooden churches of Scandinavia and Denmark, dating from the 9th to the 13th centuries. These are framed with great planks or slabs of pine wood, the whole surface of which is covered with rich and intricate patterns of interlacing scroll-work, mixed with figures of dragons and serpents, designed with extraordinary wealth of invention, and of the highest decorative value. The relief is very low, except where occasionally a monster's head projects from the general level; and yet the utmost vigor of effect is gained by the grand sweeping curves of the leading lines. These are masterpieces of wood-carving, designed and executed with the most perfect sense of the necessities of the material. Fig. 2 shows part of the architrave of a door from Aal church, Norway, dating from the 12th century. Unhappily almost the last of these interesting wooden churches have been destroyed in recent years, and merely the wrecks of their grand wooden sculpture have been occasionally preserved in some museum; some very valuable casts of these are in the South Kensington Museum.

English.—For various ecclesiastical purposes a large amount of important sculpture in wood was produced in Britain throughout the Middle Ages. At the time of the Reformation every church had its rood-screen, surmounted by a large crucifix between two standing figures of St. Mary and St. John. These were of wood, except perhaps in some of the richest cathedral or abbey churches, which occasionally had the rood made of silver. A very large number of churches also had retables over the various altars, with reliefs carved in wood and decorated with gold and colors. Many examples of this class still exist in Germany and Spain, but almost all the English examples perished under the iconoclasm of the Reformation.[1]

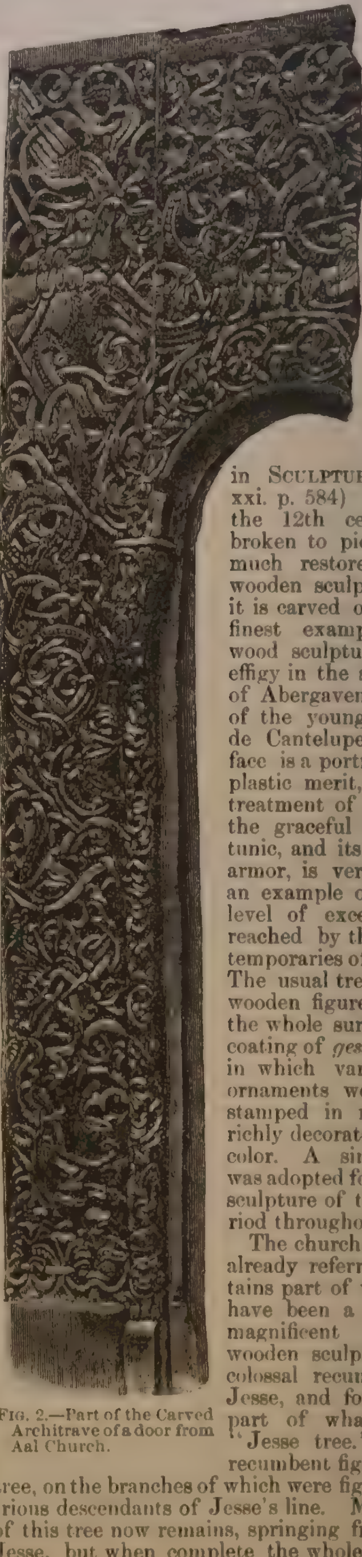

FIG. 2.—Part of the Carved Architrave of a door from Aal Church.

Another important class of wood-carving was that of large recumbent effigies from tombs, of which a good many examples still exist. One of the earliest is that of Robert, duke of Normandy, in Gloucester cathedral, illustrated in SCULPTURE, Fig. 5 (vol. xxi. p. 584) It is a work of the 12th century, but was broken to pieces, and is now much restored. Like most wooden sculpture in England, it is carved out of oak. The finest example of English wood sculpture is a life-sized effigy in the south choir aisle of Abergavenny church, that of the young knight George de Cantelupe (d. 1273). The face is a portrait of very high plastic merit, and the whole treatment of the figure, with the graceful drapery of its tunic, and its carefully carved armor, is very remarkable as an example of the very high level of excellence that was reached by the English contemporaries of Niccola Pisano. The usual treatment of these wooden figures was to cover the whole surface with a thin coating of *gesso* or fine stucco, in which various details or ornaments were modelled or stamped in relief, and then richly decorated with gold and color. A similar treatment was adopted for all the wooden sculpture of the mediæval period throughout Europe.

The church at Abergavenny already referred to, also contains part of what once must have been a very large and magnificent example of wooden sculpture. This is a colossal recumbent figure of Jesse, and formed the lower part of what was called a "Jesse tree." Out of the recumbent figure grew a great tree, on the branches of which were figures of the illustrious descendants of Jesse's line. Merely the stump of this tree now remains, springing from the side of Jesse, but when complete the whole tree must have reached high up towards the roof, with its network of branches forming a sort of screen behind the high altar—very rich and magnificent in effect, when the whole was perfect with its brilliant colored decoration, and the stained glass of the large east window seen dimly through the open branches of the tree. The existing figure of Jesse, which is 10 feet long, is cut out of a solid block of oak; a figure of an angel at the head is worked out of the same piece of wood.[1]

---

[1] Only three English examples of the figure of Christ on the rood are now known to exist. One of these was recently found built up in the rood-staircase of a small church in Wales. It is a work of the 14th century, carved roughly, but with much spirit.

Another very important application of wood-carving was for the decoration of the church stalls, screens, and roofs, which in the 15th century in England reached so high a pitch of splendor. The development of architectural wood-carving was much slower than that of sculpture in stone. During the "Early English" period wood-work was rather heavy in style and coarse in detail; in "Decorative" times wood-work of much beauty and richness was produced, but forms more suitable to stone were still used, and it was not till the later "Perpendicular" period in the 15th century, that the wood-carvers of England learnt to perfectly adapt their designs to the nature of their material. Very beautiful roofs, for example, were produced in the 14th century, such as that at Adderbury,[2] but the principals are frequently constructed with large arched braces, richly moulded and very graceful in effect but constructionally weak, and very wasteful of the material. Enormous balks of oak were required to enable the large curves of the braces to be cut out of the solid. The builders of the 15th century corrected these defects, and designed their sumptuous screens, stall-canopies, and open roofs with straight lines for the leading frame-work,—only using curves on a smaller scale, and in places where much strain does not fall upon them. Nothing can exceed the beauty, in its own class, of the 15th and early 16th century wood-work in England; the many fine examples that still exist give us some notion of the wealth of the country in this branch of art at a time when every church was obliged by canon law to have its rood-screen, and almost always also possessed carved oak-stalls and many other fittings, such as statues and retables, in the same material.[3]

The rich oak work of England was no exception to the universal application of colored decorations, and nearly every screen, roof, or choir-stall was covered with minute painting in gold and colors. The modern notion that oak should be left unpainted was quite unknown to our mediæval forefathers; and they, as a rule, preferred even a simple coating of white, red, or other color to the natural tint of the oak, which would have looked very dull and heavy in tone when surrounded by the polychromatic brilliance of the floor, the walls, and the windows. In most cases, however, the wood-work was not left with its uniform ground of paint; delicate and graceful patterns of diapers or sprigs of foliage were added on to all the main lines of the work, and covered the chief members of all the mouldings, in exactly the same way as was done with the sculpture in stone. Many of the Norfolk screens still have much of their painted ornament in good preservation[4]; and additional richness was gained by the groundwork of delicately moulded stucco with which the whole surface of the wood was covered before the coloring and gilding were applied. Modern "restorers" have in most cases scraped off all that remained of this brilliant decoration, and frequently no signs are now visible of this universal system of decoration. The very rich and graceful "watching gallery"[5] in the abbey church of St. Albans is now bare of any coloring, though it was once a very brilliant example of polychromatic decoration.

Great richness of carving is lavished on the church roofs, especially of Norfolk and Suffolk. Carved bosses cover the intersections of the moulded timbers, some with bunches of delicate foliage, others carved into figures of angels with outspread wings. Other statuettes of angels often cover the ends of the hammer-beams, and the whole cornice frequently has running foliage inserted in a hollow of the moulding. All this wood-carving is usually of very high artistic merit, and combines delicacy of detail with strength of decorative effect in a way that has never been surpassed by the mediæval artists of any country of the Continent. These magnificent roofs, which are peculiar to England, and even to certain districts such as East Anglia, are among the most perfect artistic productions of the Middle Ages.[6]

Norfolk, Suffolk, Devonshire, and other counties are still rich in elaborate chancel screens, carved with delicate foliage, especially in the hollows of the cornice, and light open cresting or "brattishing" along the top. The tracery which fills in the upper part of these screens is of wonderful beauty, and executed with the most minute finish and delicate moulding. The ends of the 15th-century stalls were often richly decorated with carving, and are crowned with finials, or "poppy-heads" of the most elaborate and spirited design. The underside of the "misericords"[7] of the monastic stalls were especially selected for minute enrichment, in spite of their very inconspicuous position. The utmost wealth of fancy and minuteness of workmanship is often lavished upon these, and their reliefs are frequently works of art of a very high order. In some cases the carver took his design from contemporary engravings by some distinguished German or Flemish artist, such as Schongauer or Albert Dürer. One of these in the chapel of Henry VII. at Westminster, representing "The Golden Age," is a work of wonderful beauty and delicacy of touch. Genre and satirical subjects are often selected; the regulars are made fun of in the churches of the secular clergy, and the vices of the secular priests are satirized on the stalls of the monastic churches. This satire is often carried to the verge of indecency, especially in the scenes frequently selected by clerical carvers to set forth the miseries of the married state.

In England during the 16th and 17th centuries little wood-carving of much merit was produced; the oak panelling furniture, and other fittings of the Elizabethan and Jacobean periods were largely enriched with surface reliefs, coarse in execution, but often decorative in effect, and chiefly remarkable for their showy appearance produced with the minimum of labor,[8] a great contrast to the rich detail and exquisite finish of the pre-Reformation work. Towards the end of the 17th century a very realistic style of wood-carving came into use, in which great technical skill was displayed but little real artistic feeling. Grinling Gibbons (1648–1721) and his pupils produced the most elaborate works of this class, such as wreaths, scrolls, and friezes carved in high relief, or in the round, with fruit and flowers modelled and carved with wonderful imitative skill, but weak in true decorative effect. These clever groups of foliage and fruit were carved in pear or lime wood, and fastened on to the surface of wall-panels, mantelpieces, and other wooden fittings. The stalls and screens in St. Paul's Cathedral are some of Gibbon's best works, and a great deal of his realistic carving still exists at Oxford in Trinity College, at Trinity College, Cambridge, at Chatsworth, at Petworth, and in many of the great country houses of that time. Since then wood-carving has not taken an important position among the lesser arts of the country.

---

[1] See a valuable monograph on the church of Abergavenny by Octavius Morgan, published by the Cambrian Archæological Society. For an account of other wooden effigies, see *Arch. Jour.*, xi. p. 149; and on existing rood figures, a paper by J. T. Micklethwaite in the *Proc. Soc. Ant.* for 1886, p. 127.

[2] The roof of Westminster Hall, of the early part of the 15th century is in size and richness of detail the most magnificent open timber roof in the world. It has carved braces of very wide span, cut out of enormous balks of oak or chestnut.

[3] It should be noted that in Old English the word "picture" was often used for a statue or a relief, partly no doubt from the fact that all sculpture was decorated with painting.

[4] See Talbot Bury, *Ecclesiastical Wood-Work*, London, 1847.

[5] So called because from it a guardian used constantly to watch, day and night, the great gold shrine of St. Alban, with its treasure of precious offerings all round it.

[6] A number of fine examples are well illustrated by Brandon, *Open Timber Roofs*, London, 1856.

[7] Often wrongly called "misereres."

Italian.—During the mediæval period wood was often used by the greatest sculptors of Italy, especially for crucifixes and statues of saints for ecclesiastical purposes. Fig. 3 shows a magnificent example of the school of Nino Pisano, dating from about the middle of the 14th century. It is a colossal figure of the Angel of the Annunciation, said to have once belonged to Pisa cathedral, and now one of the chief treasures of the South Kensington Museum. It is very remarkable for the delicate beauty of the face, and for the sculpturesque simplicity of the folds of the drapery. The original wings were probably much larger than the present ones, which are restorations.

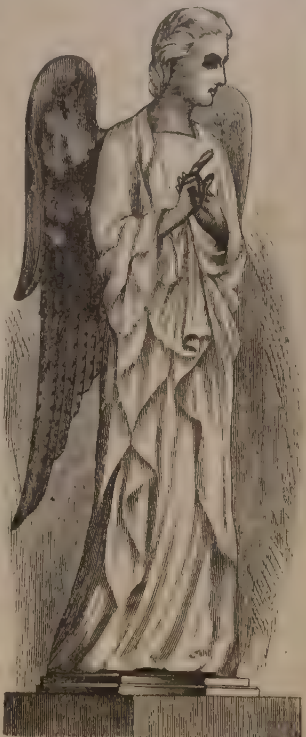

FIG. 3.—Colossal Statue of an Angel in the South Kensington Museum.

Many fine roods or crucifixes of life size still exist in the churches of Italy. One attributed to Donatello is preserved at Florence, in the church of S. Croce; another by Brunelleschi still exists. Nothing like the magnificent oak open roofs and choir screens of England were made in Italy. The latter were usually of marble or of metal, and the roofs were of the plain king-post construction, usually concealed by vaulted or panelled ceilings. Towards the end of the 15th century, and especially in the first half of the 16th, wood-carving of the most elaborate and magnificent sort was largely used to decorate church stalls, wall-panelling, doors, and the like. A very important school of this branch of art was founded by Raphael, whose designs were used or adapted by a large number of very skilful wood-carvers. The shutters of "Raphael's Stanze" in the Vatican and the choir stalls of the church of S. Pietro de' Cassinesi at Perugia are among the most beautiful examples of this class of carving.[1] The work is in slight relief, carved in walnut with the graceful arabesque patterns which Raphael developed out of the newly discovered remains of ancient Roman wall-painting from the palace of Nero and other places.[2] Fig. 4 shows a panel with carving of this school, which is always remarkable for its high finish and delicate cameo-like execution.

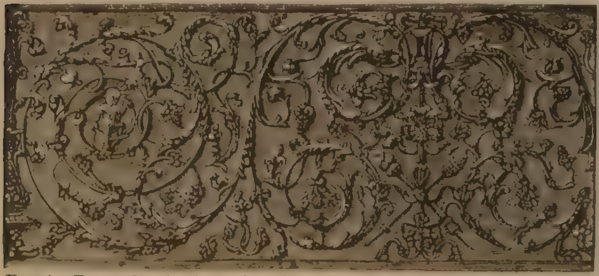

FIG. 4.—Example of a Carved Walnut-Wood Panel; school of Raphael.

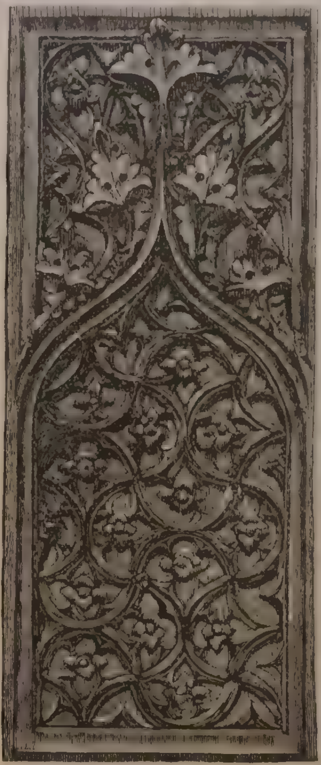

FIG. 5.—Traceried Panel in Oak; French work of the 15th century.

Spanish.—Spain during the 15th and 16th centuries was specially remarkable for the production of large and elaborate retables, carved with statues and reliefs, very like those of contemporary Germany. Alonso Cano and other sculptors frequently used wood for large statuary, which was painted in a very realistic way with the most startling life-like effect.

Danish.—Denmark also possessed a school of able wood-carvers, who imitated the great altar pieces of Germany. A very large and well-carved example still exists in the metropolitan cathedral of Röskilde.

French.—In France during the mediæval period wooden sculpture was produced which was very similar in character to that of England, and was decorated with similar coloring. Many of the French cathedral and abbey choir stalls are works of the utmost magnificence. Those at Amiens are specially remarkable. Fig. 5 shows an example of the delicate tracery work of the 15th century. In the 16th century many wood-carvers in France imitated the rich and delicate work of the Raphaelesque school in Italy, and much wood-work of great refinement was produced, very different from the coarsely effective work of Elizabethan and Jacobean England.[3] In the 18th century large sums were spent on elaborate wooden panelling for rooms, the walls being divided into series of spaces with rococo framing, formed by applied scroll-work, made up of many fantastic and incongruous bits of curved mouldings, which were usually gilt. The general effect was very inartistic, and was unredeemed by any beauty of detail. The intermediate spaces were sometimes filled with tapestry or paintings designed by Watteau, Boucher, or other popular artists.

German.—In Germany during the 15th century, wood was used for the most important sculpturesque purposes, such as large triptychs or retables made up of many reliefs, with sacred subjects, and statues of saints,—the whole framed and canopied with rich Gothic "tabernacle work." See SCULPTURE, vol. xxi. p. 591. Fig. 6 shows a fine example of one of these retables, said to be the work of Veit Stoss, now in the South Kensington Museum. As in England the whole of the wood was covered with fine *gesso*, and then richly gilt and painted with vivid colors. Nothing could exceed the decorative effect of these great retables, rich with minute sculpture and carved foliage, and shining with gold and brilliant colors, some of which were mixed with a transparent varnish medium, and applied over a ground of gold leaf, so that the metallic lustre shone through the transparent pigments over it. Stall ends and panels were enriched with carving of the highest order of merit; life-sized human figures are often introduced at the ends of the book-rests, and large surfaces are covered with grand scroll-work, with the most graceful lines and extreme decorative vigor. Fig. 7 shows a fine example of the treatment of a large panel in the front of the stalls at Ulm cathedral, carved in unusually high relief with bold conventional foliage, full of spirit and vigorous beauty. These splendid stalls were executed in 1468 by Jörg Syrlin. During this period the wood-carving of Germany occupied a foremost position in the world, and in many places, such as Nuremberg and parts of Bavaria, great technical skill has survived down to the present time.

Switzerland and Tyrol have also been for long celebrated for delicate wood-carving on a small scale. The cleverly executed figures of peasants and of animals, especially the chamois, are widely popular, and their production gives occupation to a large class of able artisans, who, however, rarely rise to the level of original artists, though they attain a fairly high average of excellence.

Mohammedan.—Nothing can exceed the skill with which the Moslem wood carvers of Persia, Syria, Egypt, and Spain designed and executed the richest panelling and other decorations for wall-lining ceilings, pulpits, and all kinds of fittings and furniture. The mosques and private houses of Cairo, Damascus, and other oriental cities are full of the most elaborate and minutely delicate wood-work. A favorite style of ornament was to cover the surface with very intricate interlacing patterns, formed by delicately moulded ribs; the various geometrical spaces between the ribs were then filled in with small pieces of wood with carved foliage in slight relief. The use of different woods, such as ebony or box, inlaid so as to emphasize the design, combined with the ingenious richness of the patterns, give this class of wood-work an almost unrivalled splendor of effect. Carved ivory is also often used for the filling in of the flat spaces. Fig. 8 shows a fine example of this sort of work, dating from the 14th century,—part of a wall-lining in the Alhambra; special skill is shown by the way in which the Moslem carver has adapted his design to his material—avoiding curved lines, and utilizing woods which he could only get in small pieces. Another very elaborate class of Oriental wood-work is the rich ceilings and domes built up of small pieces of wood into the ingeniously intricate "stalactite" patterns, which were then covered with stucco and decorated with rich painting in gold and colors.

In the early mediæval period very elaborate wood-work for screens and other fittings was produced for the Coptic churches of Egypt, by native Christian workmen; some of these had small panels carved in a hard dark wood, with saints and Bible subjects in low relief, very Byzantine in style. The British Museum possesses some fine examples of this carved work from a church in Old Cairo. These early wood fittings are now rapidly disappearing.[1]

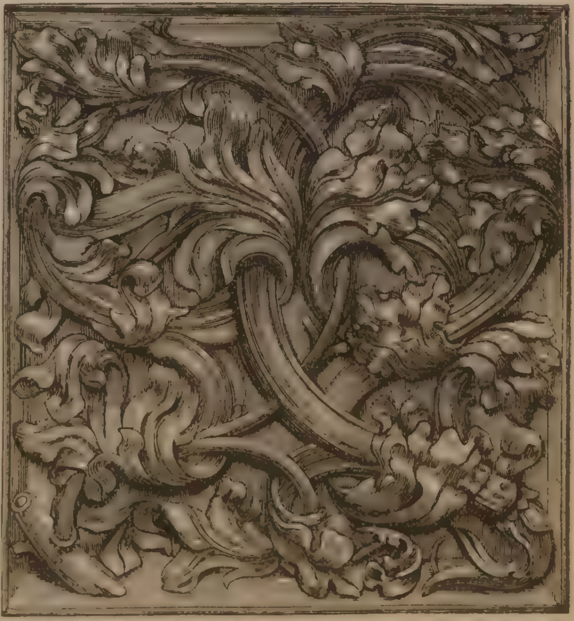

Fig. 7.—Carved Panel from the Front of the Stalls in Ulm Cathedral.

Asiatic.—In India wood-carving of the most magnificent kind has been constantly produced for many centuries. The ancient Hindu temples were decorated with doors, ceilings, and other fittings, carved in sandal and other woods, with patterns of extreme richness and minute elaboration. The doors of the temple at Somnauth, on the northwest coast of

India, were especially famed for their magnificence, and were very highly valued as sacred relics. In 1024 they were carried off to Ghuznee by the Moslem conqueror Sultan Mahmoud, and are now lying in the fort at Agra. The gates which still exist are very fine specimens of ancient wood-carving, but they are probably only copies of the original very early doors.[1]

In many parts of India wood-carving of the most beautiful kind is largely used for architectural purposes, especially for the enrichment of the wooden framework of houses, and for forming delicate open lattices for windows. In the main, however, the native carvers of India excel rather in richness of effect and minute delicacy of workmanship than in general gracefulness of line and purity of design. In these respects the wood-work of Moslem carvers in India is very far superior to that of the Hindus.

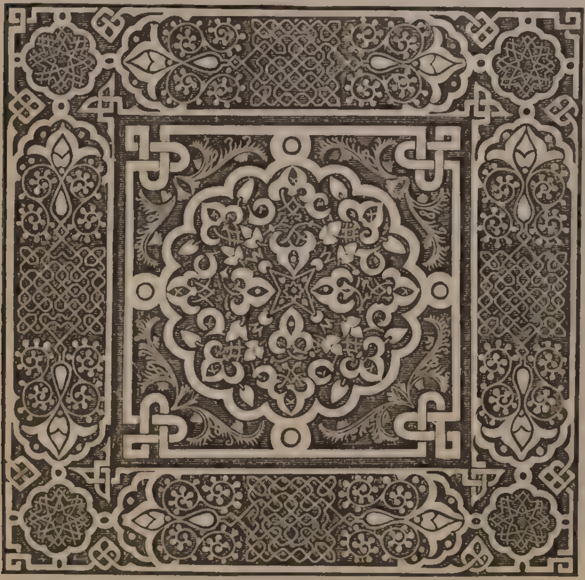

FIG. 8.—Example of Moslem Wood-Panelling, with inlay of different woods.

In China and Japan the wood-carvers are absolutely unrivalled in technical skill; grotesque and imitative work of the most wonderful perfection is produced, and some of the wood-carvings of these countries are really beautiful as works of art, especially when the carver copies the lotus lily or other aquatic plants. In many cases, however, as in the other arts of Japan and China, extreme ugliness of design is combined with the most perfect execution and exquisite finish, and the carvers have very little notion of the really decorative treatment of surface reliefs. The extensive use of wood or bamboo for architectural purposes creates a wide field for the wood-carver, whose very limited sense of true beauty is to some extent made up for by his wealth of grotesque fancy and extreme deftness of hand, which are the main characteristics of the workmen of China and Japan in all branches of art.

Wood-Carving of Savage Races.—Many savage races, such as the Maoris and Polynesians, are very skilful in the decorative treatment of wood in slight relief. Intricate geometrical designs of much beauty and suitability to the material are used to decorate canoes, paddles, and the beams of huts. Great richness of effect is often produced by the smallest possible amount of cutting into the surface of the wood. The wooden architecture of the Maoris is sometimes decorated in the most lavish way. The main uprights of the walls are carved into grotesque semi-human monsters, enriched with painting and inlay of iridescent shell, which show much imaginative power. Other beams are carved with series of spirals, bearing much resemblance to the very early sculptured ornaments of Mycenæ, Tiryns, and other Hellenic cities,—one of the many examples which show that very similar stages of artistic development are passed through by men of the most different races and age. In many cases the freshness of invention and freedom of hand shown in the carved ornament of savage races give a more really artistic value to their work than is usually found in the modern labored and mechanical carving of highly civilized people.

In modern Europe decorative wood-carving shares the general low level of the lesser arts. The commercial spirit of the age, and the general desire to produce the utmost display with the smallest cost and labor, have reduced the art of wood-carving to a very low state.

See Williams, *History of the Art of Sculpture in Wood*, London, 1835; for practical information see Bemrose and Jewitt, *Manual of Wood-Carving*, London, 1862; Rogers, *Art of Wood-Carving*, London, 1867; and Lacombe, *Manuel de la Sculpture sur Bois*, Paris, 1868.
(J. H. M.)

WOODCOCK (A.-S., *Wude-cocc*, *Wudu-coc*, and *Wudu-snite*), a bird as much extolled for the table, on acccount of its flavor, as by the sportsman, who, from its relative scarcity in regard to other kinds of winged game,[2] the uncertainty of its occurrence, as well as the suddenness of its appearance and irregularity of its flight, thinks himself lucky when he has laid one low. Yet, under favorable conditions, large bags of Woodcocks are made in many parts of Great Britain, and still larger in Ireland, though the numbers are trifling compared with those that have fallen to the gun in various parts of the European Continent, and especially in Albania and Epirus. In England of old time Woodcocks were taken in nets and springes, and, though the former method of capture seems to have been disused for many years, the latter was practiced in some places until nearly the middle of the present century (*cf.* Knox, *Game-birds and Wild Fowl*, pp. 148–151) or even later.

The Woodcock is the *Scolopax rusticula*[3] of ornithology, and is well enough known to need no minute description. Its long bill, short legs, and large eyes—suggestive of its nocturnal or crepuscular habits—have over and over again been the subject of remark, while its mottled plumage of black, chestnut- and umber-brown, ashy-gray, buff, and shining white—the last being confined to the tip of the lower side of the tail-quills, but the rest intermixed for the most part in beautiful combination—could not be adequately described within the present allotted space. Setting aside the many extreme aberrations from the normal coloring which examples of this species occasionally present (and some of them are extremely curious, not to say beautiful), there is much variation to be almost constantly observed in the plumage of individuals, in some of which the richer tints prevail while others exhibit a grayer coloration. This variation is often, but not always, accompanied by a variation in size or at least in weight.[4] The paler birds are generally the larger, but the difference, whether in bulk or tint, cannot be attributed to age, sex, season, or, so far as can be ascertained, to locality. It is, notwithstanding, a very common belief among sportsmen that there are two "species" of Woodcock, and many persons of experience will have it that, besides the differences just named, the "little red Woodcock" invariably flies more sharply than the other. However, a sluggish behavior is not really associated with color, though it may possibly be correlated with weight—for it is quite conceivable that a fat bird will rise more slowly, when flushed, than one which is in poor condition. It may suffice here to say that ornithologists, some of whom have taken a vast amount of trouble about the matter, are practically unanimous in declaring against the existence of two "species" or even "races," and moreover in agreeing that the sex of the bird cannot be determined from its plumage, though there are a few who believe that the young of the year can be discriminated from the adults by having the outer web of the first quill-feather in the wing marked with angular notches of a light color, while the old birds have no trace of this "vandyke" ornament. Careful dissections, weighings, and measurings seem to show that the male varies most in size; on an average he is slightly heavier than the female, yet some of the lightest birds have proved to be cocks.[1]

---

[1] See art. ELLENBOROUGH for an account of the recent history of these celebrated doors. They are illustrated in *Archæologia*, xxx. p. 174.

[2] In the legal sense of the word, however, Woodcocks are not "game," though Acts of Parliament require a "game license" from those who would shoot them.

[3] By Linnæus, and many others after him, misspelt *rusticola*. The correct form of Pliny and the older writers seems to have been first restored in 1816 by Oken (*Zoologie*, ii. p. 589).

[4] The difference in weight is very great, though this seems to have been exaggerated by some writers. A friend who has had much experience tells us that the heaviest bird he ever knew weighed 16¼ oz., and the lightest 9 oz. and a fraction.

Though there are probably few if any counties in the United Kingdom in which the Woodcock does not almost yearly breed, especially since a "close time" has been afforded by the legislature for the protection of the species, there can be no doubt that by far the greater number of those shot in the British Islands have come from abroad,—mostly, it is presumed, from Scandinavia. These arrive on the east coast in autumn, generally about the middle of October—often in an exhausted and impoverished state. Most of them seem to cross the sea by night, and at that season it is a brutal practice for men to sally forth and slaughter the helpless and almost starving wanderers, who are often found seeking refuge in any shelter that may present itself. If unmolested, however, they are soon rested, pass inland, and, as would appear, in a marvellously short time recover their condition. Their future destination seems to be greatly influenced by the state of the weather. If cold or frost stop their supply of food on the eastern side of Great Britain they press onward and, letting alone Ireland, into which the immigrant stream is pretty constant, often crowd into the extreme southwest, as Devonshire and Cornwall, and to the Isles of Scilly, while not a few betake themselves to the unknown ocean, finding there doubtless a watery grave, though instances are on record of examples having successfully crossed the Atlantic and reaching Newfoundland, New Jersey, and Virginia. To return, however, to the Woodcocks which breed in Britain, whose habits have been much more frequently observed since the folly and cruelty of killing them in spring has been recognized, and it may be hoped abandoned. Pairing takes place very early in February and the eggs are laid often before the middle of March. These are four in number, of a yellowish cream-color blotched and spotted with reddish-brown, and seldom take the pyriform shape so common among those of Limicoline birds. The nest—always made on the ground amid trees or underwood, and usually near water or at least in a damp locality—is at first little more than a slight hollow in the soil, but as incubation proceeds dead leaves are collected around its margin until a considerable mass is accumulated. During this season the male Woodcock performs at twilight flights of a remarkable kind (*cf.* BIRDS, vol. iii. p. 668), repeating evening after evening (and it is believed at dawn also) precisely the same course, which generally describes a triangle, the sides of which may be a quarter of a mile or more long. On these occasions the bird's appearance on the wing is quite unlike that which it presents when hurriedly flying after being flushed, and though its speed is great the beats of the wings are steady and slow. At intervals an extraordinary sound is produced, whether from the throat of the bird, as is commonly averred, or from the plumage is uncertain. To the present writer the sound seems to defy description, though some hearers have tried to syllable it. This characteristic flight is in some parts of England called "roading," and the track taken by the bird a "cock-road."[2] In England in former times advantage was taken of this habit to catch the simple performer in nets called "cock-shutts," which were hung between trees across the open glades or rides of a wood, and in many parts of the Continent it still is, or was till very lately, the disgraceful habit of persons calling themselves sportsmen to lie in wait and shoot the bird as he indulges in his measured love-flight. A still more interesting matter in relation to the breeding of Woodcocks is the fact, asserted by several ancient writers, but for long doubted if not disbelieved, and yet finally established on good evidence, that the old birds transport their newly-hatched offspring, presumably to places where food is more accessible. The young are clasped between the thighs of the parent, whose legs hang down during the operation, while the bill is to some extent, possibly only at starting, brought into operation to assist in adjusting the load if not in bearing it through the air.[3]

The Woodcock inhabits suitable localities across the northern part of the Old World, from Ireland to Japan, migrating southward towards autumn. As a species it is said to be resident in the Azores and other Atlantic Islands; but it is not known to penetrate very far into Africa during the winter, though in many parts of India it is abundant during the cold weather, and reaches even Ceylon and Tenasserim. The popular belief that Woodcocks live "by suction" is perhaps hardly yet exploded; but those who have observed them in confinement know that they have an almost insatiable appetite for earthworms, which the birds seek by probing soft ground with their highly sensitive and flexible bill.[4] This fact seems to have been first placed on record by Bowles,[5] who noticed it in the royal aviary at San Ildefonso in Spain, and it has been corroborated by other observers, and especially by Montagu, who discovered that bread and milk made an excellent substitute for their ordinary food.

The eastern part of North America possesses a Woodcock, much smaller than though generally (and especially in habits) similar to that of the Old continent. It is the *Scolopax minor* of most authors; but, chiefly on account of its having the outer three primaries remarkably attenuated, it has been placed in a separate genus, *Philohela.* In Java is found a distinct and curiously colored species, described and figured many years ago by Horsfield (*Trans. Linn. Society,* xiii. p. 191, and *Zoolog. Researches,* pl.) as *S. saturata.* To this Mr. Seebohm[6] has lately referred the *S. rosenbergi* of Schlegel (*Nederl. Tijds. v. d. Dierkunde,* iv. p. 54) from New Guinea; but, as the culpable destruction of the type-specimen of the former (during its transfer from the old museum of the East India Company to the British Museum) has made a comparison of the two impossible, the identification can scarcely be said to be free from doubt. Another species is *S. rochusseni* from the Moluccas, but this last, though resembling the other Woodcocks in most of the characters which distinguish them from the SNIPES (*q.v.*), has like the latter the lower part of the tibia bare of feathers. (A. N.)

WOOD-ENGRAVING. See ENGRAVING.

WOODPECKER, a bird that pecks or picks holes in wood, and from this habit is commonly reputed to have its name; but since it is in some parts of England also known as "Woodspeight" (erroneously written "Woodspite")—the latter syllable being cognate with the German *Specht* and the French *Epeiche,* to say nothing possibly of the Latin *Picus*—the vulgar explanation seems open to doubt.[7] More than 300 species of Woodpecker have been described, and they have been very variously grouped by systematists; but all admit that they form a very natural Family *Picidæ*, which according to the view taken in this series of articles belongs to the Order *Picariæ*. Prof. Huxley (*Proc. Zool. Society*, 1867, p. 467) would separate the Woodpeckers still more under the name of *Celeomorphæ*, and Prof. Parker (*Trans. R. Microsc. Society*, 1872, p. 219) would raise them still higher as *Saurognathæ*. They are generally of bright particolored plumage, in which black, white, brown, olive, green, yellow, orange, or scarlet—the last commonly visible on some part of the head—mingled in varying proportions, and most often strongly contrasted with one another, appear; while the less conspicuous markings take the form of bars, spangles, tear-drops, arrowheads, or scales. Woodpeckers inhabit most parts of the world, with the exception of Madagascar and the Australian Region, save Celebes and Flores; but it may be worth stating that no member of the group is known to have occurred in Egypt.

---

[1] *Cf.* Dr. Hoffmann's monograph *Die Waldschnepfe,* ed. 2, p. 35, published at Stuttgart in 1887.

[2] The etymology and consequently the correct spelling of these expressions seem to be very uncertain. Some would derive the word from the French *róder*, to rove or wander, but others connect it with the Scandinavian *rode*, an open space in a wood (see *Notes and Queries*, ser. 5, ix. p. 214, and ser. 6, viii. pp. 523, 524). Looking to the regular routine followed by the bird, the natural supposition would be that it is simply an application of the English word *road*; but of course natural suppositions are often wrong, and they always require the support of evidence before acceptance.

[3] *Cf* J. E. Harting, *Zoologist,* 1879, pp. 433–440, and Mr. Wolf's excellent illustration. Sir R. Payne-Gallwey, in the "Badminton Library" (*Shooting,* ii. p. 118 note), states that he himself has witnessed the performance.

[4] The pair of muscles said by Loche (*Expl. Scient. de l'Algérie* ii. p. 293) to exist in the maxilla, and presumably to direct the movement of the bill, do not seem to have as yet been precisely described.

[5] *Introduccion a la Historia Natural y a la Geografia fisica de España,* pp. 454, 455 (Madrid, 1775).

[6] *Geographical Distribution of the Family* Charadriidæ, p. 506, pl. This work will be found of much interest to those who would speculate on the causes which have led to the distribution of existing Limicoline birds.

[7] The number of English names, ancient and modern, by which these birds are known is very great, and even a bare list of them could not be here given. The Anglo-Saxon was *Higera* or *Higere,* and to this may plausibly be traced "Hickwall," now-a-days used in some parts of the country, and the older "Hickway," corrupted first into "Highhaw," and, after its original meaning was lost, into "Hewhole," which in North America has been still further corrupted into "Highhole" and more recently into "High-holder." Another set of names includes "Whetile" and "Woodwale," which, different as they look, have a common derivation perceptible in the intermediate form "Witwale." The Anglo-Saxon *Wodake* (= Woodhack) is another name apparently identical in meaning with that commonly applied to Woodpecker.

Of the three British species, the Green Woodpecker, *Gecinus* or *Picus viridis*, though almost unknown in Scotland or Ireland, is the commonest, frequenting wooded districts, and more often heard than seen, its laughing cry (whence the name "Yaffil" or "Yaffle," by which it is in many parts known), and undulating flight afford equally good means of recognition, even when it is not near enough for its colors to be discerned. About the size of a jay, its scarlet crown and bright yellow rump, added to its prevailing grass-green plumage, make it a sightly bird, and hence it often suffers at the hands of those who wish to keep its stuffed skin as an ornament. Besides the scarlet crown, the cock bird has a patch of the same color running backward from the base of the lower mandible, a patch that in the hen is black.[1] Woodpeckers in general are very shy birds, and to observe the habits of the species is not easy. Its ways, however, are well worth watching, since the ease with which it mounts, almost always spirally, the vertical trunks and oblique arms of trees as it searches the interstices of the bark for its food, flying off when it reaches the smaller or upper branches—either to return to the base of the same tree and renew its course on a fresh line, or to begin upon another tree near by—and the care it shows in its close examination, will repay a patient observer. The nest almost always consists of a hole, chiselled by the bird's strong beak, impelled by very powerful muscles, in the upright trunk or arm of a tree, the opening being quite circular, and continued as a horizontal passage that reaches to the core, whence it is pierced downward for nearly a foot. There a chamber is hollowed out in which the eggs, often to the number of six, white, translucent, and glossy, are laid with no bedding but a few chips that may have not been thrown out.[2] The young are not only hatched entirely naked, but seem to become fledged without any of the downy growth common to most birds. Their first plumage is dull in color, and much marked beneath with bars, crescents, and arrowheads.

Of generally similar habits are the two other Woodpeckers which inhabit Britain—the Pied or Greater Spotted, and the Barred or Lesser Spotted Woodpecker—*Dendrocopus major* and *D. minor*—each of great beauty, from the contrasted white, blue-back, and scarlet that enter into its plumage. Both of these birds have an extraordinary habit of causing by quickly-repeated blows of their beak on a branch, or even on a small bough, a vibrating noise, louder than that of a watchman's rattle, and enough to excite the attention of the most incurious. Though the Pied Woodpecker is a resident in Britain, its numbers receive a considerable accession nearly every autumn.

The three species just mentioned are the only Woodpeckers that inhabit Britain, though several others are mistakenly recorded as occurring in the country—and especially the Great Black Woodpecker, the *Picus martius* of Linnæus, which must be regarded as the type of that genus.[3] This fine species considerably exceeds the Green Woodpecker in size, and except for its red cap is wholly black. It is chiefly an inhabitant of the fir forests of the Old World, from Lapland to Galicia, and across Siberia to Japan.[4] In North America this species is replaced by *Picus pileatus*, there generally known as the Logcock, an equally fine species, but variegated with white; and further to the southward occur two that are finer still, *P. principalis*, the Ivory-billed Woodpecker, and *P. imperialis*. The *Picinæ* indeed flourish in the New World, nearly one-half of the described species being American, but out of the large number that inhabit Canada and the United States there is here room to mention only a few.

First of these is the Californian Woodpecker, *Melanerpes formicivorus*, which has been said to display an amount of providence beyond almost any other bird in the number of acorns which it collects, and, as shown in the accompanying figure, fixes tightly in holes which it purposely makes in the bark of trees, and thus "a large pine forty or fifty feet high will present the appearance of being closely studded with brass nails, the heads only being visible." An extraordinary thing is that this is not done to furnish food in winter, for the species migrates, and after journeying a thousand miles or more only returns in spring to the forests where its supplies are laid up. It has been asserted that the acorns thus stored are always those which contain a maggot, and, being fitted into the sockets prepared for them cup-end foremost, the enclosed insects are unable to escape, as they otherwise would, and are thus ready for consumption by the birds on their return from the south. But this statement has again been contradicted, and moreover it is alleged that these Woodpeckers follow their instinct so blindly that "they do not distinguish between an acorn and a pebble," so that they "fill up the holes they have drilled with so much labor, not only with acorns but occasionally with stones" (*cf.* Baird, Brewer, and Ridgway, *North American Birds*, ii. pp. 569–571).

Californian Woodpecker (*Melanerpes formicivorus*).

The next North-American form deserving notice is the genus *Colaptes*, represented in the north and east by *C. auratus*, the Golden-winged Woodpecker or Flicker, in most parts of the country a familiar bird, but in the south and west replaced by the allied *C. mexicanus*, easily distinguishable among other characteristics by having the shafts of its quills red instead of yellow. It is curious, however, that, in the valleys of the Upper Missouri and Yellowstone rivers, where the range of the two kinds overlaps, birds are found presenting an extraordinary mixture of the otherwise distinctive features of each, and these birds have been described as hybrids. It would be premature to say whether this view be correct or not, and in regard to it Dr. Coues has well remarked (*Birds of the Northwest*, p. 294), "that it is only in virtue of missing links we are enabled to predicate species in any case," thereby indicating the possibility (not entertained for the first time) that these supposed hybrids are examples of the more generalized form of *Colaptes*, which becomes differentiated further to the north and south in the specialized *C. auratus* and *C. mexicanus*. Thus the subject is one highly interesting to the student of evolution.[1]

---

[1] A patch of conspicuous color, generally red, on this part is characteristic of very many Woodpeckers, and careless writers often call it "mystacial," or some more barbarously "moustachial." Considering that moustaches spring from above the mouth, and have nothing to do with the mandible or lower jaw, no term could be more misleading.

[2] It often happens that, just as the Woodpecker's labors are over, a pair of STARLINGS (*q.v.*) will take possession of the newly-bored hole, and, by conveying into it some nesting furniture, render it unfit for the rightful tenants, who thereby suffer ejectment, and have to begin all their trouble again. It has been stated of this and other Woodpeckers that the chips made in cutting the hole are carefully removed by the birds to guard against their leading to the discovery of the nest. The present writer has had ample opportunity of observing the contrary as regards this species and, to some extent, the Pied Woodpecker next to be mentioned. Indeed there is no surer way of finding the nest of the Green Woodpecker than by scanning the ground in the presumed locality, for the tree which holds the nest is always recognizable by the chips scattered at its foot.

[3] The expression *Picus martius* was by old writers used in a very general sense for all birds that climbed trees, not only Woodpeckers, but for the NUTHATCH and TREECREEPER (*qq.v.*) as well. The adjective *martius* loses all its significance if it be removed from *Picus*, as some even respectable authorities have separated it.

[4] The persistency with which many writers on British birds have for years included this species among them is a marvellous instance of the durability of error, for not a case of its asserted occurrence in this country is on record that will bear strict investigation, and the origin of the mistake has been more than once shown.

Some other Woodpeckers deserve especial notice,—among them the *Colaptes* or *Soroplex campestris*, which inhabits the treeless plains of Paraguay and La Plata, and had become fully adapted to a territorial mode of life, as long ago observed by Azara and Darwin, but yet has readily returned, since the opportunity has been afforded, to the arboreal habits of its relatives, as remarked by Mr. Hudson (*Proc. Zool. Society*, 1870, pp. 158–160). A similar provision of habit and haunt obtains in a South-African Woodpecker, *Geocolaptes olivaceus*, which lives almost entirely on the ground or rocks, and picks a hole for its nest in the bank of a stream (*Zoologist*, 1882, p. 208).

The *Picidæ* offer a fruitful ground for taxonomical speculation. At least three Subfamilies are admitted by all modern systematists—the Woodpeckers proper, *Picinæ*; the Piculets, *Picumninæ*, which are small birds wanting the stiff rectrices of the former; and the WRYNECKS (*q.v.*). Sundevall (*Conspectus Avium Picinarum*, Stockholm, 1866) gave up the attempt to establish genera in the first of these, though he separated the 254 species which he admitted into 4 Series and 30 Tribes, thereby differing from the method of Malherbe, who, in his great monograph of the Family,[2] recognized 277 species and 19 genera, as well as from Prof. Cabanis, who (*Mus. Heineanum*, iv. part 2) strove to establish 48 genera in about three-fourths of the whole Family, and from G. R. Gray, who in his *Hand List* recognized 4 Subfamilies, 19 genera, 74 subgenera, and 312 species. It seems obvious that until the aid of the anatomist is invoked no satisfactory arrangement can be supplied, and it is not certain that even then will the desired end be reached, for Macgillivray, who furnished Audubon with elaborate descriptions of parts of the structure of several North-American forms, found considerable differences to exist between species which can hardly be but nearly allied. Some of the most striking of these differences often lie in the form and development of the hyoid bones, and of the muscles which work the extensile tongue. Unhappily the subject does not seem to have been pursued by any other investigator; but it may be mentioned that some limited researches on the *pterylosis*, conducted by Kessler (*Bull. Soc. Nat. Moscou*, xvi. p. 285), in addition to those of Nitzsch, indicate that as being also a promising line of inquiry, though one that has scarcely been attempted by any other workers.[3] (A. N.)

WOODSTOCK, an ancient corporate market-town of Oxfordshire, England, is situated on a stream formerly called the Ennis and now the Glyme, which separates Old and New Woodstock, about 8 miles northwest of Oxford. The church of St. Mary Magdalene, in New Woodstock, is of Norman date, but has been greatly altered by restoration, and now has Decorated chancel with Perpendicular additions, clerestoried nave, Decorated north aisle and Early English south aisle retaining a portion of the Norman doorway, Perpendicular west porch, and Perpendicular west tower. The church contains many interesting monuments. The town-hall, erected in 1766 after the designs of Sir William Chambers, includes a market-place and the fire brigade station, with public hall and council-chamber above. Almshouses were erected in 1798 by Caroline, duchess of Marlborough, and endowed with £3500 [$18,585], which has been increased by bequest at different periods. The town is dependent chiefly on agriculture, but the manufacture of leather gloves has been carried on from an early period. By the Municipal Corporations Act, 1882, the borough (area about 30 acres), formerly governed by a charter of Charles II., was placed under a corporation. The population of the parliamentary borough (area 20,804 acres), which has been extended in 1832 and ceased to be separately represented in 1885, was 7033 in 1881.

The old manor house of Woodstock, which is supposed to have been built upon the site of a Roman villa, was at an early period a royal residence. Here Alfred the Great is said to have resided while translating Boetius. At a witenagemot held at Woodstock by King Ethelred a code of laws was published for the government of the Anglo-Saxon kingdom. Henry I. made Woodstock a favorite residence, and formed a zoological garden there. Woodstock was the scene of Henry II.'s courtship of Rosamond Clifford, and his frequent visits to the place led to the building of the nucleus of the town of New Woodstock. A first assize was held at Woodstock in 1184. It sent representatives to parliament from 1301–2 till 1885. It was incorporated by Henry VI. in 1453, and the charter was confirmed and extended by successive monarchs, that granted by Charles II. remaining the governing charter till 1882. Queen Elizabeth was a prisoner at Woodstock from May, 1554, till May, 1555, and after her accession to the throne visited it in 1566 and again in 1575. In 1576 she made the town a staple of wool and yarn. Woodstock was visited by James I. and by Arabella Stuart. During the Civil War it was the scene of frequent military operations, and after a siege it surrendered to the parliament 20th April, 1646. After the battle of Blenheim the manor of Woodstock was by Act 3 and 4 of Queen Anne, chap. 4, bestowed in perpetuity on John duke of Marlborough. Blenheim palace, built by the duke from the designs of Sir John Vanbrugh, was completed in 1715. In 1723 the old manor house was destroyed and the site levelled.

See Marshall's *Early History of Woodstock Manor*, 1873.

WOODSTOCK, a town, port of entry, and the captial of Oxford county, province of Ontario, Canada, is situated on the river Thames and Cedar Creek, and on the Great Western Railway, 80 miles southwest of Toronto. The trade is of growing importance. There is good water-power, and the town possesses several corn-mills and a woollen factory. Its healthy situation and the beauty of the neighboring scenery attract a number of summer visitors. The population in 1881 was 5373.

WOOD-WORK. See BUILDING, vol. iv. pp. 426–448.

WOOL AND WOOLLEN MANUFACTURES. Wool is a modified form of hair, distinguished by its slender, soft, and wavy or curly structure, and by the highly imbricated or serrated surface of its filaments. The numerous varieties of the sheep are the most characteristic, as they are also by far the most important producers of wool; but the sheep is by no means the only animal which yields wool employed for industrial purposes. The alpaca and other allied fibres obtained from the alpaca and its congeners in South America (see ALPACA, vol. i. p. 526, and LLAMA, vol. xiv. pp. 744–46), the mohair yielded by the Angora goat (MOHAIR, vol. xvi. p. 568), and the soft woolly hair of the camel are all wools of much industrial importance, while the most costly wool in the world is that yielded by the Cashmere goat of the Himalayan Mountains. At what point indeed it can be said that an animal fibre ceases to be hair and becomes wool it is impossible to determine, because in every characteristic the one class by imperceptible gradations merges into the other, so that a continuous chain can be formed from the finest and softest merino to the rigid bristles of the wild boar.

Next to cotton, wool is the most important of all textile fibres used by mankind. From the ease with

---

[1] When more is known it will very likely be found that a somewhat similar state of things exists in the Palæarctic area in regard to the various local races of, or "species" allied to, *Dendrocopus major* and *D. minor* respectively. At present the only cases that seem to be strictly parallel are those furnished by the genera *Coracias* (*cf.* ROLLER) and *Euplocamus* (*cf.* PHEASANT).

Early history.

which it may be made into thread, and owing to the comfort derived from clothing of woollen texture, it naturally would be the textile first used by mankind for clothing. The testimony of all ancient records goes to prove the high antiquity of woollen textures and the early importance of the sheep. The different kinds of wool and the cloth made from them in antiquity are described by Pliny (*H. N.*, viii. 73, 74, 190 *sq.*).

Wool in Britain.

Among the arts of civilized life which the British Isles owe to the Romans not the least important was the spinning and weaving of wool. The sheep certainly was a domestic animal in England long before the period of the Roman occupation; and it is most probable that such use was made of sheep skins and of wool as was common among uncivilized races. But the Romans established a woollen factory whence the occupying army was supplied with clothing, and the value of the manufacture was soon recognized by the Britons, of whom Tacitus remarks, "Inde etiam habitus nostri honor et frequens toga" (*Agric.*, c. 21). The product of the Winchester looms, and the wool whence it was made, soon established a reputation abroad, it being remarked that "the wool of Britain is often spun so fine that it is in a manner comparable to the spider's thread." The reputation which English wool at this early period established was maintained throughout mediæval times; and the fibre was in great demand in the Low Countries and other Continental centres where skill in manufacture was highly developed. There are many allusions to woollen manufactures in England in early times; but altogether the native industry could not rival the products of the Continent, although the troubles in various industrial centres, from time to time, caused skilled workers in wool to seek an asylum in England. In the time of William the Conqueror Flemish weavers settled under the protection of the queen at Carlisle, but subsequently they were removed to Pembrokeshire. At various periods in the reigns of succeeding monarchs further immigrations of skilled Flemish weavers occurred, and they were planted at different places throughout the country. The cloth fair in the church yard of the priory of St. Bartholomew was instituted by Henry II.; guilds of weavers were established; and the exclusive privilege of exporting woollen cloth was granted to the city of London. Edward III. made special efforts to encourage woollen industries according to the manner in which it was supposed in mediæval times that trade could be best encouraged. He brought weavers, dyers, and fullers from Flanders; he himself wore Flemish cloth; and to stimulate native industry he prohibited under pain of life and limb the exportation of English wool. Previous to the time of Edward III. English wool had been in larger demand on the Continent, where it had a reputation exceeded only by the wool of Spain, which for ages provided Europe with the best material for cloth-making. The customs duties levied on the export of wool were an important source of the royal revenue, and Edward III.'s attempt to stop the trade appears to have been an honest though misguided attempt to foster native manufactures. His prohibitory law was, however, found to be unworkable, and the utmost that both he and his successors were able to effect was to hamper the export trade by vexatious restrictions and to encourage much "running" or smuggling of wool. Thus while Edward III. limited the right of exporting to merchant strangers, we find that Edward IV. decreed that no alien should export wool and that denizens should export it only to Calais. Legislation of this kind prevailed till the reign of Elizabeth, when the free exportation of English wool was permitted; and Smith, in his *Memoirs of Wool*, points out that it was during this reign that the manufacture made the most rapid progress in the country. In 1660 the absolute prohibition of the export of wool was again decreed, and it was not till 1825 that this prohibitory law was finally repealed. The prohibition appears to have been based on the mistaken notion that England possessed a monopoly of the finest kinds of wool, and that by withholding it from foreign competitors the home manufacturers would command the markets of the world. The results of the prohibitory law were exceedingly detrimental; the production of wool far exceeded the consumption; the price of the raw material fell; wool "running" or smuggling became an organized traffic; and the whole industry became disarranged. Extraordinary expedients were resorted to for stimulating the demand for woollen manufactures, among which was an Act passed in the reign of Charles II. decreeing that all dead bodies should be buried in woollen shrouds,—an enactment which remained in the Statute Book, if not in force, for a period of 120 years. On the opening up of the colonies, every effort was made to encourage the use of English cloth, and the manufacture was discouraged and even prohibited in Ireland.

It was not without reason that the attention of monarchs and legislators was so frequently directed to the woollen industries. Wool was indeed "the flower and strength and revenue and blood of England," and till the developement of the cotton trade, towards the end of the 18th century, the woollen industries were, beyond comparison, the most important sources of wealth in the country. What the actual value of the trade at any early period was it is impossible to ascertain, and the estimates of wool production and the value of the manufactures in the 17th and 18th centuries vary widely. Towards the close of the 17th century the wool produced in England was estimated to be worth £2,000,000 [$11,624,000] yearly, furnishing £8,000,000 [$41,496,000] worth of manufactured goods, of which there was exported about £2,000,000 [$11,624,000] in value. In 1700 the official value of woollen goods exported was about £3,000,000 [$17,436,000], and in the third quarter of the century the exports had increased in value by about £500,000 [$2,650,000] only. In 1774 Dr. Campbell (*Political Survey of Great Britain*) estimated the number of sheep in England at 10,000,000 or 12,000,000, the value of the wool produced yearly at £3,000,000 [$15,900,000], the manufactured products at £12,000,000 [$63,600,000], and the exports at £3,000,000 [$15,900,000] to £4,000,000 [$21,200,000]. He also reckoned that the industry then gave employment to 1,000,000 persons. These figures, in the light of the dimensions of present day industries, may appear small, but they bore a predominant relationship to the other great sources of employment and trade of the period. In 1800 the native crop of wool was estimated to amount to 96,000,000 ℔; and, import duty not being imposed till 1802, the quantity brought from abroad was 8,600,000 ℔, 6,000,000 ℔ of which came from Spain. In 1825 the importation of colonial wool became free, the duty leviable having been for several previous years as high as 6d. per ℔, and in 1844 the duty was finally remitted on foreign wool also.

Wool in America.

Sheep were introduced at Jamestown in Virginia in 1609, and in 1633 the animals were first brought to Boston. Ten years later a fulling mill was erected at Rowley, Mass., "by Mr. Rowley's people, who were the first that set upon making cloth in this western world." The factory woollen industry was, however, not established till the close of the 18th century, and it is recorded that the first carding machine put in operation in the United States was constructed in 1794 under the supervision of John and Arthur Schofield.

The sheep.

The prevailing color of sheep's wool is white, but it must not be forgotten that there are races with black, brown, fawn, yellow, and gray shades of wool. For manufacturing purposes generally white wool is, of course, most valuable, but for the homespuns, which in earlier times absorbed the bulk of wool, natural colors were in many cases desirable and used with good effect. In domestic spinning, knitting and weaving, natural colors are still largely taken advantage of, as in the cases of rough yarns, Shetland knitted shawls, Highland tweeds, etc.

Characteristics of wool.

As has already been indicated, the distinction between wool and hair lies chiefly in the great fineness, softness, and waved delicacy of woollen fibre, combined with a highly serrated surface. These peculiarities are precisely the characters which give wool its distinctive value as a textile fibre, and most distinctive of all is the serrated structure which specially belongs to wool and gives it the important property of felting, upon which many of its applications depend. The serrations of wool and the wavy structure it assumes are closely connected, those wools which have the greatest number of serrations being also most finely waved in structure. The appearance presented by wool under the microscope, as compared with the aspect of certain other animal fibres, is shown in Fig. 1 (compare vol. ix. p. 115). The imbrications all lie in one direction,—from the root, their growing point, upwards to the apex of the fibre,—so that, while a lock of wool drawn between the finger and thumb from the root end outwards slips quite smoothly, if drawn in the contrary direction from point to root it offers a distinct resistance, and the fibre feels harsh and rough. Under the influence of moisture and pressure, tangled masses of wool thoroughly interlock and mat together, by the mutual clutching of the serrations of the fibres, and it is thus that the shrinking and thickening of woollen textures under washing is accounted for, and the capacity of cloth for felting or fulling is due to this condition of the fibre. The serrations are most numerous, acute, pointed, and distinct in fine merino wools, as many as 2800 per inch being counted in specimens of the finest Saxony wools. In the Leicester wool of England, on the other hand, which is a long bright staple, the serratures are not only much fewer in number, counting about 1800, but they are also less pronounced in character, so that the fibre presents a smoother, less waved character. In some inferior wools the serrations are not so many as 500 per inch. A similar difference may be noted in the fineness of the fibres. Saxony lambs' wool has a diameter of from $\frac{1}{1500}$ to $\frac{1}{1800}$ inch, whilst coarse Algerian wools may rise to a maximum diameter of about $\frac{1}{275}$ inch

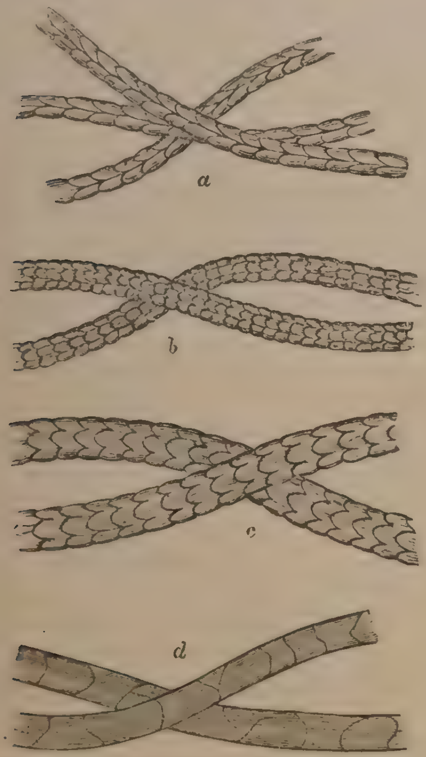

FIG. 1.—Microscopic Structure of Wool. *a*, merino; *b*, Southdown; *c*, Leicester; *d*, mohair.

Other distinguishing qualities of good wool consist in uniformity of strength of fibre with freedom from tender or weak portions in its length, a condition which not unfrequently arises from ill health in the sheep. In ill-bred wool there may also be found intermingled "kemps" or dead hairs,—straight coarse shining fibres which show conspicuously among the wool, and become even more prominent in the manufactured and dyed goods. Wool also possesses a softness of touch and an elasticity both in the raw and manufactured condition which distinguish it from all other fibres. In length of staple it varies very much, attaining in combing wools to a length of as much as 15 to 20 inches. As a rule the fine felting wools are short in staple, these constituting carding or woollen yarn wools; and the longer are lustrous and comparatively straight, and thus most suitable for combing or worsted wools. The latter wools approach mohair and alpaca in their characters, and they are prepared and spun by the same class of machinery.

The bulk of the wool of commerce comes into the market in the form of fleece wool, the product of a single year's growth, cut from the body of the living animal. The first and finest clip, called lambs' wool, may be taken from the young sheep at about the age of eight months. When the animal is not shorn till it attains the age of twelve or fourteen months the wool is known as hogg or hogget, and it, like lambs' wool, is fine and tapers into long thin ends. All subsequently cut fleeces are known as wether wool, and possess relatively somewhat less value than the first clip. Fleece wool as it comes into the market is either "in the grease," that is, unwashed, and with all the dirt which gathers to the surface of the greasy wool present; or it is received as "washed" wool, the washing being done as a preliminary to the sheep-shearing. Skin wool is that which is obtained from sheep which either die or are killed. Such wool is always of inferior value and much impregnated with lime from the steeping pits in the tan-yards in which the skins are first treated to soften and swell the skin for facilitating the easy separation of the wool from it.

The wool market is supplied from almost every quarter of the globe, and the qualities and varieties of the article are exceedingly numerous. The range of woollen and worsted manufactures is also very wide, and the raw material suitable for one section of the trade is not at all fitted to supply other sections. Much more than is the case in any other textile industry we have in the woollen trades practically a series of separate and distinct industries, each with its own appropriate class of raw materials. The main distinctions are—(1) carding wools, in which felting properties are desirable; (2) combing wools, requiring length of staple and brightness of fibre, for hard-spun non-felting worsteds; and (3) carpet and knitting wools, in which long and strong if somewhat coarse staple are the essential qualities. Breeding, climate, and food are the main factors in developing and rearing special races of sheep in which the qualities essential for producing the raw materials of any of these sections of industry are secured.

Merino wool.

For centuries the finer wools used for cloth-making throughout Europe were obtained from Spain, which was the home of the famous merino breed developed from races of sheep originally introduced into the Peninsula by the Romans. Till early in the present century the superiority of Spanish merinos remained unchallenged, but the Peninsular War and its attendant evils produced a depreciation of quality concurrently with the introduction of Saxon and Silesian wools, which suddenly supplanted the product of Spain, and hold the first place down to the present day. The Spanish merino sheep was introduced into Saxony by the elector in 1765, and by judicious crossing with the best native race developed the famous electoral breed. Merinos were carried to Hungary in 1775, and to France in 1776, and in 1786 Daubenton brought them to Rambouillet, whence a famous race developed. In 1802 the first merinos known to have left pure descendants were taken to the United States, and in 1809–10 an importation (4000) of merino sheep was made. The introduction of merino blood has also largely modified certain of the breeds of English sheep, and from them, crossed with the English breeds, Southdowns and Leicesters, have sprung the vast flocks of sheep in the various Australasian colonies, which now bid fair to supply the whole world with wools of the merino class, and of the very highest quality.

Colonial wool.

Of colonial wools, which are now by a long way the most important supplied to the British market, the best qualities come from Port Phillip, Sydney, and Adelaide, the first of these being excelled in quality as a cloth-making wool by the merinos of Saxony and Silesia alone. New Zealand also yields a very large annual crop of wool of high quality, and the wool of Tasmania is generally of fine color, sound and uniform in staple. The Cape of Good Hope is the source of a large supply of wool, much of which, however, is unequal in strength and somewhat kempy in character. A great proportion of the wool which comes from South America is seriously deteriorated by burrs, and it is of a character which fits it for the worsted manufacture alone.

British wool.

The wools grown in the United Kingdom may be separated into three classes—(1) short or carding wool; (2) long or combing wool; and (3) blanket, carpet, and knitting wool. Of short wools Southdown may be taken as the type and best example. It is a staple of excellent quality, milling well, and suitable either for the woollen or worsted trade. The long wools of greatest importance are obtained from the Lincoln and Leicester sheep. These breeds yield a long fleece of remarkable lustre, and it was the possession of this class of wool which gave England its high reputation in former times as a wool-producing country. A similar quality of wool is also obtained from the East Riding Yorkshire breed of sheep. Cheviot wool approaches the Leicester class in some qualities, but is destitute of the latter's peculiar lustre, and is shorter in staple, though strong in fibre, with good milling qualities, which render it valuable for the tweed manufacture. Intermediate between the long and short there are several British breeds, which have been established either by crosses or local conditions and treatment, the most important of these being found in Shropshire, Staffordshire, and Norfolk. The carpet wools are yielded by sheep of the type of the Blackface of the mountainous regions of Scotland, from which is obtained a fleece of long staple but somewhat unequal qualities. Much of the Highland wool is "laid," that is, impregnated with tar, from the practice of the stock-masters of smearing the animals with a mixture of tar and fat immediately after shearing, with a view of protecting them from the rigors of the climate. Of wools of a special character there may be noted Welsh wool, which possesses properties fitting it pre-eminently for the making of the famed Welsh flannels, and Shetland wool, which, being very fine and soft in its nature, is almost entirely worked up into delicate yarns for knitting the well-known Shetland shawls and other knitted work.

The weight of a fleece of wool of the various breeds of sheep ranges from under 2 ℔ in the case of the small Shetland breeds up to 8 or 9 ℔ for the large merinos and other heavy races, and in exceptional cases a heavy ram's fleece may reach so much as 15 ℔; but, taken all over, sheep may be reckoned to yield on an average 5 ℔ of wool in a year.

Sheep washing.

Where there is abundance of water and other conveniences it is the practice to wash or half-wash sheep previous to shearing, and such wool comes into the market as washed or half-washed fleece. The surface of a fleece has usually a thick coating of dirt adhering to it, and in the cases of merino breeds the fleece surface is firmly caked together into large solid masses, from the adhesion of dirt to the wool constantly moist with the exudation from the skin of the greasy yolk or "suint," so that in an unwashed fleece nearly 30 per cent. of weight may represent dirt, and about 40 per cent. the greasy suint which lubricates the wool, while the pure wool is not more than one-third part of the whole. The yolk forms a protective covering to the sheep, rendering the fleece impervious to moisture, and while left in the wool also preserves it soft, pliant, and silky to touch. It forms a kind of natural soap, consisting principally of potash salts with animal oil, almost entirely soluble in cold water. The following analyses of German merino wool—the variety in which suint is most largely developed—illustrate the difference which may result in the composition of the fibre from the simple washing of the fleece on the sheep's back:

	Unwashed Merino		Washed Merino.	
Mineral matter	6.3	16.8	0.94	1.3
Suint and fatty matter	44.3	44.7	21.00	40.0
Pure wool	38.8	28.5	72.00	56.0
Moisture	11.4	7.0	6.06	2.7

Wool, however, which is merely washed in the rough-and-ready manner described below still retains great and variable quantities of suint, etc. Where running streams exist, the sheep are penned by the side of the water, and taken one by one and held in the stream while they are washed, one man holding and the other washing. The operation is objectionable in many ways, as it pollutes the stream, and it dissipates no mean amount of potash salts, valuable for manure or for other chemical purposes. Sheep washing appliances are now largely employed, the arrangement consisting of a pen into which the sheep are driven and subjected to a strong spray of water either hot or cold, which soaks the fleece and softens the dirt. This done, they are caused to swim along a tank which narrows towards the exit, and just as they pass out of the pen they are caught and subjected to a strong douche of pure water. After a few days the wool of a washed sheep is sufficiently dry for shearing or clipping, which is thereupon done.

Sheep shearing.

A skilful shepherd will clip the fleece from a sheep in one unbroken continuous sheet, retaining the form and relative positions of the mass almost as if the creature had been skinned. In this unbroken condition each fleece is rolled up by itself, which greatly facilitates the sorting or stapling which all wool undergoes for the separation of the several qualities which make up the fleece.

Wool stapling.

Sorting or stapling was formerly a distinct industry, and to some extent it is so still, though frequently the work is done in the premises of the spinners. Carding wools are separated and classed differently from combing wools, and in dealing with fleeces from different races the classification of the sorter varies. In the woollen trade short-staple wool is separated into qualities, known, in descending series from the finest to the most worthless, as picklock, prime, choice, super, head, seconds, abb, and breech, and the proportions in which the higher and lower qualities are present are determined by the qualities of the fleece or the race yielding the wool. In the worsted trade the classification goes, also in descending series, from fine, blue, neat, brown, breech, downright, seconds, to abb. The last three are short and not commonly used in the worsted trade.

The greater proportion of good English long wool will be classified as blue, neat, and brown; it is only in exceptional cases that more than from 5 to 8 per cent. is "fine" on the one hand, or of lower quality than breech on the other. Generally speaking, the best portion of a fleece is from the shoulders and side of the animal (1 in Fig. 2). The wool from 2 is irregular in growth, and often filled with burrs, etc.; from the loin 3 it is shorter of staple and coarser, characters which become increasingly pronounced as we approach the tail and hind quarter 4. The belly wool 5 is short, worn, and dirty, as is also the front of the throat 6, while on the head and shins 7 the product is short, stiff, and straight, more like hair than wool.

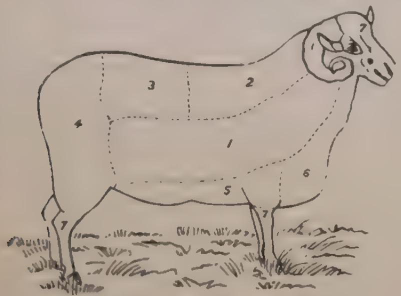

FIG. 2.—Qualities of Fleece.

The sorter works at a table or frame covered with wire netting through which dust and dirt fall as he handles the wool. Fleeces which have been hard packed in bales, especially if unwashed, go into dense hard masses, which must be heated till the softening of the yolk and the swelling of the fibres make them pliable and easily opened up. When the fleece is spread out the stapler first divides it into two equal sides: then he picks away all straws, large burrs, and tarry fragments which are visible; and then with marvellous precision and certainty he picks out his separate qualities, throwing each lot into its allotted receptacle. Sorting is very far removed from being a mere mechanical process of selecting and separating the wool from certain regions of the fleece, because in each individual fleece qualities and proportions differ, and it is only by long experience that a stapler is enabled, almost as it were by instinct, rightly to divide up his lots, so as to produce even qualities of raw material.

Scouring.

The washing which a fleece receives on the live sheep is not sufficient for the ordinary purposes of the manufacturer. The scouring process is thus the first link in the long chain of manufacturing processes through which wool passes. On the careful and complete manner in which scouring is effected much depends. The qualities of the fibre may be seriously injured by injudicious treatment, while, if the wool is imperfectly cleansed, it will take on dye colors unevenly, and all the subsequent manufacturing operations will be more or less unsatisfactory. The water used should be soft and pure, both to save soap and still more because the insoluble lime soap formed in dissolving soap in hard water is deposited on the woollen fibres and becomes so entangled that its removal is a matter of extreme difficulty. Wool washed with hard water is always harsh to the touch, and takes on dye colors but unevenly, owing to the interference of unremoved lime soap. In former times stale urine was a favorite medium in which to scour wool; but that is now disused, and a specially prepared potash soap is the detergent principally relied on. Excess of alkali has to be guarded against, since uncombined caustic acts energetically on the wool fibre, and is indeed a solvent of it. On this account a soap solution of too great strength leaves the wool harsh and brittle, and the same detrimental result arises when the soapy solution is applied too hot.

In former days, when the method of hand scouring prevailed, the wool to be washed was placed with hot soapsud in a large scouring "bowl" or vat, and two men with long poles kept stirring it gently about till the detergent loosened and separated the dirt and dissolved the grease. The wool was then lifted out and drained, after which it was rinsed in a current of clean water to remove the "scour," and then dried. These operations are now performed by mechanical agencies; and, to save soap, it is the practice to first steep the wool in steepers,—tubs having a perforated false bottom in which steam is blown through the wool steeped in pure water. The process removes much mechanically mixed dirt, and softens the other impurities, expanding the fibres themselves, and thus rendering the scouring operation easier and more expeditious. In machine scouring the object aimed at is to bring all the wool equally under the influence of the soapy solution, and to prevent it from matting into lumps in its progress through the washing bowls. Usually the wool passes through two sets of bowls, the soap solution being stronger in the first set. The wool is fed into one extremity of the bowl, which is an oblong vat, by an endless apron from which it passes to an immersed plate which sinks it into the hot soapy solution, where the whole is thoroughly soaked. It is then carried to the opposite end of the bowl, either by a series of forks or rakes with reciprocating motion, or by sets of iron prongs fixed at a uniform distance on a frame to which reciprocating action is communicated by eccentric mounting. These carry the wool forward by gentle progression, so as not to ball it, till at the upper end it is caught and squeezed between rollers to wring out part of the water from the fibres, and then passed on for further drying.

Drying.

The more gently and uniformly the drying can be effected the better is the result attained, and over-drying of wool has to be specially guarded against. By some manufacturers the wool from the squeezing rollers is whizzed in a hydro-extractor, which drives out so much of the moisture that the further drying is easily effected. The commonest way, however, of drying is to spread the wool as uniformly as possible over a framework of wire netting, under which are a range of steam-heated pipes, the sides being enclosed in a framing of wood. A fan blast blows air over these hot pipes, and the heated air passes up and is forced through the layer of wool which rests on the netting. Unless the wool is spread with great evenness it gets unequally dried, and at points where the hot air escapes freely it may be much over-dried. A more rapid and uniform result is obtained by the use of Petrie's wool drier, which consists of a close chamber divided into five horizontal compartments, the floors of which consist of alternate fixed and movable bars. Under the chamber are a tubular heating apparatus and a fan by which a powerful current of heated air is blown up the side of the chamber, and through all the shelves or compartments successively, passing in the path over which the wool slowly travels. The wool is entered by continuous feed at one side of the chamber; the strength of the blast carries it up and deposits it on the upper shelf, and by the action of the movable bars, which are worked by cranks, it is carried forward to the opposite end, whence it drops to the next lower shelf, and so on it travels till at the extremity of the lower shelf it passes out by the delivery lattice well and equally dried. Moore's drier is a simpler and less expensive form of drying apparatus, intermittent in its action. It consists of a case enclosed except as regards the top, where there are openings to allow the escape of moist air. It contains two tiers of steam-heated pipes, and directly over the top of each tier there is a row of iron rollers of small diameter set close together. At one end of the machine is a door for feeding wool into it, and at the opposite extremity is a spiked drum geared to rotate at a high speed. A fixed quantity of wool is fed into the machine at one time and placed on the lower series of rollers. These in their rotation carry the wool forward exposed to the heat of the pipes both above and below, till it reaches the drum, which, revolving rapidly, lifts it to the higher range of rollers. Over these the wool is carried back, till at the other end it again falls to the lower range, and so it circulates through the machine till the drying is completed. To withdraw the dried wool it is only necessary to raise the outlet door over the revolving drum, when it throws out the contents of the machine as fast as the wool comes within its range.

Teasing. The dried wool, notwithstanding the several manipulations to which it has been subjected, is still in the condition of matted locks, which have to be opened up and the whole material brought into a uniformly free and loose condition. This is effected in the Willey or teasing machine, which consists of a large drum and three small cylinders mounted in an enclosed frame. The drum is armed with ranges of powerful hooked teeth or spikes, and is geared to rotate with great rapidity, making about 500 revolutions per minute. The smaller cylinders, called workers, are also provided with strong spikes; they are mounted over the drum and revolve more slowly in a direction contrary to the drum, the spikes of which just clear those of the workers. The wool is fed into the drum, which carries it round with great velocity; but, as it passes on, the locks are caught by the spikes of the workers, and in the contest for possessing the wool the matted locks are torn asunder till the whole wool is delivered in a light, free, and disentangled condition.

Burring. For certain classes of dirty wool, notably such as that which comes from Buenos Ayres, still another preparing operation is essential at this stage—that is, the removal of burrs or small persistently adherent seeds and other fragments of vegetable matter which remain in the wool. Two methods of effecting this—one chemical, the other mechanical—may be pursued. The chemical treatment consists in steeping the wool in a dilute solution of sulphuric acid, draining off the dilute acid by means of the hydro-extractor, and then immediately exposing the wool to further rapid drying in a heat of about 250° F. The acid leaves the wool itself uninjured, but is retained by the more absorbent vegetable matter, and the high heat causes it to combine so energetically with the water left in the burrs that the vegetable matter becomes completely carbonized. The wool is thereupon washed in water rendered sufficiently alkaline to neutralize any free acid which may remain, and dried. The same burr-removing effect is obtained by the use of a solution of chloride of aluminium, a method said to be safer for the wool and less hurtful to the attendant workmen than is the sulphuric acid process. For mechanical removing of burrs, a machine something like the Willey in appearance is employed. The main feature of this apparatus is a large drum or swift armed with fine short spikes curved slightly in the direction in which it rotates. By a series of beaters and circular brushes the wool is carried to and fed on these short spikes, and in its rotation the burrs, owing to their weight, hang out from the swift. The swift as it travels round is met by a series of three burring rollers rotating in an opposite direction, the projecting rails of which knock the burrs off the wool. The burrs fall on a grating and are ejected, with, of course, a good deal of wool adhering to them, by another rotating cylinder.

Oiling. There remains yet another preliminary operation through which wool generally has to pass previous to the spinning processes. As delivered from the drying apparatus the wool is bright and clean, but somewhat harsh and wiry to the touch owing to the removal of the yolk which is its natural lubricant. To render it properly soft and elastic, and to improve its spinning qualities, the fibre is sprinkled with a percentage of oil, comparatively small quantities—by some spinners none—being used for worsted wools, but a larger amount being applied in the oiling of wool for woollen manufactures. The oil further has the advantage of producing a certain adhesiveness of the fibre in the spinning process, and thus it enables the spinner to get a more level and finer yarn, and it prevents loss from the flying off of separate fibres. As the oil is a costly item, it is of consequence that it should be equally distributed and used in a thrifty manner, for which end various forms of oiling apparatus have been devised, which sprinkle the oil in a very fine spray over thinly distributed wool carried by an endless cloth under the sprinkler. Gallipoli olive oil is the best medium for oiling combing wool; and for carding wool the liquid olein expressed from tallow and lard in the preparation of stearin is employed with advantage.

Blending. The raw material is now ready for the various spinning and other processes by which it is worked into useful forms; but pure wool of one quality alone is not generally used in the production of woven fabrics. For many reasons—among which cheapness figures prominently—wools are blended, and to no inconsiderable extent the added material consists of shoddy, mungo, or extract wools (see below). Blending with cotton is also practiced, and for some purposes silk and wool are mixed. The question of color as well as quality also determines blending operations, natural colored wools being frequently intermixed to obtain particular shades for tweeds, knitting yarns, etc. The various materials to be intermixed are bedded in due proportion in separate layers over each other, and passed through a teaser, from which they issue so intimately intermixed that they present a uniform appearance.

Woollen manufactures. The processes hitherto described—although woollen manufacture has been specially kept in view—are more or less essential to wool for all purposes to which it is applied. But from this point the manufacturing operations diverge into three main channels, which may be regarded as almost distinct textile industries. First and simplest we have the felt manufacture, in which cloth is made without either spinning or weaving; second is the woollen yarn and cloth manufacture, embracing the preparation of carded yarns and of cloth which is so milled or felted as to have the appearance of felt; and, thirdly, in the worsted yarn and cloth industry combed yarn is prepared and cloth showing the yarn and pattern is woven. These definitions must be taken to be accurate only in the broad general acceptation.

Felt. Felt is a kind of cloth made without spinning or weaving, but simply by the mutual adhesion of the imbricated fibres. The peculiar property is most distinctly developed in the short or carding wools, but all wool in common with mohair, alpaca, vicugna, and camel's hair, possesses it. Felting properties are also found in the hair of other animals; the rabbit, especially, supplies the finer felts used for hat-making, while the beaver hat, which is the ancestor of the modern dress hat, was a felt of beaver hair. Felted cloth is made by the combined influence of heat, moisture, and pressure or rubbing on a uniformly spread-out mass of woollen fibres. The wool is scribbled or carded out into a uniform lap of extreme thinness, but of a length and breadth sufficient for the size of the cloth to be made. A series of these carded laps are superimposed on each other till the requisite thickness of material is attained, and generally the two external laps are made of material superior to the body. The lap so prepared is passed on between a series of pairs of rollers, which press against each other partly immersed in a trough of water, the upper rollers being solid and heavy while those under are hollow and heated by steam. To the upper rollers a gentle reciprocating motion is communicated, so that the material is felted as it passes on. When duly condensed, the cloth, of leathery consistence, is dyed, printed, dressed, and finished when required, like ordinary woollen cloths. Felt has extensive applications, there being made from it druggets, carpets, table-covers, horse-cloths, etc.; the coarser varieties are used for boiler-covering and other mechanical purposes.

Woollens and worsteds.

It becomes necessary here to indicate the specific distinction of woollen and worsted yarns and cloth. In a general way it may be said that woollen yarns are those made from short wools possessed of high felting qualities, which are prepared by a process of carding, whereby the fibres are as far as possible crossed and interlocked with each other, and that these cardings, though hard spun on the mule frame, form a light fluffy yarn, which suits the material when woven into cloth for being brought into the semi-felted condition by milling which is the distinguishing characteristic of woollen cloth. On the other hand, worsted yarns are generally made from the long lustrous varieties of wool; the fibres are so combed as to bring them as far as possible to lie parallel to each other; the spinning is done on the throstle frame, and the yarn is spun into a compact, smooth, and level thread, which when woven into cloth, is not milled or felted. At all points, however, woollen and worsted yarns as thus defined overlap each other, some woollens being made from longer wool than certain worsteds, and worsteds being, when made from short staple wool, also carded as well as combed; and occasionally worsted yarn is spun on the mule frame, while milling or felting is a process done in all degrees,—woollen being sometimes not at all milled, while to some worsteds a certain milling finish is given. The fundamental distinction between the classes rests in the crossing and interlacing of the fibres in preparing woollen yarn,—an operation confined to this alone among all textiles, while for worsted yarn the fibres are treated, as in the case of all other textile materials, by processes designed to bring them into a smooth parallel relationship to each other.

Carding.

Woollen yarns as above explained, are exclusively made by the process of carding. The simple apparatus — the hand-cards — with which carding was done before the introduction of machinery and factory-work consisted of square or oblong pieces of board with handles, one face of the board being covered with card leather, which was closely studded with fine elastic steel teeth, pointed in one direction and bent as in Fig. 3. These teeth were strong or fine according to the nature, length, and strength of the fibre to be carded, but the finer the teeth the more closely were they studded together. A quantity of teased and oiled wool was placed on the surface of one card, which, taken in the left hand, was held teeth upward on the lap of the operator, while the other card, held in the right hand teeth downward, and consequently pointed in an opposite direction, was drawn from end to end over it, each card thus taking up a share of the wool which became entangled in its teeth. In this way, by drawing one card over the other repeatedly, the whole of the wool was ultimately separated and equally distributed over the pair of cards. The wool was then stripped out of the cards by drawing the teeth of one through those of the other in the direction of their inclination. The carded wool thus lifted out was condensed into a loose but uniform round pipe or "carding" by rolling on the back of the card and these cardings were then ready for spinning on the wheel.

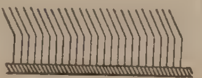

FIG. 3.—Card Teeth.

For the apparently simple operation of carding, the factory machinery is complex, delicate, and very expensive. Ordinarily it consists of three carding-engines, called respectively the scribbler, the intermediate, and the finisher, but sometimes the intermediate is omitted. In each of these there is a complicated series of card-covered cylinders of different diameters running at different rates of speed, sometimes in a contrary and sometimes in the same direction, which are engaged in contending with each other for the wool supplied to the machine, in abstracting it altogether from their neighbors, and passing it on to be again contended for and teased in the operation, and finally passed clean out of the machine. A sectional illustration (Fig. 4) of the first portion of a "scribbler" will serve as an illustration of the whole operation from beginning to end. The wool is entered to the apparatus by a travelling lattice, the supply being equalized and carefully distributed by a mechanical feed. It is caught between the lower two of a range of three feed rollers *a*, revolving immediately behind which is the "licker-in" roller *b*, which immediately takes possession of the portion of the feed which has fallen to the share of the lower or No. 1 feed-roller. The remainder of the feed is carried upward on the middle feed-roller, from which it is taken by the uppermost of the three rollers *a*, and from it the wool is delivered to the "licker-in." In this way a certain amount of preliminary blending and intermixing is accomplished. Against the licker-in revolves the "angle stripper" *c*, the function of which is to remove the wool from the former and to deliver it over to the great breast cylinder, which revolves at a high speed (surface velocity about ⅓ mile per minute). By the cylinder it is carried on till it comes against a small roller revolving slowly in the opposite direction, called "worker No. 1" *d*, which abstracts part of the wool, and carrying it round gives it up to the somewhat smaller roller, the "stripper" *e*, which again delivers it to the breast cylinder. Passing on it carries the wool partly to the second worker *f*, and stripper *g*, when the same operation is repeated. Continuing its progress, the cylinder with its covering of wool next comes in contact with the "fancy" *h*, the teeth of which are set so as to pass a little way into those of the cylinder. Its effect is to throw the wool partly out of its teeth and prepare it for being entirely removed by the "doffer" *i*, which is the next roller met by the cylinder, and which, like the "fancy," revolves in a contrary direction to the breast cylinder. The angle stripper *j* passes the wool from the doffer to the next cylinder, which is called a "swift," and which has the same workers, strippers, fancy, and doffer rollers as the breast cylinders. The scribbler contains three such sets of cylinders and rollers over which the wool passes till it is delivered. The intermediate carding-engine has two swifts, with relative workers, etc., and the finisher has also two swifts and a condenser. In some carding-engines the swifts are provided with more than two sets of workers and strippers. This is particularly the case in a class of carding-engines provided with only one swift or cylinder of very large diameter, around which there are five sets of workers and strippers (Fig. 5).

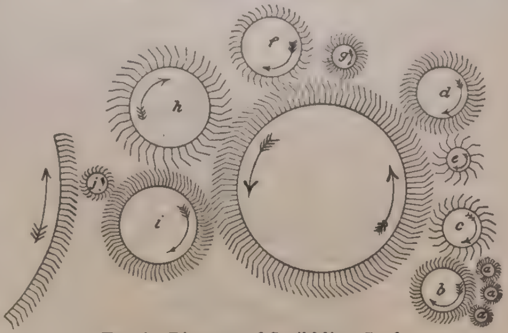

FIG. 4.—Diagram of Scribbling Card.

Condensing.

The carded wool, as it leaves the last swift of the finisher card, is in the form of a continuous equally-distributed lap. To prepare it for spinning, this lap must now be divided into a series of equal strips or ribbons, and these then condensed into a rounded carding or sliver sufficiently compact to bear winding on a bobbin. The condenser for doing this is attached to the finisher card, and consists of rings or bands of card-cloth, the width of the strips to be made, placed on one or on two cylinders, which rings doff the portion of the lap against which they revolve and yield it up to a stripper. These strips as they pass out are acted on by a pair of rubbers which, by a partly oscillating motion, rub the strip into the form of a carding of rounded loose untwisted fibres, which in the subsequent operation of spinning is easily drawn out to the degree of tenuity required in the yarn to be made.

Mule spinning.

The mule-frame employed for spinning woollen yarns is the same in principle as, but in some respects modified in action from, the spinning-mule used for fine counts of cotton yarn. The mule (Fig. 6) consists of a stationary frame on which the bobbins of sliver are placed, and of a carriage which travels back and forward a distance of in all about 2 yards from the stationary frame. The carriage contains in a horizontal row the spindles which give twist to the yarn and wind it on the bobbins or paper tubes fixed on them; and the complicated motions of the whole machine are regulated by gearing and belting from head-stocks on the stationary frame. The carriage being close up to the stationary frame, the ends of the slivers are passed through a pair of small giving-off rollers and attached to the bobbins or tubes in the carriage. The carriage then begins to travel back on its rails, the slivers being simultaneously delivered to it through the rollers, at the same rate at which it travels till, say, a yard length is given out, and as the carriage has been moving back the spindles have been revolving slowly so as to communicate some twist to the sliver; but up to this point there has been no drawing out or drafting. But now the rollers cease to give out sliver, the carriage continues travelling back, and the spindles revolve at a greatly increased rate, simultaneously drawing out the sliver and giving it the requisite twist, till, when it comes to the end of the rails over which it runs, the yard of original sliver is drawn out to 2 yards of yarn and twisted almost enough. The full twist is given while the carriage remains standing at the end; then the spindles are reversed two or three times to unwind a small proportion of yarn which the twisting operation leaves near the point of the bobbin; and lastly the carriage is run in to the stationary frame while the spindles wind the now finished yarn on the bobbins or tubes, an automatic arrangement securing due tension and the proper winding of the yarn.

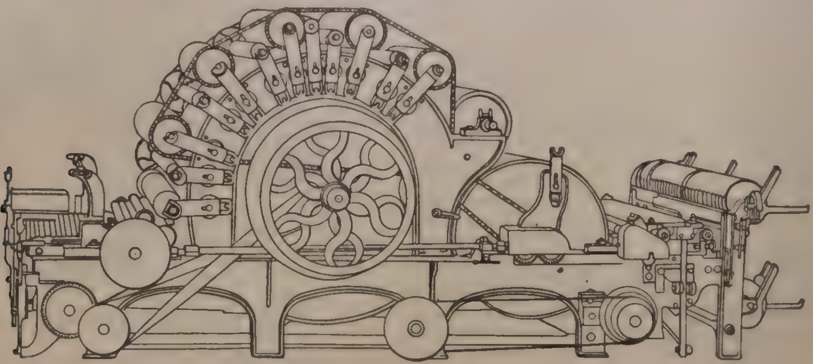

Fig. 5.—Single-Cylinder Carding Engine.

Woollen yarn.

Yarn, as delivered from the mule in woollen spinning, or from the throstle in the case of worsteds, is in the condition known as singles. For twisting the singles into yarn of two or more ply it is wound on bobbins; sometimes the bobbins from the spinning-frame are used direct, and placed on pegs in the twisting frame, which is a mechanism like the throstle, but without the arrangement for drafting. The twist is given in the reverse direction from that in which the singles are spun, and thereby the single is to some extent untwisted. Yarns of two-, three-, and five-ply and upwards are made; these are sometimes redoubled or again twisted together. The yarn may be made up of precisely the same singles; sometimes different counts or sizes of singles are twisted together; in other cases the colors may be different; and yet again yarns may be made of distinct fibres, such as wool and cotton, or wool and silk, etc. Numerous variations of the method of twisting are employed to produce loops, knots, and other irregularities in the yarn, for convenience in weaving and knitting fancy textures.

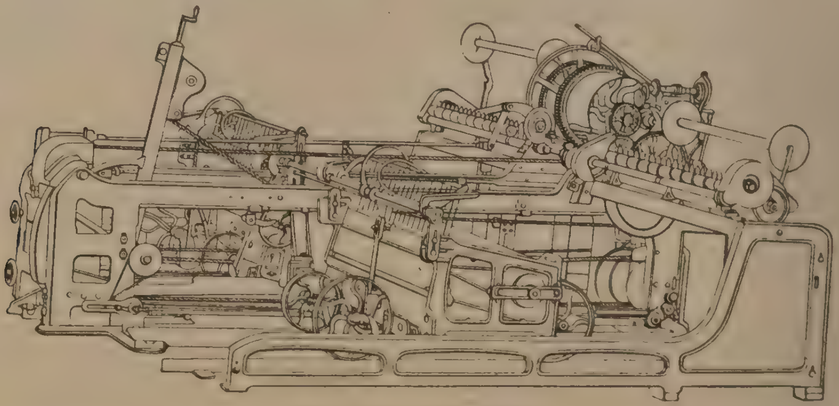

Fig. 6.—Wool Spinning Mule.

Worsted yarn.

If we adhere to the definition of worsted yarn which distinguishes it as being made from wool fibres brought as far as possible into a level parallel condition we shall have to do only with two methods of manufacture, (1) of yarn from long wool by the method of drawing, gilling, and combing, and (2) of yarn from medium and short staple wools, which are first carded and afterwards combed. But there is commonly added a third class of worsted yarns, worsted only in the sense that they are not meant for felting. These are carpet yarns and lightly twisted knitting yarns, which, being meant to be full and open in structure, are prepared for spinning by carding alone, precisely as in making woollen yarns.

Combing.

The primitive method of wool-combing, and the simple implements employed till comparatively recent days, when the ingenious machinery now used was invented, will serve to illustrate the problem of preparing long wool for spinning. The hand combs employed were studded with two—sometimes three—rows of long, smooth, rounded, and sharp-pointed steel spikes. The operative was provided with a pair of these combs. He had a comb-post to which he could attach them, and a comb-pot or small stove in which he heated the teeth of his combs and the wool which he worked. The teeth of one comb being duly heated he fixed it in the comb-post, and taking a quantity of wool previously oiled he dashed it in portions into the teeth of the comb and drew it through leaving a portion locked in the spikes, and this operation he continued till the comb was well filled with wool. Then he placed it in the comb-pot to heat up, while he similarly proceeded to fill the teeth of the second comb, which in the meantime had been heating. With both filled and duly heated, he took one comb in his left hand, laying it in his lap teeth upwards, and with the other in his right, he proceeded to comb out the locks, beginning first at the tips and working gradually in as the fibres were smoothed and opened out. In the end the combs were worked with teeth close up to each other and through the entire mass, the noils or short fibre being thus entirely combed out, excepting a small quantity left in the teeth which could not be reached by the opposing combs.

The typical modern process in worsted-yarn fabrication is that in which the preparation consists in gilling and subsequent combing, as practiced when long wool is the staple to be treated. The object of gilling is to bring all the fibres level and parallel to each other, and to prepare a uniform sliver for the subsequent combing operation. The gilling-machine or gill-box (Fig. 7) in its essential features consists first of a pair of rollers to which the wool is fed. Beyond these it is caught by rows of steel pins fixed in heavy steel bars, termed fallers, which rise in close and constant succession immediately behind the feed-rollers, penetrate the wool presented to them, and travel forward with it towards a second pair of rollers which catch the fibre and draw it away. The spike-covered fallers are so called because they travel from one to the other pair of rollers, carried forward by endless screws into which they are threaded, then, falling down, are returned by the action of similar screws operating in the opposite direction, till just under the feed-rollers they rise again to catch the feed of wool, and so continue to circulate. There is thus a continuous line of fallers travelling between feed-rollers and back rollers, but as the back rollers revolve much more quickly than the front rollers, and also draw the wool through them more rapidly than it is presented to them by the fallers, there is a constant and steady drawing of wool away from the front rollers and through the teeth of the fallers, and this draught tends to cause all the fibres to arrange themselves in the direction in which they are being gently dragged. A set of gill-boxes consists of five or six machines constructed on the same principle, but with the pins of the fallers finer and more closely studded as the fibre travels on and as the orderly and symmetrical arrangement of the sliver increases. From the first two or three machines the wool is generally delivered as a broad lap, and it is similarly presented to the next, but in the later boxes the product is condensed into a sliver, which is received in large cylindrical tin cans. Six of these cans are brought to the front of the next gill-box, and the six slivers are, in passing through, drawn into and delivered as one, and, such an operation being repeated three times, it will be seen that any original portion of sliver must be distributed over a great length, and in this way the fibres are brought even with each other and a very level and uniform strand is produced. In the original form of gill-box the fallers travelled from front to back at a uniform speed, and thus all the draughting was done by the rapid rotation of the back rollers. Now, by a graduated pitch in the screws which carry the fallers forward, they travel at a steadily accelerated rate, beginning slow, and reaching their greatest rapidity just as they deliver the wool to the back rollers, which revolve still more rapidly. Thus there is steady draughting throughout the whole range of the machine, and the wool is at once more gently treated and more uniformly drawn out than in the old forms of the machine.

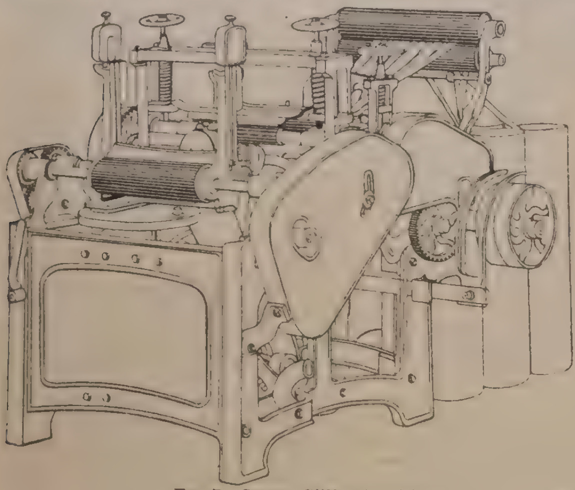

FIG. 7.—Screw Gilling Machine.

It will be obvious that the gill-boxes through which long wool passes, while possessing the power of bringing the fibres into a smooth, equal, and regular condition, do nothing in the way of selecting and separating out the long and straight from the short and curly fibres which are always intermixed. To obtain an even and smooth worsted yarn it is necessary to effect this separation, and it is the function of the various forms of combing machine now in use to separate the "top" or long fibre from the "noil" or short and broken wool, and to deliver the former as a continuous sliver of uniform size. The invention of a successful combing machine has been the great triumph of the modern worsted industry, and the introduction of the apparatus led, as is commonly the case with all great inventions, to a vast amount of dispute and litigation, and many conflicting claims of merit. About 1840 at least three investigators were separately at work on the problem—Mr. S. C. Lister of Bradford, Mr. Donisthorpe of Leicester, and M. Heilmann of Alsace. Messrs. Lister and Donisthorpe conjointly secured a patent for a combing machine, in connection with which they entered into partnership, but their patent rights were successfully disputed by Heilmann under a patent granted to him in 1847, and they were obliged to buy up his invention for £30,000 [$145,800]. Since that time much attention has been given to combing machinery, not for wool alone, but also for spun silk and cotton; and now there are many varieties of apparatus in the market for doing what not very long ago was pronounced to be utterly impracticable. The three principal classes of machine at present used for wool-combing are: (1) the Lister or nip machine, which is most suitable for long combing wools, mohair, and alpaca; (2) the Noble or circular comb, principally useful for combing shorter staple or intermediate wools; and (3) the Holden or square-motion comb, which is applicable for short staple wools. It is impossible here to convey a full conception of the delicate almost intelligent manner in which these machines work. A principal feature of them is a large ring or circle studded with rows of fine steel pins, which is made to revolve horizontally within the machine. By various devices the wool is fed into the teeth of the ring in a continuous series of tufts with its ends overlapping the edge of the ring as it revolves. In the case of the nip machine the wool is fed in by fallers as in the gill-box. The end of the sliver is caught by a nip which tears a tuft through the pins of the fallers, and thus partly combs it out. This tuft the nip places on the teeth of the revolving circle, by which it is carried on till it comes to a pair of upright rollers revolving close to the edge of the circle. These rollers catch between them the ends of the long fibre and draw it out of the teeth of the circle in a continuous sliver as it revolves. The Noble or circular comb is provided with three pinstudded rings, one large and two small, the latter being so centred within the larger ring that in rotating their outer edges just meet the inner edge of the large ring which rotates around them. The tufts of wool are dabbed down over the pins of the larger and smaller circles at the points where they meet, and of course as they rotate the teeth immediately begin to draw apart, and the wool is divided, the long fibres hanging over the edge of each circle. These fibres are caught between upright rollers, which thus deliver four continuous slivers of top, and leave the noil to be otherwise lifted out of the teeth.

Drawing.

The sliver as delivered from the combing machine is made up into a ball by a balling gill-box, behind the back rollers of which instead of a can there is a large bobbin for receiving the sliver, which is wound on it in a diagonal manner from the oscillating rotation given to the bobbin. Such balls of sliver then undergo the operation of drawing, the purpose of which is still further to equalize the strand of fibre, and to bring it into a sufficiently attenuated form for spinning. The principle of drawing or draughting consists in presenting the sliver to a pair of receiving rollers which pass it on to a pair of delivery rollers, which rotate proportionately faster than the receivers, and to that extent draw out and attenuate the sliver. Supposing the wool to pass through six such drawing frames, six slivers may be fed into the first and drawn out to the dimensions of one; the same may be repeated in the second, five slivers may be reduced to one in the third, four to one in the fourth and fifth frames; and in the roving frame, in which a little twist is given to the sliver before it is wound on a bobbin, two slivers may be elongated into one. Thus we have any length of sliver drawn out $6 \times 6 \times 5 \times 4 \times 4 \times 2 = 5760$ times its original extension, and with increase of frames this extension multiplies enormously. Treating the slivers in nine drawing frames, we may have $8 \times 6 \times 5 \times 5 \times 5 \times 4 \times 3 \times 2 \times 2 = 288,000$ of extension.

Carded worsted.

Short and medium staple wools are carded before being gilled and combed. The preliminary operations differ in no way from those employed for woollen yarns. After carding the wool is generally washed, previous to gilling in a back washer. The machine consists of two sud bowls or vats provided with immersers and squeezing rollers through which the cardings are passed; then they are carried round two copper cylinders internally heated by steam, from which they are passed on and delivered by the fallers of a gilling apparatus.

The bobbins of elongated and slightly twisted rovings are now ready for spinning on the throstle spinning-frame,

Throstle spinning.

on which it is simultaneously drawn out to its ultimate tenuity, twisted, and wound on a bobbin. The drawing out is done practically by the same device as the drafting of sliver in the drawing-frame. The bobbins of rove are placed on pegs on the frame slightly canted forward, so that the roving as drawn off comes away at right angles from the bobbin. The rovings pass first between a pair of rollers, and are carried on and supported by small carrier rollers till they reach a front pair of rollers, the upper of which is covered with leather and the lower grooved or furrowed. The space between the back and front pairs of rollers, termed the ratch, is that in which the final drawing is effected, and the amount of attenuation effected is dependent on the relatively faster rate at which the front rollers rotate as compared with the back pair. Immediately the slender cord has passed the front pair of rollers, twist is imparted to it by the spindle working either on the old flyer principle, on the cup principle, or with the more recent ring and traveller. See also YARN. The doubling and subsequent treatment of worsted singles are the same as in the case of woollen yarn singles from the mule frame.

Shoddy and mungo.

The term shoddy was formerly one of some opprobrium in connection with woollen manufactures, but the substance is now frankly recognized as a material of great utility for many purposes when body and warmth are more essential than toughness or elasticity. Shoddy consists of rags and shreds of stockings, flannels, and other soft worsted fabrics torn and reduced to such fragments of the original fibre as can be made by the operation. Mungo is a similar preparation made from rags, and from shreds and clippings of milled woollen cloths, being divided into new mungo made from tailor's waste, and old mungo from rags of all degrees of degradation. Extract wool is that which is recovered from rags of various cloths in which cotton and wool are variously woven together. The wool is freed from the cotton by the same chemical or carboning process which is employed in freeing dirty wool from burrs, viz., by treating the union fabric with a solution of sulphuric acid and heating it in a stove, when the acid energetically attacks and chars the vegetable fibre, leaving the wool unharmed. Shoddy and mungo are prepared by dusting the rags and fragments, classifying them according to color and quality, picking out seams, oiling the material, and then passing it into a machine significantly called the "devil," which literally rends the rags, etc., to fragments, which look more like dust than fibres, by the exceedingly rapid rotation of a swift or large cylinder armed with powerful iron spikes, with equally strong toothed rollers revolving in an opposite direction. Into the same category with these come the flocks formed in the various processes of finishing cloth, which are, of course, even shorter than the others. Indeed the shoddy manufacturers hold that "anything long enough to have two ends" is sufficient for manufacturing purposes. The shoddy trade was begun in Batley, Yorkshire, by Mr. Benjamin Law in 1813, and, notwithstanding the disfavor with which it was long viewed, it prospered and developed till the shoddy district of Batley, Dewsbury, and their surroundings became the centre of a great and prosperous branch of the woollen trade entirely dependent on these disintegrated materials. It is said that as much as 125,000,000 ℔ of shoddy material is now yearly worked up into cloth in England alone. Shoddy, etc., cannot be used without a due proportion of natural-length wool, usually one-third of pure wool being employed in spinning shoddy yarn; but sometimes as much as 80 per cent. of the finished cloth consists of shoddy. It finds its way into a very large proportion of woollen goods, but its use is detrimental where tenacity and wear are required. For linings, rugs, wraps, and heavy friezes, pilots, druggets, blankets, etc., in which bulk and warmth more than wear-resisting qualities are required, it is suitable, and it also makes into good light milled cloth for ladies' jackets. Shoddy is practically a new source of textile material; its employment is a utilization of waste, and furnishes cheap serviceable textures.

Cloth finishing.

For the dyeing and weaving of woollen and worsted fabrics the reader is referred to the separate articles relating to these processes. But a piece of cloth—woollen cloth especially—as it comes from the loom is very far from being a finished product. Indeed the most characteristic operations in woollen-cloth manufacture are subsequent to the weaving stage. Woollen cloth from the loom, called "roughers," has an irregular, slack aspect, very different from the same web when it comes to be sold as, say, broadcloth. The web as it leaves the loom is still saturated with the oil with which it was sprinkled before spinning, and impregnated with the size applied to the yarn to give it tenacity and consistency in weaving. To remove these it is scoured with hot soapsuds in a trough having a convex bottom, and fitted with wooden mallets which are made to fall obliquely against the cloth. After being scoured in this way, it is stretched in a frame for burling or perching, an operation which consists in going carefully over the whole web, picking out all burrs and knots in the texture, and darning up holes and open spots which it may show.

Fulling.

Fulling is the one process which is specially distinctive of woollen textures,—its results being shown in the highest degree in broadcloths, doeskins, and other like goods. Every one knows how flannels, blankets, and hosiery tend to contract with frequent washing, gaining in thickness and solidity what they lose in extension and elasticity; such shrinking is greatly accelerated when woollen articles are much rubbed in very hot water. This shrinking or fulling is, as already explained, the result of the serrated wavy structure of wool. The operation of fulling or milling is performed in the fulling stocks, or in the more modern milling-machine; but, by whatever agency carried out, the effect is always the same. The old method of fulling by the stocks is wasteful of power, and the blows the stocks give tend sometimes to tear the cloth, drawbacks from which the milling-machine is comparatively free. The cloth to be fulled is well saturated with hot soap and water, and either worked under the falling weight of the stocks or pressed and rubbed between rollers in the milling-machine while so heated and soaped. The more prolonged the operation the more does the material shrink up and thicken, and a piece of cloth may even be milled till it is reduced to half its original length and breadth. The degree of fulling is a distinctive feature of many different varieties of cloth. In the treatment of broadcloth, doeskins, meltons, and all nap-finished cloth, the milling is carried so far that the fibres become densely matted, obliterating the appearance of weave, and giving the piece more the aspect of felt than of cloth. Fabrics such as Venetian cloths, and diagonals, etc., to which no pile-finish is given, are milled only to the extent of solidifying and increasing the substance and strength of the texture, and tweeds are only very slightly felted to give them a dressed surface. On the conclusion of the fulling operation the goods are scoured to free them from soap, which is very simply done by gradually supplanting the soapsuds with pure water, which is tepid at first but is gradually cooled by additions till in the end the cloth is being worked in pure cold water.

Teasling.

The cloth that is taken from the fulling-machine must immediately be stretched uniformly in all directions by hooks on a frame, so that it may dry evenly without wrinkle or curl. The frame may be placed in a hot-air chamber to hasten the drying, or the cloth may be allowed to dry under ordinary atmospheric conditions. In this operation a pile or nap is raised on the surface of milled cloth. The raising of the pile is effected by the agency of the flower-head of the teasle (*Dipsacus fullonum*), which forms a cone-like spike covered with imbricated scales. These scales end in sharp, recurved hooks, possessed of high elasticity, combined with just sufficient stiffness for the work they have to do. The use of these hooked teasles is to scratch the surface of the milled cloth, and getting entangled with minute surface fibres break these or pull out their ends, and so raise over the whole surface a fine but unequal nap. Formerly the teasles were set together in a flat frame, and by hand the workmen brushed them in a uniform manner over the whole surface of the tightly stretched cloth. But this laborious handicraft has long been superseded by the use of the gig-mill or dressing-machine. This apparatus consists of a cylinder made to rotate at a high rate of speed. The surface of the cloth to be raised is, in a state of uniform tension, brought in contact with the revolving cylinder. An automatic arrangement in the machine regulates the lightness or closeness of contact of cloth and teasles. The myriads of elastic hooks scratch the entire surface, disengaging and opening up short fibres, and thus covering the whole with a nap. There are, however, several varieties of pile desired in dressing woollen cloths, and a pile may be raised in a certain class of fabrics for a purpose quite the opposite of that for which other piles are formed. Thus in cloth dressing the object is to get a glossy and smooth nap which quite covers and conceals the underlying structure, while tweeds and similar goods are teasled with the view of ultimately removing all pile from the surface and leaving the pattern of the cloth well defined and free from all hairiness. Pile-dressed fabrics are raised by the wet method: that is, the cloth to be operated upon in the dressing-machine is first damped, and the nap so produced lies smooth, flat, and level in one direction, covering the surface in much the same way as short hairs cover the skin of an animal. Cloth raised dry, on the other hand, throws its fibre ends straight out from the cloth, the action indeed being a kind of combing-up of all the more loose and open surface fibres so as to prepare them for being entirely cropped or shorn off in order to leave the fabric with a clean, bare surface. Metallic teasles have frequently been suggested and to some extent employed as a substitute for the vegetable product, but hitherto such devices have not proved quite satisfactory.

Cropping.

The operation of cropping was also formerly a handicraft, the worker using a huge pair of shears, and the employment demanded much dexterity and skill to produce a uniform smooth pile or a well-cleaned surface. It is now done with equal rapidity and certainty by a machine which in principle is the same as the lawn-mower. It consists of a cylinder armed with a series of helical knives or cutters, the cylinder revolving with great velocity against the smooth stretched surface of the cloth, partly cutting away and partly tearing off the tips of the projecting fibres which come within the range of its ledger-blades. Four hundred years before the practical introduction of this helical cropping machine, it was invented and proposed for modern use by Leonardo da Vinci.

Pressing.

With the view of giving lustre to the finished cloth, it is, when taken from the cropping machine and brushed on the brushing machine to remove the flocks produced in shearing, wound tightly round a huge drum, and boiled, or rather immersed in water heated to from 160° to 180° F., for three or four hours. It is then unwound, the ends are reversed, winding first on the roller the end which was on the outside in the previous boiling, and again boiled. Finally it is pressed in an hydraulic press, in which the cloth is heated either by the introduction of hot iron-plates between the folds or by forcing steam through it in the press, this last process adding to the solidity and smoothness of the cloth and developing the lustre characteristic of a well-finished fabric.

Manufactures in wool.

The range and variety of cloths and other textures made from wool are exceedingly great. Under the heading of cloth manufactures, there may be enumerated, of piled cloths, broad-cloths, doeskins, cassimeres, meltons, beavers, and friezes. Of cloths milled and cropped bare there are venetians, sataras, and diagonals, which differ in the arrangements of warp and weft in the weaving. Tweeds, which form an important item, are cloths only slightly felted, raised dry, cropped, and pressed. The variety of worsted cloths is still greater, embracing says, serges, sateens, repps, merinos, mousselaines-de-laine, tartans, camlets, Russell cords, coburgs, lastings, delaines, and Orleans cloth. Hosiery forms a manufacture apart, as do also the processes of making carpets, blankets, flannels, shawls, rugs, and wrappers, curtain-cloths, and alpaca and mohair textures.

As an illustration of the advantages which have resulted from the application of machinery to the many and complicated processes of cloth manufacture, it has been calculated by M. Alcan that, whereas in the 17th century the labor of more than 10,000 men was needed to produce in one day a ton of cloth from a ton of wool, that amount of work now can be done in one day by about 1900.

Trade.

Wherever civilized mankind dwell there is found wool production, with more or less of woollen manufacture. This fact notwithstanding, the cultivation of wool tends to become increasingly associated with special localities, and from age to age different regions enter into competition as sources of wool, and the great sources of supply correspondingly change their position. Neglecting the produce of Britain, which probably has not varied to any notable extent during the century, though its movement as an article of export has developed greatly in that interval, we may briefly note the vast developments which have taken place in some sources of supply. In 1800 most of the wool, other than that from native sources, used in England came from Spain. In 1810 167 ℔ was imported from the Australian colonies, and now the imports from these colonies reach 400,000,000 ℔ yearly, and the imports from Spain have dwindled to 1,700,000 ℔. Similarly the quantity brought from the Cape of Good Hope has grown from about 30,000 ℔ in 1820 to 61,250,000 ℔ in 1886. The growth and fluctuation in the imports from these and other regions are exhibited in Table I.

Imports of wool.

TABLE I.—*Imports of Wool into the United Kingdom from the Principal Countries, Foreign and Colonial (given in thousands of lbs.).*

	Spain.	Germ'ny	Australia.	South Africa.	East Indies.	Total from all Countries.
1800	6,062	412	...	...	...	8,609
1810	5,592	778	167	...	...	10,914
1820	3,536	5,113	99	30	...	9,775
1830	1,643	26,073	1,967	33	...	32,305
1840	1,266	21,812	9,721	751	2,441	49,436
1850	440	9,166	39,018	5,709	3,473	74,326
1860	1,000	9,954	59,166	16,574	20,214	151,218
1870	25	4,406	175,081	32,785	11,143	263,250
1880	1,580	7,174	300,627	51,386	29,190	463,309
1886	1,710	3,281	401,426	61,257	34,597	615,998

Exports of wool.

The exports of raw wool have risen in fairly steady proportion to the imports, springing up from 92,542,384 ℔ in 1870 to 311,902,741 ℔ in 1886, the average excess of the imports over the exports each year being from 200,000,000 to 230,000,000 ℔.

Factory employment.

Table II exhibits the relative position and progress of the principal textile manufactures in the United Kingdom at various periods:

TABLE II.

Description of Factories.	Persons Employed.				Power Looms.			
	1838.	1856.	1870.	1878.	1836.	1856.	1870.	1878.
Cotton...	259,104	379,213	450,087	482,903	108,751	298,847	440,676	514,911

Export of manufactures.

The growth of the export trade from the United Kingdom in woollen and worsted manufactures from 1820 is exhibited in the subjoined table (in thousands of pounds sterling):

TABLE III.

	Manufactured Goods.	Woollen and Worsted Yarns.	Total Woollen and Worsted Exports.		Manufactured Goods.	Woollen and Worsted Yarns.	Total Woollen and Worsted Exports.
1820	5,586	...	5,586	1857	10,703	2,943	13,646
1830	4,728	122	4,851	1865	20,141	5,100	25,241
1840	5,327	452	5,780	1870	21,665	4,994	26,659
1850	8,588	1,451	10,040	1880	17,265	3,345	20,610

The following is the detailed statement of exports from the United Kingdom from the Board of Trade Returns for 1887:

TABLE IV.

	Quantities.	Value.
Woollen and worsted yarns........	40,165,100 ℔.	£3,970,205
Coatings, all wool........................	17,175,900 yds.	3,843,872
Do., mingled with other materials..	29,057,500 yds.	3,682,913
Woollen stuffs................................	49,582,300 yds.	2,311,107
Worsted coatings...........................	10,038,800 yds.	1,832,072
Worsted stuffs................................	151,362,000 yds.	5,113,191
Flannels..	10,925,000 yds.	416,307
Carpets..	12,980,300 yds.	1,310,241
Blankets...	1,578,912 pairs.	545,576
Hosiery	...	734,691
Small wares and unenumerated	...	794,539
Total...............	...	£24,551,714
Alpaca and mohair yarn............	12,196,100 ℔.	£1,081,971

Centres of industry.

Particular districts have attained a predominant hold on certain branches of the manufacture, and with great tenacity the industries have clung for long periods to the districts which have succeeded in establishing a reputation for the branches they cultivated. In this way the manufacture of superfine broadcloths has been long associated with the West of England, specially with Wiltshire and Gloucestershire, and in that district the trade in fine cloth is still chiefly centred. In point of quantities produced, however, and of persons employed, the West Riding of Yorkshire woollen cloth districts far outstrip the West of England, and are the true centres of all industries connected with wool. Of woollen cloths of all kinds the towns of Leeds and Huddersfield are the most important producers. The shoddy trade has been specially developed at Batley and Dewsbury, and the numerous manufactures of worsted have their principal centre in Bradford and the populous district surrounding it. Norwich, at one time the capital of worsted manufactures, and a large producer of shawls, thanks to the immigration of Flemings, has entirely lost its supremacy, probably owing to the superior coal facilities of Yorkshire, but it is yet the seat of no inconsiderable worsted manufacture. The hosiery trade is developed chiefly in and around Leicester, and at Kilmarnock the allied knitting of bonnets is a specialty. Flannels and blankets are associated with Wales; the carpet trade belongs principally to Kidderminster, Halifax, Glasgow, and Kilmarnock. Shawls are made in Paisley, Alva, and Alloa in Scotland, knitting-yarns being a largely developed industry in the two last-mentioned towns. Tweeds are the special industry of Hawick, Galashiels, Dumfries, and Aberdeen, and also form an important part of the manufactures of Leeds.

(J. PA.)

WOOLLETT, William (1735–1785), engraver, was born at Maidstone, of a family which came originally from Holland, on August 15, 1735. He was apprenticed to John Tinney, an engraver in Fleet Street, London, and he also studied in the St. Martin's Lane academy. His first important plate was from the Niobe of Richard Wilson, published by Boydell in 1761, which was followed in 1763 by a companion engraving from the Phaethon of the same painter. After West he engraved his fine plate of the Battle of La Hogue (1781), and the Death of General Wolfe (1776), which is usually considered Woollett's masterpiece. In 1775 he was appointed engraver-in-ordinary to George III.; and he was a member of the Incorporated Society of Artists, of which for several years he acted as secretary. He died in London May 23, 1785.

In his plates, which unite work with the etching-needle, the dry-point, and the graver, Woollett shows the greatest richness and variety of execution. In his landscapes the foregrounds are distinguished by depth and vigor, the distances by the utmost tenderness; and his rendering of water is particularly excellent. In his protraits and historical subjects the textures are varied and well discriminated, and the rendering of flesh is characterized by great softness and delicacy. His works rank among the great productions of the English school of engraving. Louis Fagan, in his *Catalogue Raisonné of the Engraved Works of William Woollett* (1885), has enumerated 123 plates by this engraver.

WOOLSORTER'S DISEASE (Anthrax, Anthracæmia, Charbon, or Malignant Pustule) is the term applied to a virulent acute malady occasionally occurring in workers in the wool or hair, as well as in those handling the carcasses, of animals, chiefly sheep and oxen, which had been affected with splenic fever. The disease, as it is seen in animals, has been described in the article Murrain (*q.v.*). The present notice refers only to the malady in man.

For many years cases of sudden death had been observed to occur from time to time among healthy men engaged in woollen manufactories, particularly in the work of sorting or combing wool. In some instances death appeared to be due to the direct inoculation of some poisonous material into the body, for a form of malignant pustule was observed upon the skin; but, on the other hand, in not a few cases without any external manifestation, symptoms of blood-poisoning, often proving rapidly fatal, suggested the probability of other channels for the introduction of the disease.

In 1880 the occurrence of several such cases among woolsorters at Bradford, reported by Dr. Bell of that town, led to an official inquiry by the Local Government Board, and an elaborate investigation into the pathology of the disease was at the same time conducted at the Brown Institution, London, by Professor Greenfield.

Among the results of this inquiry it was ascertained —(1) that the disease appeared to be identical with that known by the name of splenic fever or anthrax occurring among sheep and cattle; (2) that in the blood and tissues of the body was found in abundance, as in the disease in animals, the *bacillus anthracis*, which is held to be the infecting agent in communicating the malady; and (3) that the skins, hair, wool, etc., of animals dying of splenic fever retain this infecting organism, which, under certain conditions, finds ready access to the bodies of the workers.

Two well-marked forms of this disease are recognized, external anthrax and internal anthrax. In external anthrax the infecting agent is accidentally inoculated into some portion of skin, the seat of a slight abrasion, often the hand, arm, or face. A minute swelling soon appears at the part, and develops into a vesicle containing serum or bloody matter, and varying in size, but seldom larger than a shilling. This vesicle speedily bursts, and leaves an ulcerated or sloughing surface, round about which are numerous smaller vesicles which undergo similar changes, and the whole affected part becomes hard and tender, while the surrounding surface participates in the inflammatory action, and the neighboring lymphatic glands are also inflamed. This condition, termed malignant pustule, is frequently accompanied with severe constitutional disturbance, in the form of fever, delirium, perspiration, together with great prostration and a tendency to death from septicæmia, although on the other hand recovery is not uncommon. It was repeatedly found that the matter taken from the vesicle during the progress of the disease, as well as the blood in the body after death, contained the *bacillus anthracis*, and when inoculated into small animals produced rapid death, with all the symptoms and post-mortem appearances characteristic of splenic fever.

In internal anthrax there is no visible local manifestation of the disease, and the infecting material appears to gain access to the system from the air charged with it, as in rooms where the contaminated wool or hair is unpacked, or again during the process of sorting. The symptoms usually observed are those of rapid physical prostration, with a small pulse, somewhat lowered temperature (rarely fever), and quickened breathing. Examination of the chest reveals inflammation of the lungs and pleura. In some cases death takes place by collapse in less than one day, while in others the fatal issue is postponed for three or four days, and is preceded by symptoms of blood-poisoning, including rigors, perspirations, extreme exhaustion, etc. In some cases of internal anthrax the symptoms are more intestinal than pulmonary, and consist in severe exhausting diarrhœa, with vomiting and rapid sinking. Recovery from the internal variety, although not unknown, is more rare than from the external, and its most striking phenomena are its sudden onset in the midst of apparent health, the rapid development of physical prostration, and its tendency to a fatal termination despite treatment. The post-mortem appearances in internal anthrax are such as are usually observed in septicæmia, but in addition evidence of extensive inflammation of the lungs, pleura, and bronchial glands has in most cases been met with. The blood and other fluids and the diseased tissues are found loaded with the *bacillus anthracis*, and inoculation experiments, such as those already referred to, produced similar results.

Treatment in this disease appears to be of but little avail, except as regards the external form, where the malignant pustule may be dealt with early by strong caustics to destroy the affected textures. For the relief of the general constitutional symptoms, quinine, stimulants, and strong nourishment appear to be the only available means. As preventive measures in woollen manufactories, the disinfection of suspicious material, or the wetting of it before handling, is recommended as lessening the risk to the workers.

WOOLSTON, Thomas (1669–1731), English deist, born at Northampton in 1669, was the son of a "reputable tradesman," entered Sidney College, Cambridge, in 1685, studied theology, and was made a fellow of his college. Whiston states that he "was in his younger days a clergyman of very good reputation, a scholar, and well esteemed as a preacher, charitable to the poor, and beloved by all good men that knew him." After a time, by the study of Origen, he became possessed to fanaticism bordering on insanity, with the notion of the importance of an allegorical interpretation of Scripture, and advocated its use in the defence of Christianity both in his sermons and in his first book, *The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Revived* (1705). For many years he published nothing, and was left to pursue his allegorical fancies in peace. But in 1720–21 the publication of letters and pamphlets in advocacy of his notions, with open challenges to the clergy to refute them, brought him into trouble. It was reported that his mind was disordered, and Whiston states that his college allowed him his fellowship, though not in residence, on account of his illness, but that when he appeared at college to prove that he was well he was ordered to go into residence. On his refusing to do this his fellowship was taken from him (1721). Whiston interceded for him in vain, "the clamor against him running so high." In the "Life" prefixed to the collected edition of his works, his non-residence is described as only "a pretence for depriving him." From 1721 he lived for the most part in London, on an allowance of £30 [$147] a year from his brother and other presents. He continued to publish bitter and scurrilous pamphlets against the clergy and the advocates of the literal sense of Scripture. His influence on the course of the deistical controversy commenced with his book, *The Moderator between an Infidel and an Apostate, or the Controversy between the Author of the Discourse of the Grounds and Reasons of the Christian Religion and his Reverend Ecclesiastical Opponents Set in a Clear Light* (1725, 3d ed. 1729). The "infidel" intended was Anthony Collins, who had maintained in his book alluded to that the New Testament is based on the Old, and that not the literal but only the allegorical sense of the prophecies can be quoted in proof of the Messiahship of Jesus. Woolston interposed as umpire in the controversy thus started, and, passing from the evidence from prophecy, which alone he allowed, opened the great debate on the evidential value of the miracles of Christ. He denied absolutely the proof from miracles, called in question the fact of the resurrection of Christ and other miracles of the New Testament, and maintained that they must be interpreted allegorically, or as types of spiritual things. Two years later he commenced a series of *Discourses* on the same subject, in which he applied the principles of his *Moderator* to the miracles of the Gospels in detail. The *Discourses*, 30,000 copies of which were said to have been sold, were six in number, the first appearing in 1727, the next five 1728–29, with two *Defences* in 1729–30. The publication of the *Moderator* drew upon him a prosecution by the attorney-general in 1726 for blasphemy and profaneness, which was suspended in consequence of Whiston's intercession. But the appearance of the first four of his *Discourses* caused the renewal of the prosecution, and on March 4, 1729, the trial ended in his being found guilty of the alleged crime. He was sentenced (Nov. 28) to pay a fine of £25 [$122.50] for each of the first four *Discourses*, with imprisonment till paid, and also to a year's imprisonment and to give security for his good behavior during life, namely, to be bound himself in a recognizance of £2000 [$9800] and two securities of £1000 [$4900] each, or four of £500 [$2450] each. He failed to find this security, and remained in confinement until his death, though he mitigated its severity by purchasing the liberty of the rules of the King's Bench. Dr. Samuel Clarke solicited at court for his release, but Woolston's death anticipated any results of his efforts. He died in prison January 21, 1731.

In his attack on the miracles Woolston does not raise the general philosophical question of their possibility, but confines himself to the task of seeking to prove that the accounts of them as given in the Gospels are, when taken literally, full of contradictions, absurdities, and incredibilities, and that they must therefore be interpreted as allegory, and emblems of Christ's more mysterious work. In his view, however, that work of Christ appears to be nothing more than to teach the mystical sense of the Old Testament, the best part of which is the "simple golden religion of nature." He evidently had formed to himself no clear theory of the origin of the accounts of the miracles, sometimes ascribing them to the fancy of the writers, sometimes to deliberate invention, and he does not seek to harmonize any such view of them with their emblematic character, of which he is such a fanatical advocate. Whiston remarks, probably with truth, "When Woolston died he hardly knew himself whether he believed the Christian religion or not." Though it cannot be denied that he anticipated, in some of his criticisms of the details of the miraculous narratives, many points since urged by Reimarus, Strauss, and others, he nowhere exhibits the least soundness of judgment, historical sense, or consistency of thought, while his language and illustrations are coarse and offensive in the extreme.

Upwards of sixty more or less weighty pamphlets appeared in the next few years in reply to his *Moderator* and *Discourses*. As amongst the abler and most popular of them may be mentioned Dr. Z. Pearce's *The Miracles of Jesus Vindicated*, 1729; Sherlock's *The Tryal of the Witnesses of the Resurrection of Jesus*, 1729, 13th ed. 1755; and Lardner's *Vindication of Three of Our Saviour's Miracles*, 1729, Lardner being one of those who did not approve of the prosecution of Woolston (see Lardner's Life by Kippis, in Lardner's *Works*, vol. i.).

See Life of Woolston prefixed to his *Works* in five volumes, London, 1733; *Memoirs of Life and Writings of William Whiston*, London, 1749, pp. 231–35; Appendix to *A Vindication of the Miracles of our Saviour, etc.*, by J. Ray, 2d. ed. 1731; Lechler's *Geschichte des Englischen Deismus*, 1841; Leland's *View of the Principal Deistical Writers*, 1734; Leslie Stephen's *History of English Thought in 18th Century*, ch. iv.; Cairns's *Unbelief in the Eighteenth Century*, 1880; Sayons's *Les Déistes Anglais*, 1882.

WOOLWICH, a parliamentary borough and garrison town of Kent, England, is situated chiefly on the south bank of the Thames, on the declivity of Shooter's Hill, which slopes downwards to the river, 10 miles from Charing Cross by rail and 12 by steamer. The town is irregularly built, with narrow streets, and for the most part mean-looking houses. The spacious level at the summit of the hill is known as Woolwich Common. The feature of Woolwich is the Royal Arsenal, at which the number of men usually employed is about 10,000. It occupies an area of 333 acres, and includes four departments: the royal gun factories, employed in the manufacture of rifled wrought-iron and steel ordnance, the principal divisions being the rolling and puddling furnaces, the coiling mills, the boring mills, the tanneries, and the steam-hammers, including one of 40 tons; the royal carriage department, for the manufacture of gun carriages, pontoon trains, baggage and store wagons, and ambulances for the sick and wounded; the royal laboratory department, for the manufacture of shot and shell, caps, fuses, etc.; and the ordnance store department of the army, for the supply of every kind of military equipment. Separated from the other portions of the arsenal are the laboratories for the manufacture of rockets and cannon cartridges. The Royal Artillery Barracks, facing the Common, originally erected in 1775, has been greatly extended at different times, and now consists of six ranges of brick buildings, each over 400 feet in length. It includes a church in the Italian Gothic style erected in 1863, a theatre, and a library of 40,000 volumes in connection with the officers' mess room. Opposite the barracks is the memorial to the officers and men of the royal artillery who fell in the Crimean War, a bronze figure of Victory cast out of cannon captured in the Crimea. Near the barracks is the Royal Artillery Institution, with a fine museum and a lecture hall. On the western side of the barrack field is the Royal Military Repository, where all officers of artillery pass a term of instruction. Within the Repository enclosure is the Rotunda, originally erected in St. James's Park for the reception of the allied sovereigns in 1814, and shortly afterwards transferred to its present site. It contains models of the principal dockyards and fortifications of the British empire, naval models of all dates, and numerous specimens of weapons of war from the remotest times to the present day. On the Common is the Royal Military Academy, where cadets are trained for the artillery and engineering services, erected in the castellated style from the design of Sir R. Wyatville in 1801. Within the grounds is a memorial erected to the prince imperial of France, for two years a student in the academy; while near the Rotunda is a monument erected in 1882 to the memory of the members of the royal artillery who fell in the Zulu and Afghan wars of 1879. In addition to the great barracks of the royal artillery there are a number of other barracks, and a permanent camp of huts. At the southeast extremity of the Common is the Hubert military hospital. The parish church of St. Mary Magdalene was rebuilt, in 1726–29, near the site of the old one dating from before the 12th century. The other parishes are Holy Trinity, St. John the Evangelist, and St. Michael's and All Angels. The Goldsmiths' almshouses, originally founded by Sir Martin Bowes, who was lord mayor of London in 1545, and rebuilt in 1771 by the Goldsmiths' Company, are (1888), on the appropriation of the charity to pensions, to be purchased by the trustees of the present parochial almshouses. built by private benevolence. Behind the Royal Military Academy is a mineral well, "the Shooter's Hill waters" of Evelyn. Near Woolwich Common there are brick and tile kilns and sand and chalk pits. In the neighborhood are extensive market-gardens. The town is governed by a local board of health, and is within the jurisdiction of the central criminal court and the metropolitan police. The population of the entire parish of Woolwich (area 1126 acres) in 1871 was 35,557 and in 1881 it was 36,665. The population of the district now included in the parliamentary borough, which comprises the parishes of Woolwich, Eltham, and Plumstead, was 74,963 in 1881.

Woolwich (Wulewich) is mentioned in a grant of land by King Edward in 964 to the abbey of St. Peter at Ghent. In Domesday, where the manor is mentioned as consisting of 63 acres of land, it is named Hulviz. The Roman Watling Street crossed Shooter's Hill, and a Roman cemetery is supposed to have occupied the site of the Royal Arsenal, numerous Roman urns and fragments of Roman pottery having been dug up in the neighborhood. Woolwich seems to have been a small fishing village until in the beginning of the 16th century it rose into prominence as a dockyard and naval station. There is evidence that ships were built at Woolwich in the reign of Henry VII., but it was with the purchase by Henry VIII. of two parcels of land in the manor of Woolwich, called Boughton's Docks, that the foundation of the town's prosperity was laid, the launching of the "Harry Grâce de Dieu," of 1000 tons burden,[1] making an epoch in its history. Woolwich remained the chief dockyard of the English navy until the introduction of iron shipbuilding, but the dockyard was finally closed in 1870. The town has been the headquarters of the royal artillery since the establishment of a separate branch of this service in the reign of George I. An arsenal existed at Woolwich in the reign of Henry VII., and the laboratory is mentioned in 1695. On account of an explosion at Moorfields, the gun foundry was removed to Woolwich in 1716, but the establishment was of minor importance until the commencement of the Napoleonic wars. In 1860 the arsenal was greatly extended. Formerly Woolwich was included in the parliamentary borough of Greenwich, but in 1885 it was made a separate borough returning one member.
